Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

+ *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.

+ *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.

+ *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.

+ *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página `http://books.google.com`

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

SUPPLEMENT TO "THE ELECTRICAL ENGINEER," DEC. 25, 1903.

THE

ELECTRICAL ENGINEER.

A WEEKLY JOURNAL OF ELECTRICAL ENGINEERING,

WITH WHICH IS INCORPORATED

"ELECTRIC LIGHT."

VOL. XXXII. (NEW SERIES.)

FROM JULY 3, 1903, TO DECEMBER 25, 1903.

LONDON:

Printed and Published for the Proprietor by BIGGS & Co., at "THE ELECTRICAL ENGINEER" Offices, 139-140, Salisbury-court, Fleet-street, E.C.

1903.

Digitized by Google

INDEX TO VOL. XXXII. (New Series.)

NOTE.—General Articles, Correspondence, and Companies' Meetings are indicated by heavier type (thus, 290) than the Notes and Business Notes, references to which are shown by light type (thus, 290).

A.

Accidents, 143, 218, 219, 243, 255, 256, 336, 345, 459, 451, 486, 524, 668, 862

Accumulators, etc :
Automobile Cells for Quick Charge Rates, 752
Batteries with One or Two Electrolytes, 271
Edison Battery, The, 189, 496, 709, 836, 905
Grouping of Cells, 728
Home Office Regulations for Manufacture of, 301, 980
Method of Milking Faulty Cells, W. Dalton, 609
Questions and Answers, 362
Sulphating of, 362
Total and Free Energy of the Lead, 749

Addresses, New or Change of, see "Removals"
Aerial Electricity, Mr. Whitney's Idea, 154
Agencies, 623, 704, 746
Air Friction, 531
Alkali, 459
Alternators, see DYNAMOS, ETC.
Aluminium, 2, 21, 24, 342, 422, 447, 460, 482, 512, 789
Ammeter, A Graphic Recording, 756
Ampere, Value of, 225
Appointments, 220; also see PERSONAL
Appointments Vacant, see each Issue
Apprentices, Advancement of, 494
Apprenticeship in Engineering Training, Prof. Cormack, 256

Arc Lamps:
Angold, The, 624
Arons, The, 118
Excelso Flame, The, 622
Gilbert, The, 695, 901
Rignon, The, 973
Siemens's Liliput, 137
Thomson-Houston, The, 585
Union Electric Company's, 205

Aurora Borealis, Electromagnetic Theory of the, 389, 917
Australian Patent Law, 387, 422
Automatic Lubrication, 913
Automobiles, 28, 38, 39, 73, 77, 117, 166, 178, 182, 199, 269, 334, 342, 372, 373, 449, 450, 451, 485, 565, 583, 593, 638, 674, 711, 752, 789, 801, 872, 960

Awards, 153, 225, 544, 897

B.

Balance-Sheets and Reports of Electricity Works:
Aberdeen Accounts, 411
Ayr Tramways Accounts, 588
Barking Accounts, 935
Barrow Accounts, 61
Birkenhead Accounts, 173
Brighton Accounts, 518
Bury Accounts, 61
Cardiff Accounts, 61
Chester Accounts, 257
Croydon Accounts, 96
Doncaster Accounts, 52
Dudley Accounts, 212
Eccles Accounts, 240
Edinburgh Accounts, 617
Fulham Electricity Works, 616
Glasgow Accounts, 329, 365
Gloucester Accounts, 368
Grimsby Accounts, 328
Guernsey Telephone Accounts, 285
Hackney Accounts, 138
Halifax Accounts, 299
Hammersmith Accounts, 328
Hampstead Accounts, 212
Farnworth Accounts, 724
Ilford Accounts, 263
Islington Accounts, 412
Keighley Accounts, 587
Lancaster Accounts, 139
Leigh Accounts, 364
Leith Accounts, 369
Leyton Accounts, 213
Lincoln Accounts, 295
Mexborough Accounts, 330
Newcastle Tramways, 299
Nottingham Accounts, 268
Oldham Accounts, 446
Partick Accounts, 295
Portsmouth Accounts, 588
Rathmines Accounts, 368
St. Annes Accounts, 213
St. Helens Accounts, 617

Balance-Sheets, etc. *(continued)*:
St. Pancras Accounts, 411
Salford Accounts, 587
Shipley Accounts, 247
Southampton Accounts, 328
Stafford Accounts, 138
Stepney Accounts, 296
Stockton-on-Tees Accounts, 60
Swansea Accounts, 138
Tunbridge Wells Accounts, 285
Wallasey Accounts, 368, 892
Wimbledon Accounts, 173
Wolverhampton Accounts, 268
Wrexham Accounts, 60
York Accounts, 725

Ballads of Business, 547, 885
Basalt, Magnetism of, 672
Batteries, see ACCUMULATORS
Becquerel Rays and Water, 341
Bexley Electricity Works, 505
Birthday Honours, 719
Boilers, The Management and Working of, H. Boot, 238

THE

ELECTRICAL ENGINEER.

No. 1, Vol. XXXII. LONDON, JULY 3, 1903. PRICE 3D.

NOTES.

The Marconi Patents.—What promises to be a most interesting litigation, even rivalling that over the Bell telephone patents, is expected to take place in the States before the end of the present year. The *causus belli* is the alleged infringement of the Marconi patents by the owners of the De Forrest patents, who are achieving considerable success with their system in America. The Marconi Wireless Telegraph Company of America are the plaintiffs in the action, and we understand that the matter is being pressed forward with a view to an early settlement of the dispute.

Madras Tramways.—It is stated in *Indian Engineering* that the Madras Municipal Commission has accepted Mr. T. Nunbaramal Chetty's revised scheme for construction, within municipal limits, of a mono-rail tramway on Ewing's patent system. The scheme comprises over 30 miles of line in the municipality of Madras itself and another 20 miles in the adjoining district of Chingleput. But within municipal limits, the line will, *pro tem.*, only carry minerals and parcels, owing to a misunderstanding as to the rights claimed by the electric tramways company.

Overhead Wires in London.—The Borough Council of Poplar have approached the London County Council with a view to the introduction in their General Powers Bill of a clause to prohibit electric current being supplied to consumers within the area of a local authority from an outside source, by means of overhead wires. We may state frankly that the subject does not appeal to us as justifying legislation. Such cases as are referred to are, to say the least, rare, although the Poplar Council complain that several instances have occurred in that borough. But, even so, as overhead wires for the supply of electricity can be erected only in accordance with the regulations of the Board of Trade, we do not see that matters would in any way be improved by legislation.

Honours.—We gather from our American contemporaries that a week or two ago the Columbia University at New York conferred the degree of Doctor of Science on Prof. J. J. Thomson, Cavendish professor of experimental physics in the University of Cambridge. In conferring the degree, President Butler, of Columbia University, welcomed Prof. Thomson as "comrade of Maxwell, Helmholtz, and Kelvin, in the mastery of Nature's intimate secrets, standing as they stood on the outermost edge of the boundary of knowledge." We have great pleasure in offering our best congratulations to Prof. Thomson, whose association with American universities is every day becoming closer. Among those who shared with Prof. Thomson the honour of receiving a similar mark of distinction were Mr. Peter Cooper Hewitt and Prof. Humphreys.

The Pacific Cable Surveys.—In the House of Commons on Friday Sir John Colomb asked the Secretary of State for the Colonies whether he could state if the capital outlay in connection with the Pacific cable included the cost of special surveys made by the Royal navy. Mr. Chamberlain replied that the cost of special surveys was not included. The soundings made by the surveying ships of the Royal navy on the route of the Pacific cable, though of great value, were incidental to and made in the course of their ordinary operations. The special detailed survey required for the determination of the exact route to be followed by the cable was carried out, not by the Royal navy, but by the contractors for the construction and laying of the cable. Mr. Chamberlain added the information that the question of a connection with the United States cable at Honolulu had been raised, but no action had yet been taken in that direction.

Wireless Telegraphy and Lightships.—That the officials of the Board of Trade fully recognise the exceptional claims of wireless telegraphy as a means of communication between lightships and shore stations, is shown by the following statement that was made in the House of Commons on Monday by Mr. Bonar Law. Replying to Major Seely, he said it was proposed, in the first instance, to connect with the shore stations by wireless telegraphy the following six lightships: the East Goodwin, South Goodwin, the Gull, the Tongue, the Sunk, and the Cross-Sand. The matter was being pressed forward, but, as the terms of the contract for the supply of the apparatus have not been settled, he was not able to say when the installation would be completed. The Board of Trade, however, were pressing the matter forward as far as they could, and hoped it would be finished before the autumn.

High-Voltage Transmission.—In a printed reply to a question by Mr. Markham, M.P., Mr. Bonar Law, secretary to the Board of Trade, states that the Board have not yet made any regulations relating to the transmission of electricity at high voltages by bare overhead wires. He has no information as to injury or loss of life to the public caused by bare wires carrying high-voltage supply in America or on the Continent, or as to the relative dangers to the public from wires used for tramways (where constructed under Board of Trade regulations) and from those used for other purposes. Two schemes have recently been submitted, and are now before the Board's electrical adviser, who has been instructed that promoters may proceed with their works step by step under his supervision. The Board propose to give their best consideration to applications for the use of high voltages, dealing with each case on its merits.

Books Received.—Messrs. Harper and Bros., of Albemarle-street, are about to publish "Electrical Engineering," by E. Rosenberg, chief electrical engineer at Messrs. Körting Bros., Hanover. The translation is by Messrs. W. W. Haldan Gee and C. Kingbrunner. The work is an elementary text-book, and is described as being suitable for persons employed in the mechanical and engineering trades and for elementary students of electrical engineering. The published price of the book is 6s.

Digitized by Google

Parts 1, 2, and 3 of a new series of telephone books, entitled "Telephony," by Mr. Arthur V. Abbott, have been published by the McGraw Publishing Company, of New York. They are devoted respectively to the location of central offices, the construction of underground conduits, and to cable plant. The last three volumes, which complete the series, will be issued shortly. They deal respectively with open wire lines, sub-stations and switchboards and the central office. The complete set is published at 24s., or 6s each volume.

Aluminium and Bauxite.—According to the report of Dr. Joseph Struthers, of the United States Geological Survey, the production of aluminium varies very little year by year. Thus, in 1901 the total output of aluminium was 7,150,000lb., while for last year it was 7,300,000lb. The sole producer in the States is the Pittsburg Reduction Company, which has large plants in operation at Niagara Falls and at Shawinigan Falls, Quebec, Canada, and is installing a large plant on the St. Lawrence River in New York State. The chief use of aluminium is for the transmission of electrical currents and for alloys possessing exceptionally physical and chemical properties, though a considerable part of the output is manufactured into domestic articles of various kinds. Two growing uses of the metal are for lithographic work and for the production of intense heat by the combustion of the metal as powder. The production of bauxite in the States during 1902 amounted to 27,274 tons, as against 18,905 tons in 1901, while the world's consumption of bauxite was 43,112 and 36,218 tons respectively.

Platinum Resistance Thermometer.—One of the difficulties to be overcome in constructing a sensitive platinum thermometer is to restrict the size of the coil of wire forming the bulb. In order to have a sufficient length of wire, it is often necessary to make the bulb inconveniently large, and thereby sacrifice quickness of register. A form of thermometer described by Messrs. H. T. Barnes and D. McIntosh overcomes this difficulty to a considerable extent. Briefly, the thermometer consists of two concentric glass tubes fused together at the end, with the wire wound on the inner tube in a thread etched into the glass. The main point about the thermometer is that a core passes through the centre of the bulb, through which the liquid or gas the temperature of which is desired can be made to flow. It is claimed to be quite as easy to construct, if not more so, than the mica-frame type, and it has unquestionably advantages over the latter for the particular use for which it was designed—the apparatus in question was specially adapted for the continuous-flow calorimeter—although it would be unsuited for certain types of temperature measurement.

Electrolysis of Potassium Iodide.—Messrs. F. Foerster and K. Gyr are responsible for the following statements with reference to the electrolysis of solutions of potassium iodide. For the electrolysis of a neutral normal solution of potassium iodide, an anodic potential of 0·52 volt (compared with the hydrogen electrode) is required; this is diminished by the addition of alkali hydroxide. Iodine is first liberated at the anode, and, in equilibrium with it, hypoiodious acid and hypoiodite. In neutral solutions, traces of hypoiodious acid exist in equilibrium with small quantities of iodine and hydroxyl ions in the electrolyte, but the main portion of the hypoiodite formed is at once converted into iodate. In alkaline solutions, the hypoiodite accumulates up to a certain concentration (depending on the concentration, temperature, and current density), which then remains unchanged during the electrolysis, the velocity of its change into iodate being equal to the rate of its formation. In alkaline solutions containing very little iodide, oxygen may be evolved at the anode, especially at higher temperatures and current densities. Periodate is formed only in traces, if at all.

Steam and Electric Traction in Germany.—We understand that next year the Railway Administration in Germany propose to carry out a series of comparative trials with electric automotors and steam locomotives, which will be conducted as follows: Runs will first be made for some weeks with electric automotors only. Then the permanent way will be thoroughly overhauled, and not until this has been done will the trials of the steam locomotives be begun. In this way it will be possible to judge what effect each method of traction has upon the line. But the main object of the trials will be to settle the comparative cost of hauling a given load with each system of traction. The steam locomotives will be of special construction, designed to attain a normal speed of 80 miles an hour, and this is to be capable of being increased to 93 miles. It is even stated that with a load of 90 tons these engines are expected to travel on the level at the rate of 125 miles an hour. Whether this dream of the advocates of steam traction will be realised is a moot point, but in any event the struggle for supremacy between steam and electric traction will be of the highest interest, both from a general and scientific standpoint.

New South Wales Tramways.—The tramways in New South Wales—now an extensive State property—are being converted to electrical working with a rapidity which reflects all credit on those responsible for the work. The total mileage of tramways open and in operation is 122, and of this some 68 miles are worked entirely by electric power, the remaining 54 miles being operated by steam motors, with the exception of a couple of miles run by cable. The ultimate object, of course, is to convert the whole of the metropolitan lines to electric traction. The earnings for the quarter ended March 31 last amounted to £199,769 and the expenditure to £156,987, increases of £26,912 and £25,315 respectively over the corresponding quarter last year. The expenditure per car mile now stands at 10¼d., a decrease of 3¾d., but the earnings per car mile also decreased from 1s. 6½d. in the quarter last year to 1s. 1d. this year. Some 6½ million more passengers were, however, carried this year, which enabled a larger profit to be made. On the whole the State has a very valuable asset in its tramway undertaking, which is every day growing more remunerative, and thus the Commissioners are enabled to make various concessions both to the public and their employés, which are much appreciated.

Rontgen Rays.—A long illustrated article appears in the current number of our medical contemporary the *Lancet* on the use of Röntgen rays in the diagnosis of pulmonary disease. The writer is Mr. J. F. Halls Dally, M.B., assistant resident medical officer, Royal National Hospital for Consumption, Ventnor. He has had great experience in the use of the Röntgen rays, and is thus able to present many interesting illustrative cases of their value in diagnosis. It would appear at first sight as if the Röntgen rays presented a royal road to the art of diagnosis, and that it is now no longer necessary to undergo much clinical labour in order to acquire manipulative and auscultatory skill; but this view is superficial, and the value of the older methods is enhanced by the presentation to the eye of the intra-thoriacic morbid appearances. Hence in many cases one method without the other is incomplete. The author does not claim that Röntgen rays are infallible, but, as in most things, experience leads to more accurate results. From his own experience Dr. Dally concludes that the Röntgen rays form an important

Digitized by Google

adjunct to the methods of physical investigation previously in use, and that by the aid of these rays pulmonary tuberculosis can be diagnosed at an earlier stage than by any other means at present available.

Municipal Tramways Association.—This association will hold its annual conference in Glasgow this year on July 8, 9, and 10. The Executive Committee have arranged the provisional programme. On the morning of the first day the members will be received by the Mayor and Corporation of Glasgow, and the conference will be opened at 11 and proceed all day. In the evening they will be the guests of the Glasgow Corporation at dinner. The next day there will be a meeting of the Executive Committee, a business meeting, and the resumed conference, which will occupy the morning, and in the afternoon a visit has been arranged to the Pinkston power station, carworks, etc. The annual dinner of the association takes place that evening. Among the communications which will be presented at the conference are the following: "Presidential Address," by Mr. John Young; "Report on the Standardisation of Tramway Accounts," by Mr. J. Dalrymple; "Report on the Hours of Labour, etc., of Tramway Employés," by Mr. A. Baker; "Report on Permanent-Way Construction and Maintenance," "Tramway Conditions in America and Great Britain Compared," by Mr. C. R. Bellamy; and "Selection and Training of Motormen and Conductors," by Mr. L. Mackinnon. The conference is likely to be fully attended, a large number of town councils having appointed delegates, and several allied associations have been invited to send representatives.

Our Fiscal Policy.—Amongst business men engineers are not the least important section affected by the possible changes in the fiscal policy of this country as foreshadowed by the Colonial Secretary. Members of Parliament and others interested in the iron and steel, mechanical, and electrical engineering trades are combining in any action that may be decided upon, and the movement was formally started the other day at a preliminary conference held at the House of Commons. The upshot of the proceedings was that the following important resolution was unanimously adopted: "That, having regard to the present public discussion as to possible fiscal changes, it is desirable that a committee of those interested in the iron and steel manufactures and in the construction of all kinds of machinery be formed for the purpose of calling attention to the unfair and illegitimate competition arising from hostile tariffs, trusts, and cartels to which those trades are subjected; and to that end, and in anticipation of possible negotiations with foreign and Colonial Governments, reliable information should be invited from manufacturers to enable Parliament and the country generally to correctly appreciate the serious injury which threatens British manufacturing industries." We hope that manufacturers generally will accept the invitation thus held out to them to supply all the information they may be in the position to offer. Such concerted action as is aimed at above is more likely to make the new movement successful than the mere formal passing of resolutions by individual bodies.

Society of Arts' Conversazione.—The Society of Arts' conversazione at the Botanical Gardens on Tuesday night was an excellent idea well carried out. The weather also continued fine throughout the evening, which was a most enjoyable one. The inner circle of the gardens had been transformed into fairyland, with a central avenue of Chinese lanterns leading to the entrance of the conservatory, where the chairman (Sir William Preece, K.C.B., F.R.S.) and the other members of the council received the guests. Walking in the conservatory reminded one of being on the stage during the transformation scene of a splendid pantomime. There was much to see. The tropical house, containing a banana plant in fruit, the Victoria Regia, and other interesting tropical plants, was open to visitors; a collection of growing and cut roses, and other flowers, by Messrs. William Paul and Son, of Waltham Cross, was exhibited in a marquee on the west lawn; and Messrs. Barr and Sons, of London and Surbiton, had a special display of pæonies and irises, and their fine collection of Japanese dwarf trees aged 50 to 140. H.M. Scots Guards, directed by Mr. Fred. W. Wood, played in the conservatory, and the band of the Royal Engineers on the west lawn, Lieutenant J. Sommer, M.V.O., wielding the staff. Amongst those present we noted Sir Owen Roberts, Sir Owen Burne, Sir Thomas Wardle, Sir Edwin Durning-Lawrence, M.P., Sir John Wolfe-Barry, Sir Thomas Holdich, Sir Henry Trueman Wood (secretary), Dr. C. Le Neve Foster, Mr. Carmichael Thomas, Mr. Lewis Day, and Mr. H. B. Wheatley (assistant secretary).

Electric Traction on Canals.—In the issues of *Zeitschrift für Elektrotechnik* for the 3rd and 10th ult. will be found an illustrated description of a new system of electric traction on canals devised by Messrs. Ganz and Co., of Budapest, and submitted in competition with other systems for use on the Tetlow Canal, in Germany. The writer, in the first instance, refers to the disadvantages of the present systems, which are chiefly that the cost of road construction and maintenance of the rails on the towpath are high, and that the vibrations of the locomotive throw a great responsibility on the driver. If two rails are used on which the locomotive runs, the road-bed construction is less expensive, but there is the serious disadvantage that the adhesion is not sufficient for dragging heavy boats, unless very heavy locomotives are used; the road-bed construction becomes still cheaper if a single rail is used, but the adhesion difficulty is still in existence. This difficulty is claimed to be overcome by means of an idea of Fabre, developed by Messrs. Ganz. Instead of the usual two-wheel axles, each with two vertical wheels, they use two-axle pairs inclined against one another; on each axle a wheel is mounted, and each pair of two such wheels grips the single rail. To support the locomotive, one broad lateral wheel is provided which runs on the road. The purpose of this arrangement is to increase the adhesion and stability of the locomotive. The construction is described in detail and illustrated with diagrams. The author finally compares the cost of this system with that of three others designed for the same canal, which has a length of 2 miles, with an annual traffic of 1,500,000 tons. In the cost of operation the price of 1½d. for one kilowatt-hour is assumed. The first cost is given as follows: for the Siemens and Halske system, £125,000; the Rudolf system, £129,800; and the Ganz system, £50,399.

Dust-Arresting Respirator.—In the early part of the year we referred in these columns to the offer of a prize by the Society of Arts for a respirator intended to arrest dust in the various industrial processes in which the health of the workpeople suffers from their being forced to breathe a dusty atmosphere. The offer was made under the Benjamin Shaw Trust, the prize being a gold medal or £20 in money. We have not as yet heard that inventors have been particularly attracted by the offer, but as the competition will be open until Dec. 31 we trust that the Society of Arts will find plenty of competitors for the prize by the end of the year. The object is an exceptionally worthy one, and a successful apparatus would supply a want that has been felt for many years. It is interesting to note that as early as 1822 a protective device known as a magnetic guard gained for its inventor, Mr.

Digitized by Google

J. H. Abraham, of Sheffield, the society's gold medal. The apparatus included a respirator to cover the mouth and nose. This respirator was fitted with magnets for the purpose of arresting the fine particles of steel thrown off in the process of pointing needles, and in other processes of dry grinding. Although the invention was greatly appreciated at the time, it appears never to have come into practical use, the main objection to it having been, it is believed, raised by the workpeople themselves, who feared that the lessened risk attached to their employment would lower their wages. We do not believe that any such prejudice would be raised at the present day, but similar considerations have stood in the way of the introduction of various appliances intended to lessen the risks associated with all trades in which the workpeople breathe a dusty atmosphere. It is hoped that the present offer of the Society of Arts may draw the attention of inventors to the matter, so that it may result in the production of some suitable piece of apparatus, despite the difficulties with which the solution of the problem is surrounded.

Society of Arts.—The annual report of the council of the above society speaks in high terms of praise of Prof. J. A. Fleming's course of lectures recently delivered by him on the subject of "Hertzian Wave Telegraphy," and duly recorded in this journal. The report describes the course as "one of the most attractive and interesting which has ever been delivered in the society's theatre." It formed the best popular description of wireless telegraphy in principle and in practice that has yet been published. In the words of the report: "Prof. Fleming is a strong advocate of the Marconi system, and his relations with the Marconi Company enabled him to carry out for the purpose of illustrating his lectures a very striking series of experimental tests demonstrating the non-interference of the currents used in Transatlantic telegraphy with those for communication over a shorter distance, and, in the lecturer's opinion, demonstrating the value of the syntonic system of Marconi." The council's report also records the fact that Mr. Alfred C. Eborall has been awarded the society's silver medal for his paper on "Application of Polyphase Motors to the Electrical Driving of Workshops and Factories"—"a valuable, if somewhat technical, discussion of the class of motors best suited for the electrical driving of workshops and factories." Prof. W. Smart has also gained the silver medal for his paper on "Industrial Trusts," while Mr. Gabriel J. Morrison has scored a similar success for his contribution on "The Construction of Maps and Charts." With regard to the constitution of the executive for the ensuing year, the new vice-presidents are the Lord Chancellor, Lord Kelvin, Sir Wm. H. Preece, and the Lord Mayor of London. The Lord Chancellor and Lord Kelvin have both served on the council on previous occasions. Sir Marcus Samuel has not. Sir Wm. Preece has served for the past four years as a member of the council, from which he now retires. The new members of council are Mr. Henry H. Cunynghame, C.B., Sir Robert Giffen, Lord Harris, and Sir Thomas Holditch. Sir Wm. Preece is followed in the chair by Major-General Sir Owen Tudor Burne, G.C.I.E., K.C.S.I.

Depreciation of Plant.—Mr. Shirley Price, M.I.E.E., was on Monday a witness before the Joint Committee of both Houses of Parliament appointed to enquire into the question of municipal trading. His evidence was mainly directed to the problem involved in making proper provision for depreciation of plant. He cited many cases of depreciation of machinery in order to make clear his point that the units forming a manufacturing concern should never appear in the accounts except at the price they were actually worth, regardless of the original cost. For instance, an electric lighting station which cost £50,000 10 years ago would not be worth half that now. Then all working charges, such as rent, rates, taxes, maintenance, etc., must be written off before any genuine profit was made. He took it, with regard to sinking fund, that that was provided to pay back loans, and not to replace depreciated machinery. He knew of no private concern which had such an item as a sinking fund, except for special conditions, such as the termination of leases, etc. Depreciation went on, however well the plant might be maintained, although, of course, it might be accelerated or retarded by the method of maintenance. With regard to the method of arriving at depreciation, it was only possible to deal with it accurately in one way, which was by actual examination by an expert valuer. He had not heard of any corporation which had adopted that system, but it was a common custom for high-class engineering firms to have periodical valuations. He had known a battery of boilers costing thousands of pounds destroyed in 18 months by bad water. If high-class firms, whose directors were trained to the business, felt it necessary to have periodical valuations, so as to write off the proper amount of depreciation, certainly it was more necessary in the case of municipal undertakings. The great objection was that of expense. In the case of Leeds, for example, he should think approximately the cost of such a valuation would be 2,000 or 3,000 guineas the first time, and £600 or £700 afterwards. In conclusion, Mr. Price advocated the employment by the Government of expert valuers who would be invested with power to value the corporation undertakings periodically, and to compel the writing off of depreciation.

International Telegraph Conference.—Delegates to the International Telegraph Conference are finding plenty of interesting diversion from their labours in the number of social functions provided for their entertainment. On Monday night the principal submarine cable companies—representing some 190,000 miles of cable—"fêted" the delegates at the Royal Botanic Gardens. The function was in the nature of a celebration of the forty-eighth anniversary of the first telegraph convention, which was held on June 29, 1855. It was an ideal summer's night, and the beautiful gardens looked their best lit by hundreds of multi-coloured lamps. The visitors found varied entertainment in the musical and other performances provided, which included the band of the Irish Guards. Sir John and Lady Denison-Pender received the guests, among whom were the representatives of Germany, Spain, Denmark, India, New Zealand, and Australia, and Sir Wm. Crookes, Prof. Ayrton, Prof. Perry, Sir W. H. Brooke, Sir H. Murray, Sir J. Wolfe-Barry, Sir H. C. Mance, Sir H. Tozer, Sir Wm. Preece, and many others. At the invitation of the directors of the India Rubber, Gutta Percha, and Telegraph Works Company, Limited, of Silvertown, delegates, numbering about 350, paid a visit to Warwick Castle on Saturday last, where they were received by the Earl and Countess of Warwick, and conducted over the castle and grounds. Lord Warwick welcomed the visitors on behalf of the Countess and himself, and M. Sins, the French delegate, replied on behalf of the visitors. A picnic luncheon was afterwards given in the park of Warwick Castle. To the directors of the India Rubber, Gutta Percha, and Telegraph Works Company, Limited, much praise is due for the admirable arrangements made for the comfort of the visitors, who were conveyed to Warwick by special trains from Paddington and Euston Stations. One party travelled to Warwick by Great Western Railway, returning *vid* London and North-

Digitized by Google

Western Railway, and another by London and North-Western Railway, returning *viâ* Great Western Railway, which gave both parties the opportunity of seeing more of the country. During the afternoon the delegates drove to Stratford-on-Avon. Musical selections were given by the band of H.M. Scots Guards, and songs and choruses rendered by Madame Novello Davies's glee party. The foreign delegates were loud in their praises of their visit to Warwick Castle and the manner in which they were entertained.

Technical Training.—The munificent offer which Lord Rosebery has been privileged to make to the London County Council on behalf of certain public-spirited men of a grant of money for the establishment in the Metropolis of a national technical school, will be received with no mixed feelings by engineers. We in this country have long felt the want of such an institution, one that will provide adequate means for imparting to our young men an education of the highest order in technical and applied science, which will do for us what the technical high schools of Germany, Austria-Hungary, and Switzerland are doing for the youth of those countries. The proposal, which Lord Rosebery has communicated to Lord Monkswell as the head of the authority for technical education in London, is one which opens the way for the London County Council to bring technical instruction in this country at least up to the level of that provided by our Continental neighbours. As Lord Rosebery truly says, "A London Charlottenburg" is what we want, and the present opportunity is one which we expect to find will be eagerly seized upon by the London County Council. Indeed, the origin of the scheme may be indirectly traced to the report of the Technical Education Board for London last year. The connection between the present proposal and this report may be seen from the fact that one of the trustees of the proposed institution (Sir Henry Roscoe) strongly recommended the scheme in question to the committee which produced the report. The institution, when complete, together with the site, which is expected to be provided by the Royal Commissioners of the 1851 Exhibition at South Kensington, would represent a value of about £500,000, about £300,000 of which would be provided by the promoters, who include the great South African firm of Messrs. Wernher, Beit and Co., Lord Strathcona, Sir Ernest Cassel, and others. The London County Council are asked to provide an annual sum of £20,000 for the maintenance of the educational work of the proposed institution. As to the details of the organisation of the school, these have yet to be settled. But the proposal at present is that, whilst working in close co-operation with the Royal College of Science, the Central Technical College, and other branches of the London University, it should be organised as a distinct "school" of the university under the management of its own committee. Lord Rosebery's idea is that the new institution should supplement the provision made by other establishments for technical education by taking up subjects as yet undealt with, or only inadequately served. Such subjects would probably include, among others, chemical technology, mining and metallurgy, electro-chemistry, electric traction, and kindred subjects. The intention is to admit only advanced students able to profit by the instruction and facilities for original research which will be provided, but the institution will be made accessible by low fees and scholarships. The matter now rests with the London County Council, acting as the technical education authority for London, to whom the promoters look for the annual support of the institution to the extent indicated.

City and Guilds Institute.—A copy of the document issued annually by the City and Guilds of London Institute has just reached us. It includes the report of the council on the work of the institute for the year 1902, together with a number of subsidiary reports and appendices, and is dated April, 1903. The first item of importance in the council's report is the record that Sir John Wolfe-Barry, K.C.B., F.R.S., has accepted the office of chairman of the executive committee in the place of the late Sir Frederick Abel. The council at once proceed to indicate the direction in which the work of the institute is increasing and the needs of the immediate future. At the Central Technical College the congestion experienced a few years ago, owing to the rapid development of electrical science since the college was built and the steady increase in the number of qualified candidates seeking admission, has been met by leasing adjacent premises. There remain, however, many directions in which the curriculum of the college must be extended before it can cover adequately the subjects included in the faculty of engineering in the university. But neither the present accommodation nor the present staff is sufficient to allow of any substantial increase in the subjects included in the courses of study. There is also the important question of further extending the regular courses to a fourth or post-graduate year. Of the needs of the technical college at Finsbury, reference is made to the anonymous offer of £10,000 which has been made towards the extension and better equipment of the college provided that an additional £20,000 can be raised. Of this latter sum over £8,000 has been provisionally promised by the Livery companies. Reverting to the Central College, it is noted that Prof. Unwin succeeds Prof. Henrici in the deanship for the current session. Passing on we find a reference to the arrangement made with the London University under which Prof. Unwin became an "appointed teacher of the university," and the university agreed to devote £1,425 a year for the extension of the work of the engineering department of the college. As showing the development of engineering science during recent years, the council remark that the engineering faculty of the university will in all probability soon take a foremost position in the university as regards the number of its students. As for the Central Technical College, the number of students taking instruction in electrical engineering in the year 1901-2 was greater than in any other department. Thus 119 attended the electrical engineering course, 116 the civil and mechanical engineering course, 25 the chemical course, and 24 special courses—a total of 284. The college now being a "school of the university," a scheme has been prepared and accepted by the Senate of the university, under which the latter associate outside examiners with the professors of the college, and accept the ordinary college examinations for first year students as the intermediate examinations of the university for the degree of B.Sc. in engineering. The research fellowships provided by the Salters' and Leathersellers' Companies for award at the Central College became vacant last year, and have been awarded to E. Frankland Armstrong, Ph.D., and Wm. Robertson respectively. In the report of the principal on the work of the Finsbury College in the last session, it is shown that of a total number of students of 211, some 110 attended the electrical department, 62 the mechanical, and 39 the chemical department. A number of interesting extracts from some of the examiners' reports on the results of the examinations of 1902 are also given, but space forbids our referring to them further than to say that they indicate the high standard of instruction which the City and Guilds of London Institute offers to young men, especially to those who are entering on an engineering career.

ON BOOSTERS.

BY G. STEPHENS.

A prominent auxiliary in modern generating stations is a booster, owing to the many uses to which it can be applied; yet, in spite of its large adoption, almost everyone of these machines has a feature peculiar to itself. Generally speaking, a booster is a generator used for altering the potential of a circuit, its armature being connected in series with that circuit, and revolving in a field excited in various ways. The chief advantage of a booster is to save copper at the expense of power generated. It is usually motor driven, and when used in connection with a three-wire system the balancer is often used to drive it, thus doing away with the necessity of a separate motor and forming a set of four machines on one shaft. Possibly the most general work to which it is applied is in connection with accumulators, and in dealing with this subject it is first of all necessary to consider the conditions under which batteries are worked. The usual voltage

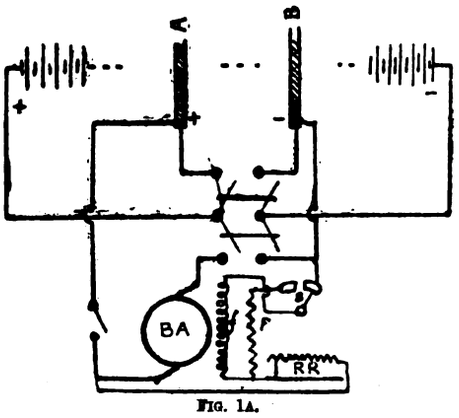

FIG. 1A.

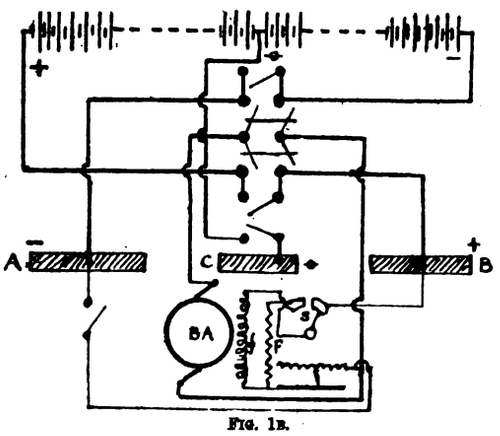

FIG. 1B.

Regulating cells are not shown. A, B, and C, arc-lighting 'bus bars; B A, booster armatures; *f*, booster field; F, shunt discharge coil; S, Shunt switch; R R, regulating resistance.

of a single cell when fully charged is 2·5, and the lowest to which it should be allowed to fall is 1·9. On this account, in a lighting station the battery is often divided into two parts, the main battery consisting of a number of cells which when fully charged will give a voltage equal to that of the 'bus bars, and in addition to these a number of regulating cells are provided sufficient to make the whole number in the battery equal to the figure obtained by dividing the 'bus-bar voltage by 1·9, this number being required in order that the total voltage of the battery when fully discharged will not fall below that of the 'bus bars. When the whole battery is fully charged its voltage will be considerably above that of the 'bus bars, and, therefore, to charge it a higher voltage than this is required. There are two methods of charging a battery: one is to disconnect it entirely from the 'bus bars and connect it across charging terminals at a higher voltage, while in the second case it is connected to the charging terminals and a less number to the 'bus bars, the regulating cells being cut out as they become charged and as the battery voltage rises. The higher voltage between the charging terminals is obtained either by a separate generator or by a booster. The connections in the latter case are given in Fig. 1, from which it will be seen that the charging current passes through the booster armature, where it is raised to the required voltage, the field being connected in series with an adjustable resistance across the 'bus bars. The diagram A shows a simple two-wire system, while B gives a three-wire system. It will also be noticed on reference to B (Fig. 1) that either half of the battery can be charged separately or both together. The method of connecting up the booster when the battery is arranged so that it can be connected to the 'bus bars and be charged at the same time is similar to that shown in Fig. 1, the difference only being in the battery connections and switches. In both

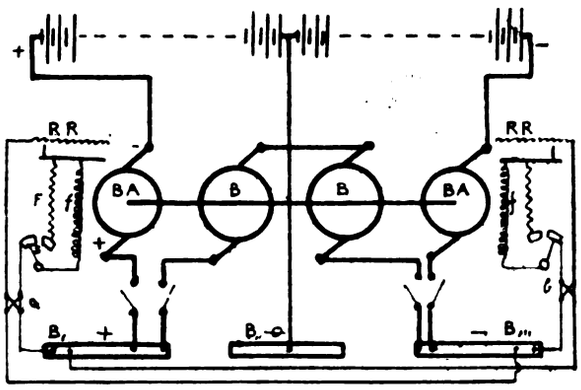

FIG. 2.—B A, booster armatures; B, balancers; B_I, B_{II}, and B_{III}, 'bus bars; S, field switches; *f*, booster fields; F, field discharge coils; R R, regulating switches.

these methods heavy leads and regulating switches are necessary, capable of carrying the maximum charging or discharging current, and these will cost a considerable sum, for in good practice one lead is used for every two regulating cells, so that the difference in potential between any two adjacent contacts on the regulating switches will not be much over four volts. Efforts have been made to reduce the cost of the regulating leads by fixing the regulating switches in or near the battery-room and connecting them mechanically to hand-wheels on the switchboard, but such an arrangement has many objections and cannot be considered satisfactory. Boosters have been designed not only to take the place of the regulating cells, but also to raise the

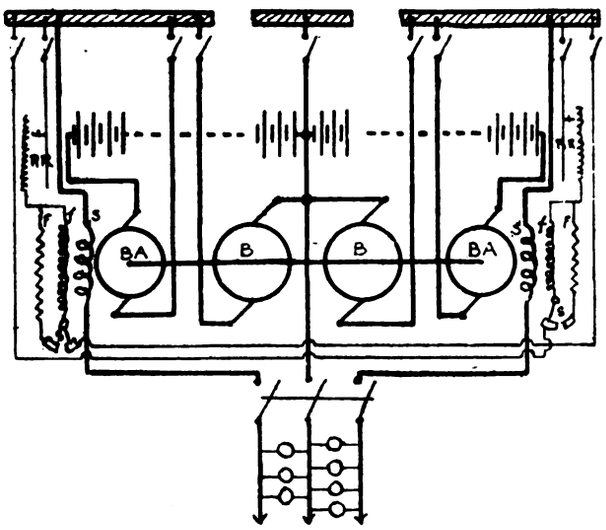

FIG. 3.—B A, booster armatures; B, balancer; B_I, B_{II}, and B_{III}, 'bus bars; S, series field coils; *f*, shunt field coils; F, field discharge resistances; R R, shunt regulating resistances; *s*, field switches.

voltage of the 'bus bars sufficiently to charge the batteries when required. This arrangement in connection with a three-wire system is shown in Fig. 2; two boosters are used and are driven by the balancer. The fields of these boosters are hand regulated and connected to the lighting 'bus bars; the current in them can be reversed by the switches marked *a b* when the battery requires to be charged. Boosters of this kind require continual attention if the load varies at all in order to keep the voltage constant, but in spite of this they are preferred by many to the automatic booster shown in Fig. 3.

This automatic booster is almost entirely independent of

Digitized by Google

attention, but, like most so-called automatic machines, it cannot be depended on too much. Its field magnets are fitted with an additional coil, through which all or part of the main current leaving the station passes. This coil is connected in such a way that it works in opposition to the shunt coil, and so assists and retards the discharge of the battery according to the load. The current going through either coils can be adjusted by the resistances shown in the diagram. In traction work the usefulness of the automatic booster is more evident, for by its adoption the generating sets are run at a constant and economical load, the battery taking up the irregularities characteristic of such work.

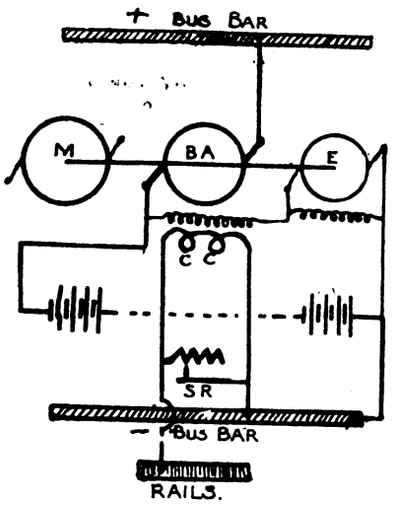

FIG. 4.—M, motor; B A, booster armature; E, exciter; C C, compounding coil to increase line volts as the load increases; S R, shunting resistance.

Fig. 4 gives the connections of the Highfield automatic reversible booster for use in conjunction with a battery for tramways. This booster consists of three machines—a motor, a boosting generator, and an exciter—all directly connected. The exciter is for exciting the magnets of the boosting generator. Its armature leads are coupled, one to the battery negative terminal and the other to the magnet coils of the boosting generator, the other terminal of the magnet coils going to the positive battery terminal. In this way the current in the magnet coils depends on the difference in potential between the exciter and the battery terminals, and should these be equal the booster will give no pressure; but as soon as one rises above the other, the booster will generate in proportion

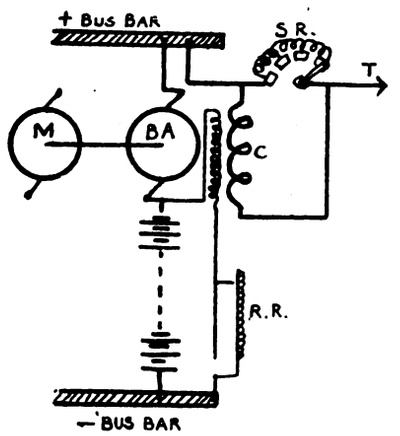

FIG. 5.—M, motor; B A, booster armature; R R, shunt regulator; C, series field coil; S R, shunting resistance; T, Feeder to trolley wires.

to the difference between them and in the direction to charge the battery if it is the lower and *vice versâ*. The booster thus follows the variations of the battery, maintaining a constant load on the generators and a constant pressure on the line. The other connections can be easily understood by referring to Fig. 4. Another type of booster for the same use as the one just described is shown in Fig. 5. It is the Chelmsford reversible booster, and is similar in some respects to those in Fig. 3, its action being as follows: When the external load is equal to the normal full load of the engines the battery will neither be charged nor discharged, as the series coils of the booster through which some or all of the main current flows (as desired) will then just neutralise the magnetising effect of the shunt coils, but when the load becomes greater the series coils overcome the shunt coils, causing the battery to discharge and assist the engines. When the external load falls below the normal full load of the engines, the reverse action takes place, the shunt wind overpowering the excitation due to the series coils, reversing the polarity of

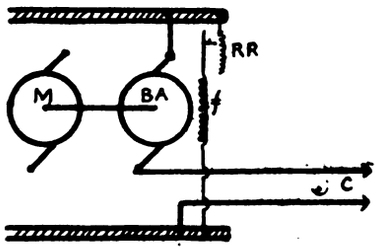

FIG. 6A.

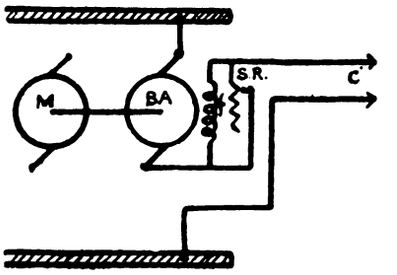

FIG. 6B.

M, motors; B A, booster armatures; *f*, field coils; R R, regulating shunt resistance; S R, shunting resistance; C, Feeders.

the booster and causing the battery to be charged. The point at which the reversal takes place can be varied by altering the resistance, shunting the current from the series coils, or by altering the resistance in circuit with the shunt coils, or both.

In supplying a district some distance from the generating station, another function of the booster is met with. To prevent a considerable fall of potential, the cables

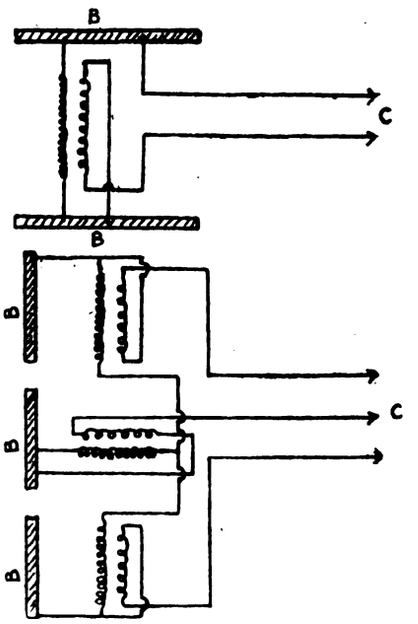

FIG. 7.—B, 'bus bars; C, feeders.

installed must be of large cross-sectional area, and consequently the outlay is excessive. To reduce this expense smaller cables are used, and to compensate for the greater drop the voltage at the station end is raised by means of a booster, the details of which are given in Fig. 6. The field is excited off the main 'bus bars, its strength being regulated by a rheostat to give the desired voltage at the booster terminals Another and preferable method of exciting the field is to connect it in series with the feeders and armature, in which case it is almost entirely automatic, the volts generated by the booster varying with the current

Digitized by Google

in the feeder, as do also the volts lost in the feeder. To afford additional regulation the field is shunted by an adjustable resistance (see Fig. 6B). A single-phase and a three-phase alternating-current booster for use in power transmission schemes are shown in Fig. 7, by which they can be easily understood. Their construction is similar to a static transformer having no moving parts and requiring little attention. The primary coils are connected across the high-tension 'bus bars while the secondaries are put in series with the feeder to be boosted.

In a tramway system where the rails form the return conductor, the Board of Trade enacts that the greatest fall in potential on the rails shall not at any time be over seven volts. In any extensive scheme the rails are not sufficiently good conductors to keep within this limit, and to do so cables are run to distant points of the lines, and being connected in parallel with the rails improve the con-

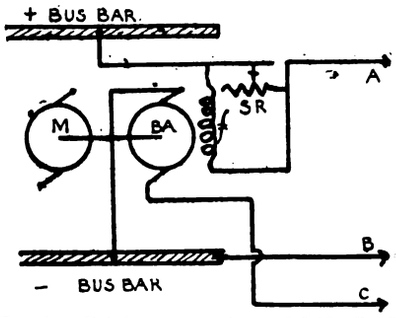

FIG. 8.—M, motor; B A, booster armature; *f*, field coil; S R, shunting resistance; A, feeder to trolley wire; B, to rails; C, booster feeder.

ductivity of the return circuit. These cables are an expensive item, as owing to the good conducting powers of the rails themselves they must be of large sectional area in order to make any appreciable improvement in the return circuit. To reduce this expense, Mr. Parshall designed a booster which is connected as in Fig. 8. The positive pole of this machine is connected to the negative 'bus bar, and the negative pole to a point about two-thirds of the distance from the generating station to the end of the line by means of a special cable. The field coils are connected in series with the positive line feeder going to the district to which the booster feeder is connected, and is thus excited by the current that supplies the cars on that line. In this way the voltage generated by the booster is automatically caused to vary with the load on the particular section to which it is connected. The action of this negative

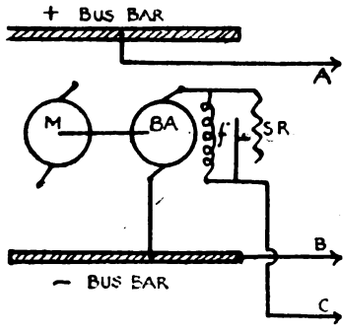

FIG. 9.—M, motor; B A, booster armature; *f*, field coil; S R, shunting resistance; A, feeder to trolley wire; B, to rails; C, booster feeder.

booster, as it is termed, is to reduce the potential at the station end of the booster cable below that of the rails at the station, and thereby drawing, as it were, back more current by that cable than would otherwise return by it, thus reducing the current returning by the rails. Its effect is such that the current returning by the cable is $\frac{e+AR}{r+R}$, whereas if no booster is used it would be $\frac{AR}{r+R}$, where A = total current in the return circuit of the section; e = voltage of booster; r = resistance of the booster cable and armature; R = resistance of rails.

In installing a booster the voltage it should generate can be found from these formulæ; thus $e = C(R+r) - AR$, C being the current to be returned by the cable. An additional shunt coil is sometimes added to the field magnets to give a greater range of voltage. Another method of connecting the negative booster is as in Fig. 9. In this case it is a simple series generator, which is in most cases to be preferred, as with it the current returned by the cable is proportional to the potential at the end of the cable connected to the rails, and it is not always possible to have a positive feeder in which the current varies with the fall in potential on the rails of a section.

THE DESIGN OF EXTRA HIGH TENSION SWITCHGEARS.

BY W. E. WARRILOW.

The most natural outcome of the development of the electrical industry is undoubtedly the concentration of large power sources into common centres, whence energy for both power and lighting purposes is radiated to supply areas many miles distant. One of the chief reasons for this course is to be found in the fact that the spots where natural power is available are generally remote from populated districts, and it has been necessary to adopt means for the transmission of power over long distances in order to establish a supply at all; further, the economies possible in high-pressure generation and transmission, with low-pressure distribution, have done much to lessen the opportunities the smaller undertakings have had of paying their way, and in view of these circumstances the laying down of extra high pressure schemes has resulted as a matter of course.

However, interwoven with this development have been the difficulties which always assail innovations of any description, and as we may discern in the evolution of the individual the evolution of the race, so it is possible to trace in the history of the earliest stations, and the larger ones now springing into prominence, parallel obstacles which have cropped up. In the first case, the chief enemy to deal with was the man in the street, who knew nothing of problems in electrical engineering, and considered that every effort was being made to impose on his ignorance of such matters. It is common knowledge how his prejudices have been broken down, and, as a result, attention can be drawn to so many successful undertakings in daily operation for the supply of light and power. In the second instance, the struggle has assumed quite a different aspect, the ground of contention being raised to much higher levels—in fact, to nothing short of the camp of the electrical engineers itself. Not only was there considerable passage of arms as to the economy, or even the feasibility, of such undertakings, but also the relative merits of single *v.* polyphase currents occasioned great strife among electricians, and many alarming statements were given vent to, in the full belief that they could not be otherwise than correct. The wheels of progress have, nevertheless, rolled over this rough ground, and now that the worst of the preliminaries are over and extra high-pressure work is becoming crystallised into definite forms, there is reason to doubt the credence given to the alarming views then expressed.

The problems directly associated with the production, transmission, and distribution of high-potential alternating currents have proved of a very fascinating character, chiefly because they are connected with phenomena hitherto confined, on a smaller scale, to the laboratory, and also because it has been unnecessary to turn much attention to the design of the plant itself, the principles underlying this having been long since understood and established in practice. Insulation troubles at either alternator or transformer have proved no mean task to encounter and overcome, but success has attended most of these labours and definite standards are now in common use. Power-station equipment at almost any voltage can be entertained and ultimately put to work, and the electrical world, much less the man in the street, has almost forgotten that its lights or trains are dependent on some such station many miles distant. Still, in spite of this marked advance, the work in hand is largely reliant on mere experiment, and as long as the human element has to be considered as part of a scheme, the safety of operators must rank high in the criticism of all apparatus needing attention at times when

Digitized by Google

danger is most imminent. It is on the design of the controlling apparatus—the switchgear—that a scrutinising eye must be cast, as this section of the plant performa the most important function among all others in the station. It is needless to point out that when the energy corresponding to thousands of horse-power, and in its most intangible form at that, is concentrated into the space of a few square feet, the consequences of breakdown are so disastrous as to threaten the electrical and commercial life of the undertaking on their occurrence. It is interesting to note that whereas the design of generators and their prime movers is practically standardised, much diversity of opinion is to be seen in the controlling gear by the many varieties of apparatus constructed for use on switchboards. Continued experience with certain types, however, is indicating defects

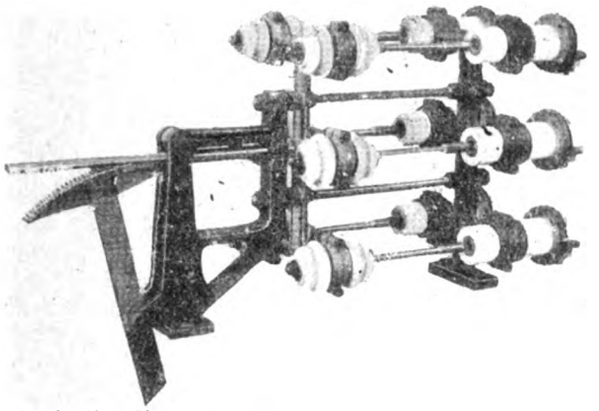

FIG. 1.—Three-Phase Switch, pressures to 10,000 volts (Oerlikon Co.).

in their design, and they are being "weeded out" to make room for more efficient goods, to the advantage of all concerned. In fact, there is hope that few more years will elapse before the principles underlying switchgear design will have become firmly grounded, and the control of high-pressure currents be conducted with absolute safety to attendants and perfect freedom from fire or interruption risks.

The coincidences in the evolution of the extra high pressure station and that of the pioneer undertakings mentioned above are especially noticeable in the design of the controlling gear, and it is highly probable that the outcome of each will be the same. In view of the high potentials dealt with, it has been thought necessary to spread out the gear to ensure isolation in case of fire, and many stations are equipped on these lines, the switchgear occupying a great portion of one of the station walls. Subsequent experience has illustrated that, in spite of the voltage, concentration within certain limits is possible and safe, so that the economies in wall space which are thus obtainable should ultimately cause preference to be given to this type of board. In the field of medium pressures the cellular type of gear seems to be more generally employed than any other, in this country at any rate, and its claim to this position can be directly based on its compactness and safety. It has replaced many boards of other makes which have been voted dangerous and have taken up more room, but it has only done so after the most exhaustive experiment and subsequent to continued manifestation of superiority. It may be said to represent the result of evolution in switchgears for the control of such pressures, and it will be interesting to note the consequences of its introduction into extra high potential work.

At the present time the gears for dealing with these voltages are varied in design and assembly of parts, though they are easily classed under two heads: (1) gears with backs; (2) gears without backs, the boards for distance control being also included. The examples described hereafter may be taken as representative of either of these designs, and they will serve to illustrate the developments which have resulted from but a few years' experience. It will also be noticed that considerable difference of opinion exists among manufacturers as to the best methods of assembling the gears, as well as in the design of the apparatus making up the various panels. Although the oil break fuse and switch have come into extended use on gears controlling medium pressures, and have proved their superiority over the air break, this latter type of switch is to be found among the designs put forward

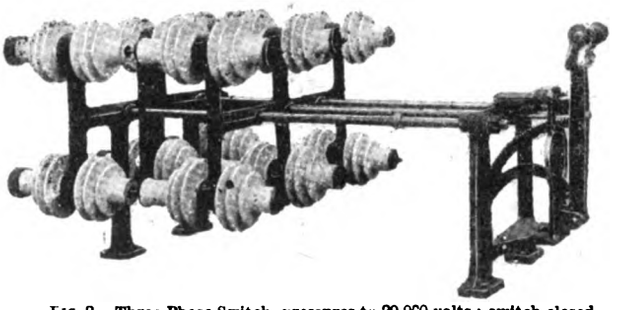

FIG. 2.—Three-Phase Switch, pressures to 20,000 volts; switch closed (Oerlikon Co.).

for dealing with extra high pressures, and quite a number of stations are running with apparatus of this description, though subsequent experience has illustrated that the oil break for either fuse or switch answers the purpose best.

The Oerlikon Company, Zurich, have had considerable experience in switchgear design, and favour the air break switch for pressures up to 20,000 volts, even at this potential finding no difficulty in breaking the circuit. Fig. 1 illustrates a switch of this type for three-phase working up to 10,000 volts, the photo showing the device in skeleton form complete for mounting in the most convenient position on or near the switch panels. It comprises a combination of simple castings carrying porcelain insulators in which the conducting portions of the switch are cemented. The back set of contacts are fixed to a frame provided with holders which clip the porcelain tubes, and the whole is bolted to the frame of the gear or the wall. Two guides are fixed to this back holder, and they serve the double purpose of acting as slides for the moving contacts of the switch and supporting the rack and sector gear which is connected to the operating lever on the face of the board. The sliding contacts are carried in porcelains in the same way as the fixed set, and two prongs per phase are fitted, which provide a double break, the terminals of the switch being screwed to the fixed contacts on the back frame. These latter comprise metal tubes embedded in porcelain, the whole, with terminal, being clipped to the carrier. The sliding contacts with spring plugs are arranged to enter the tubes, closing the circuit through the prongs on the moving carrier. No quick break is provided, but the arc is

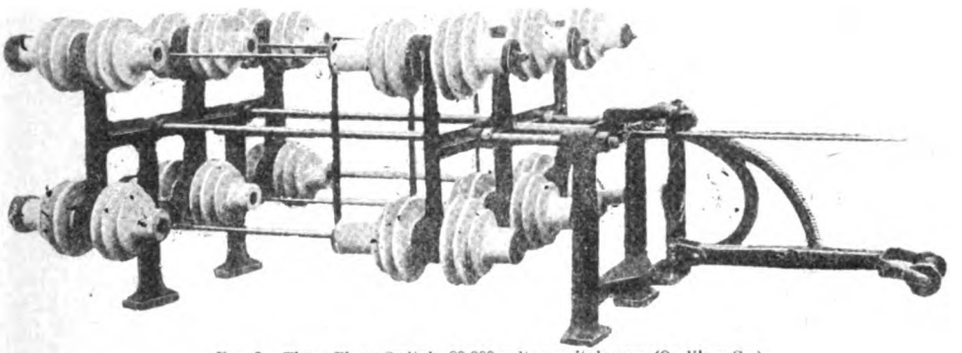

FIG. 3.—Three-Phase Switch, 20,000 volts; switch open (Oerlikon Co.).

Digitized by Google

ruptured in the tube as soon as the contacts are separated, the space in the tube not allowing the entrance of sufficient air to maintain the arc. Fig. 2 shows the same design of switch in the closed position suitable for pressures up to 20,000 volts, the operating handle being also included. The same switch open is illustrated by Fig. 3, and the larger leakage surface of the insulators can be clearly seen in this particular design. In all these types the actual switch can be placed in any position as long as space will permit of its being linked up to the front of the board for operating purposes.

(To be continued.)

THE PRESENT POSITION OF THE THEORY OF ELECTROLYSIS.*

BY W. C. DAMPIER WHETHAM, F.R.S., MEMBER.

When, early in the nineteenth century, the attention of physicists and chemists was directed to the newly-discovered phenomena of electrolysis, an explanation had immediately to be found for the striking fact that the products of decomposition appeared at the electrodes only, while the body of the solution was unaltered. It was seen that a continual passage of the opposite constituents of the electrolyte in opposite directions through the liquid must be going on, and the chain hypothesis of Grotthus was long accepted as a true picture of the means by which that passage occurred.

About 1830 Faraday by accurate quantitative measurement threw new light on the subject, and proved that a definite electric transfer always accompanied a given amount of chemical decomposition. The process of electrolysis now appeared as a kind of convection—a stream of positively electrified cations drifting in one direction, and a stream of negatively electrified anions drifting in the other, under the influence of the E.M.F.

The next step was made in 1853 by Hittorf, who directed attention to the unequal dilution of the solution round the two electrodes, and showed that it could be explained either by the existence of complex ions, by means of which unaltered salt or solvent was dragged to one or other electrode, or by an unequal velocity of movement of the opposite ions. If in any given case we assume or can prove that no complex ions exist, we can calculate the ratio between the velocities of the cation and the anion, for this ratio will be the same as that between the amounts of salt lost by the solution from the neighbourhoods of the anode and the cathode.

In order to determine the absolute velocities with which the two ions move under a given force, it was necessary to discover another relation between those velocities. This was done by Kohlrausch, who pointed out that, on the convective idea of electrolysis, the total electric transfer per second through the solution, or the current, must be equal to the product of the number of ions, the charge on each of them, and the velocity with which they move relatively to each other—that is, the sum of their opposite absolute velocities. Now Kohlrausch had already described a satisfactory method of measuring the electric resistance of electrolytes by the use of alternating currents and a telephone, and had shown that when the reverse E.M.F.'s at the electrodes were eliminated the conduction of the current conformed to Ohm's law. The current through the solution would therefore be equal to the product of the conductivity and the potential gradient, and thus a relation was deduced between the molecular conductivity and the sum of the opposite ionic velocities under unit potential gradient, quantities which are known as the ionic mobilities. Combining these results with Hittorf's migration numbers, the absolute values of the ionic mobilities were obtained. Kohlrausch calculated many such mobilities, and showed that, in general, they increased with the dilution of the solution. When several salts containing a common ion, as, for instance, the chlorides of the three metals—potassium, sodium, and lithium—were examined, it was found that the values of the mobilities of the common ion chlorine, which differed in the three salts at moderate concentrations, approached each other as the dilution increased, and became identical at a dilution of about 100 litres per gramme equivalent of dissolved salt. To such a monovalent ion as chlorine, then, can be assigned a definite specific ionic mobility, which at great dilution is independent of the nature of the other ion present.

The first direct experimental confirmation of Kohlrausch's theory was given by Lodge, who measured the velocity with which hydrogen ions travelled along a tube filled with a jelly solution of a salt which contained an indicator, showing the presence of acid by a change of colour. Further experiments were made by the present writer, who traced the movement of the boundary between two solutions which were themselves of different colours. When the colour difference is due to the cations the colour boundary travels with the current; when it is due to the anions it moves against the current. This method has lately been improved and extended by Orme, Masson, and Steel. The general results confirm Kohlrausch's theory; the observed velocities agree with those calculated, and a very close coincidence is found throughout a considerable range of concentration for salts of monovalent ions. For divalent salts, slight discrepancies appear at higher concentrations, indicating the existence of complex ions, in this confirming the results of other lines of research.

The result of the investigations we have described clearly establishes the convective view of electrolysis; opposite streams of ions certainly pass through the solution, with the velocities indicated by Kohlrausch's theory, carrying their electric charges with them. To allow this migration a certain freedom of movement is necessary; how this freedom is secured is another question.

There is evidence to show that the migratory freedom is not produced as an effect of the electric forces, but exists whether or not such forces act. When the reverse polarisation at the electrodes is eliminated by the use of alternating currents or otherwise, it is well known that the conduction of electricity through solutions conforms to Ohm's law. The current is directly proportional to the E.M.F., and any force, however small, will consequently produce a corresponding current. In the body of the liquid, then, there can be no appreciable reverse E.M.F.'s, and no chemical or other reversible work is done when a current passes, all such work being located at the electrodes. Thus it follows that the current does no work in giving the ions the independence required for their electrolytic functions; the part played by the E.M.F. is merely directive, and the only work expended by it goes in moving the ions, which already possess the necessary freedom, against the frictional forces of the viscous medium.

So far our argument shows that under all conditions the ions of a conducting solution possess the freedom which allows their passage through the liquid under the action of an E.M.F., but we have not considered the essential nature of this migratory freedom. Two alternatives seem to present themselves. Either the ions may migrate independently of each other, in accordance with the dissociation hypothesis, or else they may work their way through the solution by taking advantage of the successive formation and decomposition of molecular aggregates, or of collisions between the dissolved molecules, and the consequent possibility of ionic interchanges, in some such manner as is pictured in Grotthus's chain.

Let us assume for the moment the latter hypothesis, and trace the consequences. The solute molecules are scattered throughout a large volume of solvent, and, on this view, the ions work their way along from molecule to molecule of the solute, at the instants of collision between those molecules. Their velocities must therefore depend in some way on the frequency of collision, and this frequency, we learn from the kinetic theory, varies as the square of the concentration of the dissolved molecules. The ionic mobilities, then, will increase with the concentration, probably approximately as its square, while the conductivity, which, on the convective idea, is proportional to the product of the mobility, and the concentration will vary more or less proportionally to the cube of the concentration. These consequences of the hypothesis are contrary to observation, which shows that in general the ionic mobilities only vary slowly with dilution, usually slightly falling as the concentration increases, while the conductivity of a dilute

* Paper read before the Faraday Society, June 30, 1903.

Digitized by Google

solution is directly proportional to the first power of the concentration instead of to its cube, and increases more slowly than the concentration as the solution becomes stronger.

The view which refers the ionic mobilities to molecular interchanges is thus clearly untenable, and we are driven to examine further the hypothesis of ionic dissociation. Here may be emphasised the point that the dissociation indicated by the electrical properties of solutions is merely a dissociation of the ions from each other, and does not require the supposition that they are free from all chemical combination; forces would certainly exist between the ions and the solvent, and there seems no reason to assume that chemical union between them cannot occur. Molecular complexes with an ion for a nucleus may exist, definite compounds may be formed, or some kind of double decomposition result in the production of new molecules in which an ion retains its electric charge. About these various possibilities the electrical evidence has nothing to say, an effective migratory independence from each other is all that the ions need to produce the observed phenomena.

The dissociation theory, reached by the arguments outlined above, is supported, and was indeed originally suggested, by other relations. The possibility of assigning specific ionic mobilities, which are independent of the other ion present, is strong evidence for mutual ionic independence. The additive nature of the properties of electrolytes—their colours, for example—though perhaps too much stress has sometimes been laid on it, still tells the same tale. These and other similar arguments are familiar to all readers of text-books on the subject, and need not here be considered in detail. Evidence less well known is given by the power possessed by electrolytes of coagulating certain collodial solutions, such as those of the sulphides of arsenic and antimony. It has been found by Schulze, by Linder and Picton, and by Hardy, that this coagulative power stands in a remarkable relation to the valency of the reacting electrolyte, the relative effects for salts with monovalent, divalent, and trivalent ions being represented by the ratios l : 30 or 40 : 1,000 or 1,600. Such results are explicable on the view that the modification of conditions which results in coagulation is produced by the action on a colloid particle of a certain minimum electric charge. An equal charge is brought up by the conjunction of two triads, three diads, or six monads, and, by the principles of the kinetic theory, this relation leads to the values for the ratios of the coagulative powers of $l : x : x^2$. Putting x equal to 30 or 40, we get, within the limits of experimental error, an exact concordance with the observed results. This explanation has lately been supported by an experiment of Hardy, who finds that the less penetrating rays from radium, which consist of positively charged particles comparable in size with the hydrogen atom, are likewise able to induce coagulation in solutions of proteid.

Thus, taken together, the electrical properties of aqueous solutions yield an overwhelming amount of evidence in favour of the migratory independence from each other of the ions of the dissolved substances. The same conclusion has been reached by an entirely different method of research.

The theory of osmotics rests on a thermodynamic basis, from which we may approach it in two ways. We may accept the pressure-solubility relations of gases, and deduce the results by a thermodynamic cycle in a cylinder with semi-permeable diaphragms, in the original manner of van't Hoff, which has been followed by Lord Rayleigh, or we may with Willard Gibbs, von Helmholtz, and Larmor treat the subject from the fundamental ideas of the molecular theory. By the latter method we must regard the solute as distributed throughout the solvent as a number of discrete particles, each of which may effect, either by way of chemical combination or physical influence, a certain minute volume of the solvent lying round it. The nature of this influence is unknown, but, whatever it may be, as soon as the solution becomes so dilute that, except for an inappreciable fraction of the time, these spheres of influence do not in general intersect each other, any further addition of solvent will only increase the separation of these spheres of action. It cannot change the internal condition of one of them—that is, it cannot affect the interaction between the solute particles and their surrounding solvent. The change of available energy produced by the entry of solvent must then simply be that due to the dilution of the solute particles, and cannot depend on any interaction between solute and solvent. Now, the osmotic pressure which a solution will exert against a solvent is measured by the rate of change of the available energy of the system when solvent is allowed to enter the solution reversibly through a semi-permeable membrane. The osmotic pressure, then, must, from what we have said above, be independent of the nature of the solvent, and will, therefore, have the same value if no solvent be present. Thus, in cases where this is possible—that is, for volatile solutes—it follows that the osmotic pressure must be equal to the gaseous pressure corresponding to the same concentration. In this way we establish theoretically the gaseous laws for the osmotic pressure of volatile solutes, and, since volatility is probably only a matter of degree, it seems reasonable to extend this result to non-volatile bodies. Whether this extension be regarded as theoretically valid or not, there is abundant experimental evidence that it is practically justified, since the osmotic pressure of such substances as cane sugar is well known to have the gaseous value.

The direct measurement of osmotic pressure is a matter of considerable difficulty, but there exists a theoretical connection between that pressure and certain other properties of the solution, such as the lowering of its vapour pressure and the depression of its freezing point below the corresponding values for the pure solvent. Observations on the boiling or freezing points of solutions, then, enable the osmotic pressures to be calculated. As is well known, direct osmotic determinations, as well as the results of experiments on these correlated properties, yield abnormally great values in the cases of aqueous solutions of electrolytes. It was van't Hoff's investigation of this phenomenon that originally suggested the idea of ionic dissociation to Planck and Arrhenius. Since the thermodynamic theory shows that the osmotic pressure of dilute systems depends only on the number and not on the nature of the dissolved particles, or on the nature of the solvent, when the osmotic properties have abnormally great values for dilute solutions, it must follow that the number of dissolved particles is greater than that calculated from the chemical formula weight—that is, that dissociation must have occurred. It does not necessarily follow that the dissociation is that with which we have to deal when examining the electrical properties; whether it is or is not is a matter for further enquiry. Complicated molecules, dissolved in non-aqueous solvents at any rate seem sometimes to undergo dissociation into parts which are not electrical ions, for Kahlenberg has lately found that solutions of diphenylamine in methyl cyanide show abnormally low molecular weights and yet are non-conductors of electricity. On the other hand, it is difficult to see how more than one kind of dissociation is possible in such a molecule as potassium chloride, which we have already seen is dissociated into electric ions when dissolved in water.

In cases where the dissociation indicated by the osmotic pressure is found to be electrical in its nature, two separate relations have usually been held as necessary consequences of the dissociation theory. How far such suppositions are justified we will proceed to discuss.

The equivalent conductivity of a solution of a simple salt such as potassium chloride increases with dilution and finally becomes constant. There seems reason to believe that the salt is then completely dissociated into its ions, which, in this case, are shown by the chemical and electrical properties to be two in number. If the osmotic phenomena are examined at dilutions corresponding to complete electrolytic dissociation, we ought to find indications here also that the molecule of potassium chloride behaves as though it were separated into two parts—the osmotic pressure and the freezing point depression should possess double their normal values.

The only satisfactory measurements at the extreme dilutions necessary are those described by Mr. E. H. Griffiths to the British Association in 1901. The freezing

Digitized by Google

points of a solution of cane sugar, as measured by the most accurate methods of platinum thermometry, were such that the molecular depression maintained a value of 1·858 from concentrations of 0·0005 to 0·02 normal. Taking 79·4 as the best value for the latent heat of fusion of water, the result, calculated thermodynamically from the gaseous value of the osmotic pressure, is 1·857. A solution of potassium chloride gave results which increased as the concentration diminished, finally reaching a value of 3·720 at a concentration of 0·0003 grm. equivalents per litre. Twice 1·857 is 3·714, agreeing within very small limits of experimental error with the observed result.

For no other electrolytes are such accurate cryoscopic data yet available. The observations of Loomis, which are put forward by Raoult in his recent work as in themselves trustworthy and in accordance with the best of the other known results, were carried only to concentration of 0·01 normal. At this concentration were found value for various binary electrolytes which approach the theoretical result within a few per cent. Substances which, like barium chloride or sulphuric acid, are shown by their electrical behaviour to produce three ions, gave a molecular depression of freezing point some 10 per cent. below the figure for complete dissociation, while salts with two divalent ions, such as magnesium sulphate, fail to reach 3·714 by about 30 per cent. In all these cases the discrepancies are in the direction suggested by the electrical conductivities, which, especially for the last class of salts, indicate that the dissociation is very far from complete at the concentration used in the cryoscopic experiments.

On the whole, then, the evidence is clearly in favour of the relation we are examining, in those cases which have been adequately examined at sufficiently great dilutions.

It has usually been considered that the dissociation theory required a further relation between the electrical and the osmotic measurements. At higher concentrations the equivalent conductivity diminishes, and this is held to denote incomplete ionisation. The actual value of the equivalent conductivity, divided by its value at extreme dilution, is commonly taken as measuring the fractional coefficient of ionisation, which can obviously be also calculated from osmotic data on the assumption that each dissolved particle still causes the effect it would produce at infinite dilution. Many discrepancies between the values given by these two lines of research have been discovered, and it is necessary to examine how far the theory really suggests any coincidence.

The electrical value of the coefficient of dissociation assumes that no complex ions are present, and that the ionic viscosity of the solution is the same as that which the solvent offers to the passage of the ions at infinite dilution. It is probable that small errors are introduced by these assumptions, but on the other side much larger ones are possible. The deduction by the principles of thermodynamics of the gaseous value for the osmotic pressure is only valid for dilute systems—systems, that is to say, between the parts of which there are no appreciable forces. It is true for a gas at atmospheric pressure; it is true for a non-electrolyte at moderate dilution; but, as Dr. Larmor pointed out to the writer, we must not assume that inter-ionic forces will vanish at corresponding concentration.

In the light of our present knowledge it is natural to represent a non-dissociated molecule as an electrical bipolar system. The forces between the widely separated molecules of the dissolved substance will be analogous to the translational forces between two small magnets at a distance from each other large compared with the length of either of them. Such forces vary inversely as the fourth power of the distance, and therefore become insensible as soon as that distance exceeds a very small value. Inter-molecular effects, then, will vanish for the solute at moderate dilutions, and the osmotic properties conform to the gaseous laws.

On the other hand, representing an electrolyte in solution as chiefly composed of dissociated ions, we see at once that the forces between those ions are those between isolated particles, charged with opposite kinds of electricity. Such forces vary inversely as the square of the distance, and therefore remain effective at distances whereat the bipolar solute molecules have quite ceased to exert any mutual influence. Inter-ionic forces will thus produce disturbing effects even at very great dilution. The fact that the theoretical value for the freezing point has been reached in the case of potassium chloride shows that here, at any rate, they vanish at a dilution which, though very great, is still experimentally attainable. It does not follow, however, that they remain insensible as the concentration rises, and the ionisation, determined electrically, ceases to be complete.

Experiments on the comparison of the electrical and the osmotic values of the coefficient of ionisation are now seen to have little use from the point of view of the controversialist seeking arguments for or against the ionic dissociation theory. Such comparisons, however, are of interest, inasmuch as they give data which may enable a more complete theory than we yet possess to take account of the inter-ionic forces which seem to disturb the course of the phenomena except at extreme dilution. Taking as an example solutions of potassium chloride, we may compare the ionisations deduced from electrical measurements by the writer at 0deg. C. with that indicated by the combined cryoscopic experiments of Griffiths, Raoult, Loomis, and H. C. Jones. The coincidence with theory of Griffiths's result shows that the two values agree at extreme dilution, but the cryoscopic curve falls below the electrical one at concentrations of about one-hundredth normal and upwards, reaching a maximum discrepancy (0·84 compared with 0·88) at one-fifth normal, and approaching the higher curve again at greater concentrations. It is possible that the two curves, if prolonged, would cross each other at some considerable concentration. Such chance coincidences probably explain some of the agreements which have been observed between the two lines of research in moderately strong solutions of many salts. More accurate determinations of freezing points are needed before such comparisons as these can be taken as a satisfactory basis for theoretical generalisations. Collections of present data have been made by MacGregor and by Kahlenburg, and further discussion can be found in the writer's book on the "Theory of Solution."

The modern theory of the galvanic cell, based on that of the concentration cell, involves both electric and thermodynamic considerations. By imagining an isothermal and reversible cycle, carried out by the passage of one electric unit through the cell and the reversal of all the chemical and concentration changes by other means, the electric work, and thus the E.M.F., can be calculated. The original treatment of the subject, due to von Helmholtz, effected the reversal by an imagined process of evaporation and condensation of vapour, but it is now more usual to suppose that the reversal is brought about by producing the necessary changes of concentration by osmotic means. In one or other of these ways, by assuming the gaseous laws, the work done in the second part of the cycle can be calculated, and this is equal to that given out in the first part. It is evident that such a theory, based on the principles of thermodynamics alone, furnishes no evidence one way or the other about any definite electrolytic or ionic hypothesis, any more than the thermodynamic theory of osmotic pressure can enable us to decide whether that pressure is produced by chemical affinity or by the bombardment of the membrane by the dissolved molecules. In each case we may either rest content with the correlation of the subject given by thermodynamics, or we may enquire further whether any known picture of the physical nature of the phenomena will give us a satisfactory explanation.

Now, one kind of concentration cell may be regarded in a simple manner from the point of view of the dissociation theory. It is a cell in which the total potential difference is that due to the contact of two solutions of the same substance at different concentrations. Let us imagine a strong solution of hydrochloric acid placed in a vertical cylinder, and a volume of water placed above it. The dissociated ions of the acid will both diffuse upward, but the more mobile hydrogen will travel faster than the chlorine. Separation thus occurs, and the water (or dilute solution) is found to take a positive potential relatively to the strong solution. Soon, however, the electrostatic forces between the ions become so great that further

Digitized by Google

separation is impossible, and the opposite ions then diffuse at equal rates. From Kohlrausch's experiments we know the velocity with which any ion moves under the action of a given force, and from the knowledge of the osmotic pressure gradient we can calculate the forces at work. Thus the actual velocities of diffusion can be obtained and the diffusion constant deduced. It is found to agree in a remarkable manner with the observed diffusivity. Equating the velocities of the two ions we get the condition for no further separation, and obtain an expression for the difference of potential between the two solutions in the form

$$\frac{R\,T}{q}\frac{v-u}{v+u}\log\frac{c_2}{c_1},$$

where R is the gas constant for one gramme-molecule and of its electric charge, T the absolute temperature, c_1 and c_2 the concentrations, and u and v the coefficients of ionic mobility. Such an expression agrees with that deduced thermodynamically for similar cells, and Nernst, by suitable experimental arrangements, has confirmed it directly. Thus the phenomena of concentration cells may be satisfactorily explained by the hypothesis of independent ionic diffusion.

The chemical reactions of electrolytes, rapid and easily produced, are in marked contrast with those of organic bodies, which are usually attacked slowly and with difficulty. In the original presentment of the dissociation theory Arrhenius pointed out the close numerical connection which exists between the electrical ionisation of aqueous solutions and the coefficients of chemical activity of the dissolved substances.

There is no such definite theoretical deduction of this relation as of that between the conductivity and osmotic effects; the connection of electrical ionisation with chemical activity is a matter of observation, and the conclusion that in the rapid chemical actions characteristic of electrolytes it is the ions which alone are active, rests on the evidence of this connection alone. The numerical relations given by Arrhenius, and the many deductions from this hypothesis which have been verified for aqueous solutions, have led to the idea that a similar explanation of the nature of all rapid chemical action might be given, whatever the solvent and whatever the conditions. There seems, however, no valid theoretical reason which necessitates such an extension, and it is possible that in other solvents, and for gaseous or fused systems, rapid chemical change may be brought about by non-electrical double decomposition. This conclusion is supported by an observation of Kahlenberg on the instantaneous production of a precipitate of copper chloride when hydrochloric acid is passed into a non-conducting solution of copper oleate in benzene. It is evident that such a result indicates that in the particular solvent used rapid chemical action may occur which is not correlated with appreciable electrolytic ionisation, but it does not in the least affect the electrical and osmotic evidence we have adduced above in favour of the theory of the ionic dissociation of the aqueous solutions of electrolytes. Nevertheless, it serves to caution us against extending the deductions of theory which apply to simple aqueous solutions to cases which have not been subjected to an adequate theoretical and experimental examination.

The recognition of the intimate connection between chemical and electrical phenomena led Ostwald to apply the mass law of chemical action to the effect of dilution on the equilibrium between the undissociated molecules and the ions formed from them in an electrolytic solution. As is well known, this application met with perfect success in the case of weak acids and other slightly conducting solutions, but completely failed to explain the effects of dilution on strong acids and other good conductors. This discrepancy has been considered one of the greatest objections to the dissociation theory. The difficulty, which formerly appeared to the writer a very great one, is probably to be explained by that difference in the law of the variation of the force with the distance which we have already pointed out must exist between solutions containing non-dissociated bipolar molecules, and those containing dissociated electrified ions. The inter-molecular forces, varying inversely as the fourth power of the distance, rapidly become insensible with dilution, while those between the ions, depending on the square of the distance, are effective at much higher concentrations. Now, the theory of the mass law rests on a thermodynamic basis, and in its deduction the assumption is made that the matter considered is in the dilute state. The work done in forming a small quantity of one of the products of the reaction at a standard pressure, and bringing it to the existing pressure, may then be written in the form $a + R\,T \log b\,c$, where a and b are constants, R the gas constant for one gramme-molecule, T the absolute temperature, and C the concentration. Similar expressions give the work done for other reagents or products, reckoned positive when they are formed and negative when they disappear. When equilibrium is reached, the change of available energy arising from a further slight transformation must vanish; thus the value of $n_1 (a_1 + R\,T \log b_1 c_1) + n_2 (a_2 + R\,T \log b_2 c_2) + \ldots$ must be zero, and we see that $C_1^{n1} C_2^{n2} \ldots$ may be put equal to K, a function of the temperature alone. This result is the mass law, and if we apply it to a solution in which one gramme-molecule of electrolyte is dissolved in a volume, V, a faction, α, being ionised, we obtain the equation

$$\left(\frac{1-\alpha}{V}\right)^{-1}\left(\frac{\alpha}{V}\right)^{2} = \frac{\alpha^2}{V(1-\alpha)} = K,$$

Ostwald's dilution law. Its deduction clearly involves the assumption that the gas laws hold good, and that consequently no inter-molecular forces or other similar actions are appreciable. We must not, therefore, look for conformity with the dilution law in solutions where many dissociated ions are present.

Summing up our enquiry as far as we have yet pursued it, we may say that the phenomena of electrolysis and the osmotic properties of electrolytes clearly indicate that the conduction of a current through an aqueous solution consists in the convection of charged ions through the liquid, the ions being dissociated from each other while they are electrolytically active.

We must now raise the much wider question, and ask whether this mode of conduction is a universal accompaniment of electrolysis, or whether it is confined to the case of solutions in water. Since the development of the dissociation hypothesis as applied to liquid electrolytes a vast increase has occurred in our knowledge of the discharge of electricity through gases. This process has been satisfactorily explained as a convective electrolytic action, the ions being in some cases dissociated molecules, in other cases isolated corpuscles, which may represent the ultimate units of negative electricity, perhaps even the common constituents, aggregates of which make up the different chemical atoms. Such results not only support the idea of a similar dissociation as the cause of the conductivity of solutions, but give a presumption in favour of the general applicability of such theories. When, however, we examine how far such a presumption is justified, further considerations are seen to be involved. Had the phenomena of gaseous conduction been first in the field, we could not, without experimental evidence, have extended a dissociation hypothesis, framed to explain them, to the much more complicated systems which are formed by electrolytic solutions. It is only on the knowledge summarised in the laws of Faraday, Ohm, and Kohlrausch that the particular phenomena which have led us to the dissociation theory require such an explanation, and at present it is only for solutions in water and a few other liquids that we possess sufficient evidence for those laws, and for the other relations to which we have referred, to enable us to draw valid conclusions. Without definite experimental evidence in each case we cannot legitimately extend these conclusions, and when, as in fused salts, the conditions are entirely different, we shall presently see that an alternative explanation is possible. Nevertheless, for all *solutions* which conduct electricity, the presumption in favour of similarity of explanation is very great, and for several solvents, at any rate, experiments show that the general process of conduction is similar to that which we have studied in aqueous solutions.

When we go further, however, and try to trace in non-aqueous media the ionisation of solutes as measured electrically and osmotically, we are met by want of numerical data, largely owing to increased difficulty of experiment. With some solvents—as, for instance, the alcohols—freezing-

Digitized by Google

point work is impossible, and in no case do measurements of osmotic properties appear to have been made at dilutions great enough to enable us to fairly treat the systems as thermodynamically dilute. On the electrical side some data are available, but the examples of acetic acid and ammonia show that, even in water solutions, complete ionisation cannot always be experimentally attained, and, without definite evidence, it is not safe to conclude that in another solvent it can ever be reached. We have already seen that only when the dissociation is complete can a just comparison be made between the numbers of ions given by a molecule as determined electrically and as determined osmotically. Thus it is necessary to push the dilution so far that the equivalent conductivity reaches a definite limiting value before making such comparisons. Limiting values have been obtained for salts of the alkali metals dissolved in methyl and ethyl alcohols, in acetone, and in pyridine, but in all these cases no osmotic data have been determined at dilutions great enough to secure complete ionisation or to justify the gaseous laws as applied to the osmotic phenomena. Experiments at higher concentrations are of little value, for not only do the disturbing causes already noted in the case of aqueous solutions act here also, but it is known that one of them, the influence of complex ions, is much more common and much more important. It is probable, too, that association of the non-ionied solute molecules may occur, Kahlenburg, for instance, having discovered cases in which the boiling or freezing points of conduction solutions indicate that the number of such molecules is less than the chemical formula would lead one to expect. It is evident that the existence of such association does not in the least prevent the conduction of the current by the movement of charged ions dissociated from each other. Such observations as those referred to have been brought forward as evidence against the whole basis of the theory of ionic dissociation, but the relations on which they bear are, as we have seen, merely consequences of the theory under ideal conditions of very restricted nature, and are not, as seems to be commonly supposed, the very foundation on which the theory rests.

Faraday found that many fused salts were electrolytes, with conductivities of the same order as those of aqueous solutions, and since his time it has been confirmed that in such cases the electro-chemical equivalents have the usual values. How far are the principles of the dissociation theory applicable to fused electrolytes? No osmotic data are available, and it is difficult to see how such data could be obtained. Let us examine the matter from the electrical side. The products of decomposition appear at the electrodes only, and Faraday's laws hold good; hence the process must be convective, but we have no knowledge of the ionic velocities, and no means of estimating the amount of ionisation. When closely scrutinised, the conditions are seen to be essentially different from those which led to the adoption of the belief in considerable and permanent dissociation for aqueous solutions. We do not know that the conductivity is proportional to the number of ions present, but even if such a relation were established, the consequences deduced from it in the case of solutions would not necessarily follow. The process, as we said, must be convective, and freedom of migration of the ions is necessary, but, unlike a solution, a fused salt consists of a collection of molecules all of the same kind, and the argument from the frequency of collision between dissolved molecules, isolated from each other by comparatively vast spaces of solvent, ceases to be valid. In a fused salt the electrolytic molecules are crowded together, and, even if dissociated ions are present, the interaction of one of them with one of the surrounding electrolytic molecules, which replace the neutral molecules of the solvent of a solution, would make possible an effective interchange, and enable an electric transfer to take place Thus the frequency of interchange for any one ion would not increase with the ionic concentration as in the case of a solution, and the conductivity might be proportional to the number of ions without permanent ionic dissociation. The conditions are entirely different to those which hold in a solution, where the solvent molecules are of different kind to those of the electrolyte, and cannot take a direct part in the electrolytic process. We may now go further, and say that it is possible that conduction in a fused salt may be due to a mere possibility of interchange between the electrified parts of the molecules, without any permanent and definite dissociation. Some process in the nature of Grotthus's chain may, in this case, secure the migratory freedom necessary for electrolytic conduction. Whether this is so, or whether, as in solutions, the current is carried by ions dissociated from each other, their number being a function of the temperature, remains a question for future investigation.

TRANSMISSION AND DISTRIBUTION BY SINGLE-PHASE ALTERNATING CURRENT.*

BY E. W. MONKHOUSE, M.A., M.I.C.E.

The question of electrification of railways has been, and is, receiving much attention and consideration from the directors of railways and their advisers, and the question of cheap power is receiving the attention of numerous other people. The problems which have to be solved are: the cheap generation of electrical energy; the transmission thereof; and the utilisation thereof at the end of or along the line. The necessity for transmission of power over long distances arises from the fact that it is often inconvenient or inadvisable, from the point of view of economical generation of energy, to have generating stations near the points at which energy is being used. If the distance is great, it is not possible to transmit at low pressures, as, if this were done, the amount of copper which it would be necessary to use in the transmission line would be prohibitive. Where it is not necessary, owing to circumstances, to generate and transmit at more than about 1,500 volts, the electrical energy can be generated by continuous-current machines, but above this pressure continuous-current machines give trouble, and it becomes necessary to employ machines which generate alternating current.

It is a well-known fact that for use in lamps there is nothing to choose between continuous and alternating current provided the frequency of the latter is high enough, so that the question is narrowed down to one of transmission and use in motors. The transmission of electrical energy over long distances for power purposes is being successfully accomplished at the present time by means of alternating currents, but these are usually polyphase. The alternating current so transmitted is generally converted into continuous current either by means of polyphase motors driving continuous-current dynamos, or by means of rotary converters, before it is used by the consumer. The numerous conversions which the original source of power has to go through in such a case all serve to lower the efficiency of the system, and it is, therefore, very desirable that the number of conversions should be cut down to a minimum. This means that we must, as long as we are compelled to use alternating current for transmission, have motors which are capable of working satisfactorily with it, and motors which will work with current at as high a voltage as possible, so that transformers are not necessary, and the copper in the transmission lines may be kept down to a minimum. An ideal system would be one in which there were no transformations of voltage between the dynamo and the motor. This means that, for very long-distance transmission, both dynamos and motors would have to be wound for very high voltages.

The generation of electrical energy at high voltage (10,000), and the transmission at the same voltage, is being effectively carried out by the London Electric Supply Corporation; and that it is possible to use high voltage in motors is shown by the fact that in 1899 a stationary motor working at 10,000 volts was in use at the General Electric Company's works at Schenectady, U.S.A., driving the machinery of a portion of the shops, and appeared to be running satisfactorily; and also that lately the Valtellina Railway in Italy has been constructed, and on this the voltage at the motors is 3,000.

* Paper read before the Engineering Conference of the Institution of Civil Engineers.

Digitized by Google

The raising of the voltage of transmission and the voltage at the motors points to the necessity for having all connections and apparatus as simple as possible; and the use of single-phase alternating currents in place of polyphase would tend to this end, as all switches, instruments, etc., are reduced to a minimum. On a single-phase alternating system the switchboards at the generating and sub-stations are much simpler and less costly pieces of apparatus than on polyphase systems, for only single-pole switches and fuses are required in place of triple-pole; the instruments are much fewer, and the connections are of the simplest character. The transformers also are simpler. It follows, as a matter of course, that the cost of up-keep is much less, and also that the chances of breakdown owing to failure of apparatus are considerably reduced.

The desirability of employing a single-phase system rather than polyphase for transmission of energy from the generating station to the sub-stations is therefore apparent, but this is greatly emphasised when the question of the line from which current for traction purposes has to be collected is considered. All writers on the subject of electrical working of long distance heavy railways are agreed that, owing to the fact that the line voltage could only be comparatively low if continuous currents were used, the conductors for carrying the large currents necessary for working the trains would be of a prohibitive size, unless sub-stations for feeding current into them were placed at very short intervals along the line, and this, of course, would involve not only a large capital outlay, but also a large staff of men, and consequently heavy running expenses, and also that the collection of such large currents would be a matter of great difficulty, and that, therefore, the currents used must be high-tension alternating. This being the case, we have the choice of using single-phase or polyphase currents, and it will be at once apparent that on the score of simplicity the single-phase current is the much more desirable; for, assuming that the rails are used as one conductor, as is the case on the Valtellina Railway, it is only necessary to have one conductor in addition to these, and consequently one collecting device, instead of two conductors and two collecting devices, as is necessary with a polyphase system. Having only one conductor makes junction work extremely simple, whereas with two conductors this is extremely complicated; and as, for reasons already given, high voltages are necessary, complications are to be avoided. Moreover, the whole of the collecting and controlling gear is much simpler.

The difficulties hitherto experienced in starting alternating-current motors under load, and in getting such motors to deal satisfactorily with great and sudden changes of load, would appear to be the principal reasons for adopting polyphase alternating currents for motor work as against single-phase. The single-phase motor of the present day, however, can be started under load, and will deal satisfactorily with very sudden and great variations in the load.

The question of speed regulation is one which affects polyphase and single-phase motors alike, and in a paper read before the institution Messrs. Mordey and Jenkin gave descriptions of methods that had been proposed for dealing with this. All the methods proposed involved the use of some sort of rotary transformer for transforming alternating current into continuous current, and then using it in the motors, and this involved the provision of sub-stations by the side of the line, or the carrying of much machinery besides the motors on each train.

Mr. Lamme, in a paper read before the American Institution of Electrical Engineers, gives a description of the Washington, Baltimore, and Annapolis Railway, which is to be a single-phase overhead alternating-current system, in which the motors are to be worked by the single-phase alternating current at 3,000 volts. The speed control is to be effected by an induction regulator, thus avoiding the use of resistances which absorb power.

The advantages of transmission of power by single-phase alternating current are so apparent that it only remains for a suitable motor to be produced which will give as good results both as to regulation and efficiency as are given by the best continuous current motors, to ensure the system being used for long-distance power transmission in the future.

DISCUSSION.

The **Chairman** said the subject dealt with by Mr. Monkhouse was extremely interesting and important. The author had said that it remained only for a suitable motor to be produced which would give as good results both as to regulation and efficiency as were given by the best continuous-current motors. That was really the difficulty, and that was why the single-phase motor had not been pushed from the beginning, and anybody who could give them any information as to how the difficulty could be overcome would confer a great favour on the electrical world. The thing, of course, was that the single-phase alternating current was difficult to start. They wanted starting devices to get it into synchronism with the generator, and that did away again with the simplicity of the system which Mr. Monkhouse had spoken of. Once the thing was running it done all that could possibly be desired. But before it could be got to run complications and starting devices had to be introduced, which did away with all the advantages it possessed beforehand. There was no doubt that single-phase motors were nowadays better than they used to be; still, their use was restricted.

Mr. H. R. J. Burstall said the London Electric Supply Company had been taking a good deal of pains lately to obtain single-phase motors, and they had had at Deptford for the last few months a single-phase motor on trial. They had tried throwing a load on and off, and they had also switched off the main current for quite an appreciable time, the switch being broken for half a second. It picked up and ran perfectly well. One firm he knew of had been doing their utmost to use the single-phase motors, and he thought with success He thoroughly agreed with Mr. Monkhouse about the question of the simplicity of the single-phase alternating current compared with the polyphase. When one compared the extremely simple switch gearing which could be used with the single phase with the necessarily complicated polyphase switch gearing, the cost was very much less, and the gearing could be so arranged as to be perfectly safe in every way. The author had confined his remarks mostly to the question of railways, that being one of the most important questions at the present time. But a great deal of work had been done during the last year or two in the way of adapting the single-phase current for ordinary work, and his own opinion was that within the next few years they would see a great deal more work done in that direction if makers would only take a little trouble to see what could be done with the single-phase motor instead of running after what was more or less the fashion now—the polyphase alternating machine.

Mr. A. H. Preece knew a large factory where they had some single-phase motors varying in size, and they had absolutely no trouble or bother. He had recently installed, for condensing purposes, two motor circulating pumps for lifting water from the Thames into a station which was about 300 yards off the river. So far as he recollected, the horse-power of them was about 30 h.p. to 35 h.p. They gave absolutely no trouble, starting and stopping as required, and did not affect in any way the public supply. He knew of two theatres where the system of continuous current was adopted. One had a 25-kw. motor-generator which had a single-phase motor, and that, again, worked perfectly. He thought it only required a little more push and go on the part of the single-phase makers to create a very large business in London.

Dr. Hopkinson doubted really whether the advantages were quite so apparent as Mr. Monkhouse suggested in his paper. He mentioned that there was, of course, an obvious advantage in having two conductors instead of three. That, probably, was the only advantage that could be put forward, and against that, of course, there was a larger amount of copper required for single-phase distribution than there was for the three-phase distribution. He quite agreed with what had been said as to the satisfactory running of a single-phase motor. That fact had been well established in many cases, but he did think that the use of a larger amcunt of copper was a serious disadvantage.

Mr. Broadbent said there was no doubt that the alternating current was coming to the front, and that the continuous current would take a back place in the future. Mr. Monkhouse had referred to the Valtellina Railway, but the motors used on that railway were not alternating-current motors of the kind one was accustomed to think of. Reference had been made in the paper to the speed control being affected by the conductor regulator. One would like to know a little more about that method of regulation.

Mr. Monkhouse having replied, a vote of thanks was passed.

ROBERTSON ELECTRIC LAMP WORKS.

Last Friday the directors of the General Electric Company, Limited, and of the Incandescent Electric Lamp Company, Limited, entertained a large company of ladies and gentlemen on the occasion of the opening of the extension to the "Robertson" Electric Lamp Works. Personally, we found ourselves and another child or two who take notes taken care of at Blackfriars Bridge, installed in a comfortable 22-h.p' motorcar, supplied with a regalia—not a "dos amicos ranchtsi fueros mueros," but a brand almost too good for outside consumption—and whisked along the Embankment in defiance of time-taking "Roberts." Arrived at the Robertson Works in Hammersmith, we found a very large gathering of

Digitized by Google

ladies and gentlemen, arrayed in all their Ascot finery, listening to an excellent programme by the Blue Hungarian Band and discussing ice creams, which once in a way proved seasonable even in London's midsummer.

Mr. C. Wilson, the general manager of the works, then led the way through the old works and through the extensions, which together make a handsome pile of formidable dimensions. We are informed that 10 miles of flooring was used within the building. The inspection commenced with the "stinks" department, where the magic process of converting solid cotton-wool successively into liquid, solid, thick, soft, thin, hard, and pliable matter, evinced great interest. Up and down stairs we went then for miles, seeing 550 men and girls busy glassblowing, adjusting, testing, and packing lamps without number. The annual output of the works figures over 3,000,000 lamps, and there were the busy bees absorbed in all manner of delicate operations, some spinning at threads 1/2500in. in thickness. We never saw such a lot of girls together keeping so quiet in all our lives. A new process, special to Robertson's, by means of which the old and wearisome process of closing up the terminals with plaster of Paris is superseded by the application of a quickly-setting solution, seemed specially interesting and valuable. Instead of having to wait for two days, the lamps are ready sealed up in almost as many minutes. After descending an unusually wide outer staircase made of iron steps of an easy grade, and which reaches from top to bottom, we regained the spacious hall aforementioned. Here a most perfect system was laid on for charging the cells of inner man and woman, the latter especially being charmed with an endless variety of delicious confectionery.

Mr. WILSON, in introducing the Mayor of Hammersmith, Mr. Alton Phillips, read a telegram from Mr. Hirst, the managing director of the General Electric Company, whose unavoidable absence through illness was much regretted.

It being the King's birthday, the MAYOR asked the company to sing "God Save the King," which was done most enthusiastically. The Mayor then referred to the company, stating that they were the largest consumers of the Corporation's current, spend a large amount in wages in the district, while the Corporation were their customers for the excellent lamps made at the works. He proposed "Success to the Company," which was drunk in bumpers of champagne, which suddenly sprung up from nobody knew where.

Sir RICHARD HAWTRY then proposed a vote of thanks to the Mayor, and the builder, Mr. T. CHAMBERLAIN, gave some details of the building.

Mr. G. BYNG, chairman of the General Electric Company, was next sung a "Jolly Good Fellow," and his speech was taken as read. It reads as follows: "I look upon this large attendance of ladies and gentlemen as an encouragement to British industries. There are a good many old friends amongst you who have known me and the scope of our enterprises for a great many years, but there are a great many also to whom some introduction of myself and our undertakings would at the present moment be appropriate, and, at the outset, I wish to ask your kind indulgence, if, throughout my speech, I refer a great deal to myself. Those who know me will readily understand that this is not done from any selfish motives, but mainly to draw from my own experience such lessons as cannot be found if I were to confine myself to generalities. We manufacture almost every kind of electrical apparatus and machinery. At Birmingham we have our large works for dynamo, motor, carbon, steel tubing, and electric light fitting. At Manchester we have our works for telephone, telegraph, bell, arc lamp, switchboard, and electric light accessories. In the aggregate these works form the largest electrical undertaking in the country, and I, who am at the head of this enterprise, employ now more than 5,000 workpeople. The following is a short history of the "Robertson" Electric Lamp Works: The late Mr. Fraser, our technical manager, Mr. Robertson, and myself, were the founders in 1893—10 years ago. The success of the works was slow at the beginning, but later on extension after extension became necessary, and the larger the works became the better and cheaper could we produce our lamps. We commenced in the old building which you see here; then we bought the adjoining land, covering about an acre and a half; subsequently we built the fireproof building, then extension No. 1, and now the present extension No. 2. We started here practically a new industry, and we ourselves taught the workpeople you see here, and not only those we now employ, but many more who have drifted elsewhere. On the head of introducing a new industry into the country we may claim public credit. It is well known that on the system of free competition under which we have to work the starting of a new industry is almost an impossibility. If we are an exception, the reason lies mainly in the fact that we have two good men as managers—Mr. Robertson and Mr. Wilson—who have produced an electric lamp far superior to the lamps made by our foreign competitors. This has enabled us to obtain the goodwill and support of the British and Colonial electrical trade, amongst whom the "Robertson" lamp has become a household word, and the demand for the "Robertson" lamp has thereby not only increased, but we have been able to obtain a price not based upon competition alone, but on the merit of the article itself. I do not mind confessing that it fills me with pride to stand in this position to-day, that of the founder of an enterprise, not only successful, but one that has done good to the country at large; but, proud as I am of this achievement, yet another feeling than pride fills me to-day, and this feeling is one of anxiety. I feel anxious for the safety of the child that I have reared. To-morrow, circumstances may arise over which I have not the slightest control, which may pull down this whole edifice, and bring the work and worry of years to nought. Do you think that it is a comfortable position to be in? Now, in order to explain this, I come to the subject which is uppermost in the minds of most of us at the present moment. I refer to the question of preferential tariffs which has been raised by Mr. Chamberlain. The matter is one which concerns manufacturers vitally, and upon which those who are employers of labour should be consulted, as they are the best able to speak from actual daily experience. Would you plant a valuable tree in an exposed position, where it can grow only in fair weather, but would perish by any wind that may come along? No, you would not. Look at this factory; as I have said, it is successful in fair weather; to-morrow it may be attacked, and in a year or two you may see it empty and deserted. I will explain. I have told you that we have been successful because we can make better goods than our foreign competitors. But there is another reason. Manufacturers of incandescent lamps on the Continent have up till now quarelled amongst themselves, and their power of competition in this country has been somewhat restricted, but they are beginning to combine. I can show you documentary evidence that a movement is on foot to combine all the German, Austrian, and Dutch electric lamp factories, and what is their main object? It is first and foremost to kill the British industry of lamp-making and to capture the English market and that of our Colonies. And how will they do it? Not by any special invention or other meritorious achievement—no, first of all they will increase their price in their home market, thus becoming more powerful financially. This will mean increased output, and this open and undefended market is the place to get rid of that output. I say this may happen in a few years' time—it may happen actually to-morrow. I am entirely powerless, helpless. The success of my enterprise, the investment of hundreds of thousands of pounds, the wages of my employés, the bread of my workmen depends, upon the action and is at the mercy of the foreign manufacturers. This is a dangerous position, one that cries for immediate relief. It is the duty of the State to provide policemen against burglars—it is the duty of the State to safeguard our industries against foreign attacks. We are in the midst of a fierce commercial war, and we are unarmed against the weapons of the whole world. This is how our present fiscal policy affects the master. How does it influence his workmen and their wages? Here, again, I, an employer of labour, am entitled to be heard throughout the country. I hold that you should listen rather to the experience of a man who pays in wages alone over £6,000 per week than rely upon the opinions of men who never pay wages but to their butler, coachman, or cook. Four principal factors determine the rates of wages of manufacturing workpeople. Firstly, skill; secondly, competition; thirdly, profits of the master; fourthly, combination. With regard to the skill of a workman, in the factory wherein you are at present, the rates of wages vary from 8s. to £3. 10s. per week. A girl who wraps up the parcels and is unskilled is paid 8s., but if she acquires the knowledge of glassblowing or air exhausting she can command wages from two to four times as high. The same applies to the men; the ratio of their wages ranges in accordance with their skill. Who teaches the workmen? The master. What gives them the chance of becoming skilful? The enterprise of the master. But I say emphatically the system obtaining at present in our country, the uncertainty as to the security of capital invested, and the want of the home market wherein to sell, makes it impossible for the master to be enterprising. I look forward with much concern to the future. If this system continues but a few years longer, the skill of an ordinary workmen, as well as the inventive capacity of a higher-class workman, will be of necessity of a much lower standard than the skill of workpeople of other nations, and of necessity, too, it will tend to reduce their wages. As to competition, take facts as occurring in this very factory. Here are those workpeople—glassblowers. Look into their wages book. Two years ago their earnings averaged £3 a week. To-day they earn about 45s. a week. Six months ago our manager, Mr. Wilson, had to tell these men, "You have earned these high wages because we did not feel foreign competition. It is getting more formidable. We cannot sell at the old prices owing to foreign competition. You must either consent to have your wages reduced or go." The English workman is exposed to the competition of the labour market of the whole world and he cannot retaliate. Owing to circumstances which I could explain, he has not felt as yet the full force of this competition. I

Digitized by Google

hope he never will—the result would startle even Sir Henry Campbell-Bannerman. The profits of the master are obvious. If the master earns good profits, he can pay good wages; if the profits are small, wages must go down. If there are no profits, there will be no wages. Those politicians who affirm that the workman pays no share of the income tax (or direct taxation) may usefully ponder over this (apparently) schoolboy political economy. With respect to combination, I am a believer in the usefulness of trade unions. I look upon them as a safety valve. We masters are human, and not perfect. Trade unions keep us in order. But trade unions are powerless against foreign competition. This is so obvious that I cannot understand at all the present attitude of those at the head of trade unions; they ought to be the first and foremost in the country to cry out to relieve them of that competition over which they at present have not the slightest control. All these four factors are influenced by free trade, and in each one of them the outcome must ultimately be reduced wages. Give our workmen that protection which every other workman on the face of the globe possesses, and his wages must go up. Mr. Chamberlain is right, and I emphatically endorse his contention. Do away with the self-inflicted incubus of one-sided free trade and wages will rise. I say more: give me and my workmen our legitimate share in our home and Colonial markets, then not only will wages rise, but at the same time cost of production will go down. This statement of mine may sound a paradox to many who are anxious to continue the policy of doing nothing, but again I must claim to know more about what determines cost of production than people who never have produced sixpennyworth in their lives. I know well that many other considerations have to be reckoned with in this great question, but everyone of them, without exception, must be secondary to this consideration: Will it harm or will it benefit the power of production of our people. In conclusion, may I be so bold as to warn you against the assertions of men who have no practical experience. I am certain that you will not find the true solution of what our country wants at this present critical juncture in the Blue-books of the House of Commons or in the musty volumes of Adam Smith, Stuart Mill, or Ricardo—not even in the speeches of Cobden and Bright. No; the truth you will find here, only here, among the engineers who work our machinery, among the chemists that ponder in our laboratories, among the clerks that reckon out the cost of production in our counting-houses."

Afterwards a fire was started in the yard, a man at once made a frantic rush at an alarm to let the people inside know, and in a twinkling all the hands had come out to look at it. Some were in such a hurry that they would not wait, and had to be carried down pick-a-back by the firemen. The company's brigade of firemen rapidly laid a hoseway and had the fire out in no time. Joking apart, the display was very creditable, indeed, and showed two things—first, that the building can be emptied almost instantly, and second, that the men are well trained for an emergency which we trust will not arise.

LONDON TRAFFIC ENQUIRY.

Mr. E. Harper, statistical officer of the London County Council, was the witness before the Royal Commission on London Locomotion at their sitting last Friday. The verbal information he had to offer was supplemented by a huge mass of figures dealing with the growth of population in Greater London in the nineteenth century, overcrowding, passenger traffic in London, omnibus routes and services, railways in London, overcrowded trains, etc., all of which will, no doubt, prove of the greatest value to the Commissioners in their deliberations, but are lacking somewhat in interest to those outside the Commission. The figures he gave as to the growth of the population, etc., were directed to show that the tendency for business men to reside outside the City was swelling, and that while the increase in the day population of the City was ever growing, the night population was decreasing rapidly, thus indicating the need for improved railway facilities. He also showed that 1½ million of males over 10 years of age in Greater London were engaged in labour, and were entitled to have transport facilities provided for them. The witness touched on the importance of opening up further districts to the working-class population by means of cheap transit. It was necessary to offer some inducement to workmen to live further out, and he showed that rents in the central area did not represent the true commercial standard, and the differences between the rest of the county were insufficient to cover a workman's travelling expenses and the extra cost of meals. Dealing with decentralisation as a means of relieving the present congestion, he pointed out that local centres of business consisted mainly of shops, and the large operations of commerce must continue to be transacted in the central area. Some relief, especially to the working-class population, might be obtained by the transfer of manufactories to the country.

The Chairman: Would you be prepared to go so far as to say that workmen should be carried backward and forward by locomotion without any profit?—I would be prepared to go at least as far as that, because I have the precedent of Parliament, which has gone so far as to grant a remission of a certain portion of the passenger duty to railway companies, and part of a sort of parliamentary bargain that they should run these cheap trains which might not pay.

Mr. Gibb: Why do you suggest that the reduction should come off the carriage and not off the rent?—I should be equally pleased to see it come off both. I am not prepared to say definitely that the loss should fall on the back of the railways or on any particular back, but the interest of the community as a whole will render it imperative that cheap means of transit should be provided.

If so, why should not the community as a whole pay for it?—Clearly that should be so, and the principle to some extent is embodied in the Cheap Trains Act. The maximum workman's fare should be 2d. for 20 miles.

In answer to further questions, the witness said he did not look upon the transfer of factories to the country as any real solution of the traffic problem. The witness was next examined as to locomotion in connection with railways, describing the methods and results of the railway companies in London and Greater London, referring, among other things, to the questions of fares and season tickets, mileage, and speed, and submitting a table showing the approximate speeds per hour on the "Tube" and other underground railways.

The Commission adjourned.

DISTRICT RAILWAY.

OPENING OF THE LINE TO SOUTH HARROW.

A small section of the electric line of the District Railway—from Ealing Common to Park Royal—was opened on Tuesday, the 23rd ult., on the occasion of the Royal Show. It had been intended to open at that time the whole of the new line, a distance of over six miles, from Mill Hill Park to South Harrow. A landslip caused by the recent heavy rains, however, prevented this, and the opening was then postponed for a fortnight. The very fine weather which set in during show week and the work rendered possible by it enabled the company to anticipate this date by a full week, and the line was opened without singsong last Sunday for passenger and parcel traffic along the whole distance. In the morning and evening half-hourly trains are run, and there is an hourly service during the day. The fares are cheap; 1s. 1d. is charged for a third-class return from South Harrow to any part of the City, and there are cheap season tickets. Second-class ticket-holders travel first on the electric line, where only first and third class carriages are provided. These are of the corridor type, airy and comfortable, and similar to those in use on the Central London Railway. The gauge is the ordinary 4ft. 8½in. There are two contact rails, a positive on the side and a negative in the centre of the track. The trains are intended to be composed of seven carriages each, the cars at each end and that in the middle carrying motors. On this short line there are only four-car trains used, the cars at each end carrying each two 175-h.p. geared motors. Accommodation for parcels is made on these cars. The temporary generating station is situated at Alperton, on the Grand Junction Canal, and the plant there installed is identical with that which was used at Earl's Court for the experiments between that station and High-street, Kensington, two years ago.

The principal generating station at Chelsea is making progress, 450 men being employed there at present, and it is expected that within three months this number will exceed 1,000. The new line runs through a beautiful and rising district, beginning at Mill Hill Park and proceeding thence, *via* Ealing Common, North Ealing, Park Royal, Perivale-Alperton, Sudbury Town, Sudbury Hill, to South Harrow. It was built for experimental purposes, and during the last two months a large number of tests have been carried out in order to arrive at a basis for the principal lines as far as current consumption and heating of motors are concerned. In one day as many as 165 miles were run, with a stoppage of 22 seconds at every 2,500ft., and the valuable data thus obtained will be utilised in the general scheme. We are indebted to Mr. J. R Chapman, the engineer, and Mr. Soar, the traffic manager, for the above details, the latter laying particular stress on the fact that this new line gives now a direct connection between the South and North of London by means of the junctions at Victoria, Charing Cross, Brompton, Ealing, Moorgate-street, etc.

SOUTHPORT CORPORATION TRAMWAYS.

The accounts of the tramways undertaking for the year ended March 31 last shows that the total capital expenditure on that date amounted to £116,888, or, as reduced by sinking fund, £110,612. The traffic revenue was £16,179; total revenue, £16,387; working expenses, £11,231; interest on capital, £3,493; sinking fund, £2,884; net balance profit, £1,222; car miles run, 418,324; passengers carried, 3,535,434; percentage of working expenses to receipts, 67 per cent.; average revenue per car mile, 9·401d.; and average working expenses per car mile, 6·44d. In his report on the year's working, Mr. T. J. Kendrew, the tramways manager, says the whole of the lines, cars, and electrical equipments have been kept in first-class condition, and a deal of extra work has had to be gone through at the depôt, as the department have repainted nine double-decked cars, revarnished 11 cars, rewheeled 16 cars, and overhauled 20 cars. Ten of the double-decked cars have been fitted with the British Electric Car Company's patent destination boxes, which contain 12 names of destination, and have been found very useful in cases where it was required to transfer a car from one section to another. Twelve cars have been equipped with Angier's patent brake adjuster, which is proving very satisfactory. There has been only one case of a wire falling in the street, and this was due to a splicing ear breaking, and on no occasion have any of the trolley wires broken. The list of delays due to breakdown of the overhead equipment is very small, owing to the careful examination which has been regularly carried out.

TO CORRESPONDENTS.

All Rights Reserved. *Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.*

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Bound Volumes of "THE ELECTRICAL ENGINEER," *containing half-year's copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, July to December, 1902, now ready.*

THE FARADAY SOCIETY.

Time brings about many changes and knowledge increases so that the study of a branch of a subject now occupies a lifetime, when a century ago what was known of the whole subject could be mastered in a short time. For some years too little attention has been paid by learned societies to that branch of physics yclept electro-chemistry, not because they did not appreciate its importance, but because they had not room for it. Thanks to the activity of a few energetic spirits during the past winter, a new society has been inaugurated to deal specially with electro-chemical questions. It has aptly been called the Faraday Society, because Faraday found empiricism and left exactitude. On Tuesday last a first meeting, well attended, was held at the Chemical Society's rooms. Midsummer is not a usual time for such meetings, but probably a desire was felt to get into harness, and to show the kind of work it was proposed the society should do. The council are wise in their generation, for success depends upon the amount of patronage, and too many people are inclined to wait before joining a new society. *Bis dat qui cito dat* is as true now as when first uttered, and every member joining in the earlier months is more valuable than ten of those who join when success is assured. The only question to be asked in this case was if such a society was required, and there could be but one answer—an emphatic yes! The opinion was generally favourable, and the promoters of the new society found many friends who possessed knowledge, energy, and ability, hence have been able to inaugurate the work of the society with a series of papers which set a high standard to the proceedings. There were no less than four papers prepared for the meeting, but in future, if real discussion is to be evoked, this number will no doubt be reduced. It is impossible to adequately discuss four papers on different topics in one evening. We have been told *ad nauseam* that this country lags in the race intellectually, commercially, and technically, but on the whole the statements to this effect have little foundation in fact, emanating as they do from sources where talent is at a discount, and the prizes go to the free and forcible writers It is interesting to find even in chemical research, where we are said to be woefully behind other nations, that the current number of the Chemical Society's *Journal* contains some eighteen original communications, filling over two hundred and twenty-five pages of the *Journal*, with about two hundred and fifty pages of abstracts, so that if our chemists do not know what is going on in the world from month to month, it is not the fault of the society. The new society will not be so purely academic as the parent, but will have a leaning towards the practical, and will, indeed, be truly scientific. We in this agree with Mr. Swinburne, who said: "All engineering — electrical, chemical, or otherwise—is purely a question of cost; there are many people who think that science is not science unless it is merely useless information," rather than with a well-known professor and experimentalist, who once told us that the scientific man, the investigator, should be content with the accumulating of facts, being certain that sooner or later the practical head would come along and use those facts. We prefer the man who has a definite object in view, and this object the utilisation of results for the use of mankind. Use depends upon cost, hence cost is an important item in the investigation. One other point. The formation of a new society is the formation of a new educational centre, and while the public mind is so oblivious to facts and to the truth as to accept such a dictum as that uttered by Mr. Asquith on Wednesday, and by scores of

Digitized by Google

others on previous occasions, to the effect that "there was one point in which Germany could boast a vast superiority, that was in her system of secondary and technical education," such statement we emphatically deny. It arises through complete ignorance of facts and through the laziness of people who accept what someone else says without proper investigation. Look round our great industries. Where do we owe anything to Germany? Is it in shipbuilding, or iron or steel manufacture, or cotton or woollen manufacture, or where? Echo answers, where? Much has been made of German enterprise relating to analine dyes. That was merely finance, nothing else. Look where you will, the result is the same. The spouters speak truths that are half truths, and, therefore, bigger lies than real lies, and more difficult to disprove. They compare an old ironworks in England with a new works in America, and draw conclusions disadvantageous to us. Why do they not compare the new with the new? Why not draw conclusions from factories under similar conditions, and not when the conditions are divergent? But we have left the Faraday Society, and have but a few more words. Its start is excellent, and we trust its career will be eminently successful. It needs support now, and all those interested in the work should give that support at once.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

LAMP TEST.

SIR,—We desire to bring to your notice a description of co-operative lamp test that we are now carrying out.

The scheme of the tests is as follows: 40 lamps, all of 16 c.p. and 200 volts pressure, have been purchased on our behalf by an independent party. There are 10 makers represented, and four lamps by each maker. The candle-power and efficiency are being measured at start and after 100, 400, 700, and 1,000 hours burning. The figures for the whole of the lamps will be embodied in our report as well as tables of averages. This report will take the form of a small book, and will be copyright. A single copy of this report will be forwarded to all subscribers of 2½ guineas, and no copies will be sold cheaper than this. The report is intended for private circulation only, and must not be copied or used for advertising purposes.

We believe that these results will be of considerable value, as the lamps are all subjected to identical conditions as to pressure variations, and are tested against the same standards. The lamps being tested are the following: Ediswan, Gabriel, Robertson, Maxim, Goossens - Pope, Sunbeam, Premier, B.T.H., Stearn, Cryselco. We regret that we are unable to test a larger number of lamps of each make, but the funds subscribed do not allow of this. We shall be glad to hear from you as to whether you would care to subscribe 2½ guineas for a copy of the report. We should be greatly obliged if you would kindly mention these tests in your next issue. The lamps have now been burning over 900 hours, and the tests should now be completed within a few days.—Yours, etc., for and on behalf of Westminster Electrical Testing Laboratories,

LANCELOT W. WILD, Chief Electrician.

FORTHCOMING EVENTS.

Sanitary Institute.—Congress and exhibition, Bradford, July 7-11.

Municipal Electrical Association.—July 15 to 18, annual convention, Sunderland. July 17, Middlesbrough Corporation luncheon.

Iron and Steel Institute.—Summer meeting, Barrow-in-Furness, September 1-4.

Municipal and County Engineers.—Meetings: Widnes, July 18; Aberdeen, August 20, 21, and 22; Hastings, September 11 and 12; York, probably in October.

Municipal Tramways Association.—Annual conference, July 8, 9, and 10, at Glasgow.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

597. Describe the electrical equipment of an electric automobile, with special reference to the motor, or motors, and wiring.—D. R.

598. In order to test high-tension cables, it is necessary to have ready means of varying the pressure to suit the test specified. Can this be done best by adding to or reducing the number of transformers in series, or what is the best way?—G. M. B.

ANSWERS.

Question No. 589.—A shunt-wound 500-volt four-pole motor drives the circulating pump of a surface condenser, and as this motor is semi-enclosed, the two bottom sets of brushes are difficult to get at for cleaning purposes, etc. It is now proposed to use two sets of brushes only instead of four. What alterations must be made to the armature in present use? and if an entire new armature is necessary, show exactly how it must be wound.

Answer to No. 589 (*awarded* 10*s.*).—There are methods of cross-connections by which the number of brush sets may be reduced, but these have, to the writer's knowledge, only been applied to ring armatures. Mordey's method of cross-connecting, used by him in the "Victoria" dynamo, consists in connecting the opposite commutator segments together. But considering the fact that the present armature is of the multiple-circuit type, and the peculiar features appertaining to this type of winding, it would probably be the best to put in a new armature, unless the constants adopted in designing are very conservative. In Fig. 1 is shown a diagram of a typical multiple-circuit

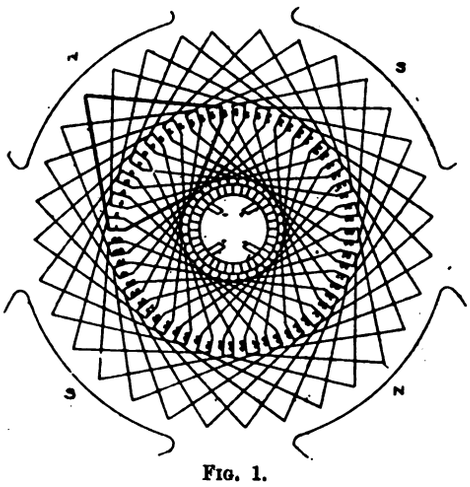

FIG. 1.

FIG. 1A.

winding. The armature, in this case, has four circuits, each conductor carrying only one-fourth of the current input to the brushes. Consider the effect of taking away the lower two brushes. Now, one section of the armature will be carrying three-fourths of the total current, and the remaining three sections one-fourth. If R be the resistance of one-fourth of the armature, and C be the current input at the brushes, then we have the "heat" loss with four brushes as

$$4\left(\frac{C}{4}\right)^2 R = \frac{C^2 R}{4},$$

and with two brushes

$$\left\{R \times \left(\frac{3}{4}C\right)^2 + 3R \times \left(\frac{C}{4}\right)^2\right\} = \frac{3C^2 R}{4}.$$

Hence we see that the "heat" loss has increased in the ratio of 1 : 3—*i.e.*, the rise in temperature of the armature will have also increased in the ratio of 1 : 3. At the commutator the losses will increase in the ratio of 1 : 2, and the radiating surface being the same in each case, the rise in temperature will increase in the ratio of 1 : 2. No account has been taken of the sparking constants, and the "reactance voltage"* of the coils undergoing commutation for the case with two brushes will be practically four times that when four brushes are employed. Hence we see that not only are the heat losses increased and likewise the efficiency decreased, but the reactance voltage has been raised to a rather dangerous amount, and that sparking will result unless the other constants of the machine are very conservative.

All difficulties, however, can be got over by using a new armature. The winding in this case would be of the two-circuit type, a typical form being shown in Fig. 2. For

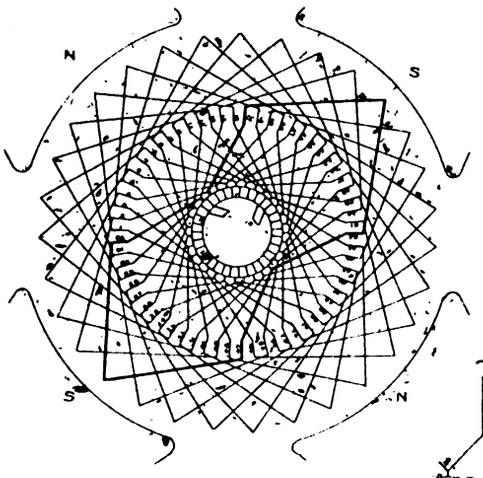

FIG. 2.

FIG. 2A.

the sake of clearness the coils are shown of one turn each, but in actual practice they consist generally of two, six, or ten turns, being arranged as in Fig. 2A, Fig. 1A showing the form of coil for multiple-circuit windings. On comparing Figs. 1 and 2 it will be noticed that in starting from one segment to the next a quarter of the winding has to be passed over in Fig. 1, but in Fig. 2 a complete "round" of the armature has to be passed over. It will be convenient to state here the formula for E.M.F.—viz., $E = \frac{4\,T\,M\,N}{10^8}$; where E is the E.M.F. generated in the armature; N, the number of magnetic cycles per second $\left(= \frac{\text{revolutions per minute} \times \text{poles}}{60 \times 2}\right)$; T, the number of turns in series between the brushes; and M, the magnetic flux linked with each of the T turns. The value of T will be equal to the total turns on the armature divided by the number of paths through the armature. Hence we see that, other things being the same, for the same E.M.F. only half the turns will be required for a two-circuit that are required for a multiple-circuit winding. It must also be noted that the conductors in a two-circuit winding have to carry double the current that they would with a multiple-circuit winding. The most important point, however, is the formula for winding. All two-circuit windings for four-pole motors require an *odd* number of commutator segments, and the number of the latter should always be prime to the number of poles. Thus, in the winding shown in Fig. 2, the number of commutator segments is 31. The general formula for two-circuit windings is

$$c = n\,y \pm 2\,m,$$

where c = number of face conductors;
n = number of poles;
m = number of windings (whether single, double, or triple);
y = average pitch.

* See "Electric Generators," by Parshall and Hobart," p. 175; also an article on "Electric Motors," by Mr. H. M. Hobart, in "Traction and Transmission," vol. iv., p. 141.

It should be noted that for two-circuit windings the pitch, y, is always *forward*, and not alternately forward and backward as in multiple-circuit windings. In all motors with two-circuit windings the armature has a single winding, two-circuit double windings being seldom used. Hence m will be unity, and the formula for a four-pole machine becomes

$$c = 4\,y \pm 2.$$

It should be pointed out that if the winding is to be singly re-entrant—*i.e.*, of the ordinary type used in motors—y must be *odd*. In the diagram shown in Fig. 2, y is chosen as 15 and c as 62. If a new armature with a two-circuit winding is put in place of the present one, and the former proportioned so that the reactance voltage of the coils undergoing commutation is low, no sparking troubles will result. Two-circuit windings have a distinct advantage over multiple-circuit windings, in that equal voltages are induced in each half of the winding, even if the armature is eccentric with regard to the field (due to wear of bearings, etc.). This, however, is not the case with multiple-circuit windings, as in this case any eccentricity of the armature causes unequal E.M.F.'s to be induced in the different portions of the winding, which set up cross currents and sparking.

The following tables may be of use in applying two-circuit windings. Table I. gives, for the case of plain two-circuit single windings, the number of conductors which are possible per slot for motors with from four to eight poles.

TABLE I.

Number of poles.	Possible number of conductors or groups of conductors per slot, for symmetrical windings.											
4	1	...	2	...	—	...	6	...	10	...	14	—
6	1	...	2	...	4	...	—	...	10	...	14	16
8	1	...	2	...	—	...	6	...	10	...	14	—

In Table II. are given data of two armatures for two four-pole, 220-volt, 35-h.p. motors, one of which is a multiple-circuit and the other a two-circuit winding.

—A. D.

Answer to No. 589 (*awarded* 10*s.*).—If, as is most usual in small 500-volt motors, the armature is a series-coupled,

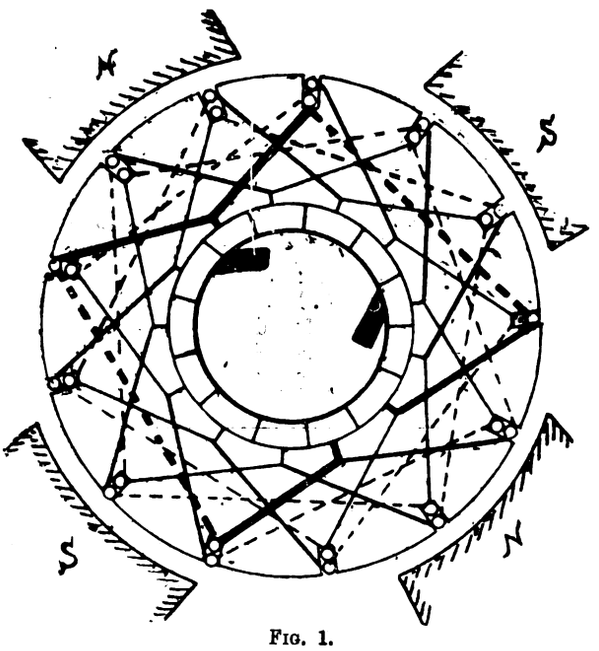

FIG. 1.

wave-wound one, the motor will run equally well with two or four sets of brushes, provided only that the commutator

Digitized by Google

is large enough for the whole current to enter at one set of brushes without overheating—*i.e.*, with a current density not exceeding, say, 50 or 60 amperes per square inch of brush contact, assuming that carbon brushes are in use. If, however, the armature is a parallel-coupled, lap-wound one, it will be necessary either to cross connect every commutator plate to the plate of equal potential diametrically

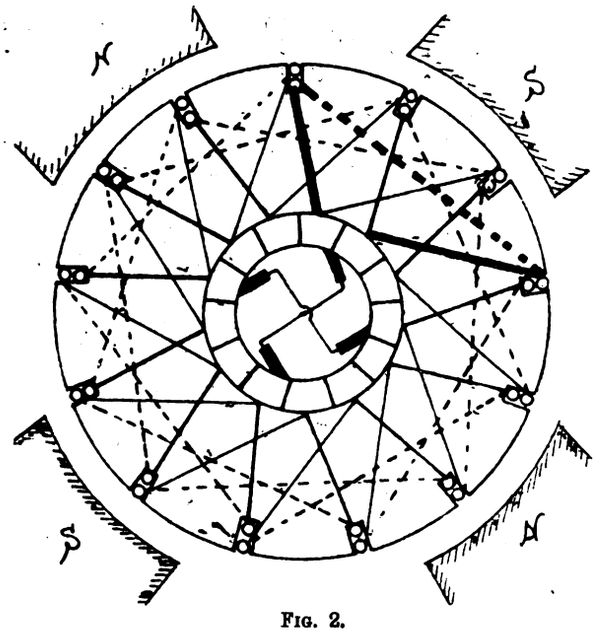

FIG. 2.

opposite to it, or else entirely to rewind it, making it into a series-coupled one. The latter alternative is preferable, as the cross-connections sometimes allow wasteful currents to circulate in the windings.

The motor mentioned has presumably a modern slotted-drum armature, and if so it will be a simple matter to determine by inspection whether it is series or parallel

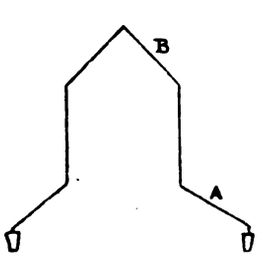

FIG. 3.

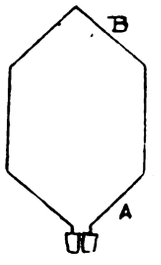

FIG. 4.

coupled. Fig. 1 shows the connections of a series-coupled armature, and Fig. 2 those of a parallel-coupled one, the dotted lines representing connections at the back and the full lines front connections. Figs. 3 and 4 show the shapes of the single coils used for series and parallel windings respectively. It will be noticed that whilst in the case of a series coil (Fig. 3) the end connection, A, at the commutator end slopes in the *same* direction

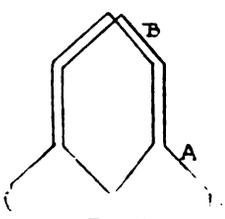

FIG. 5.

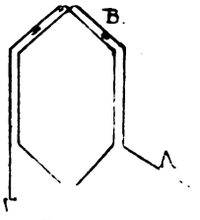

FIG. 6.

as the connection, B, at the other end, in the case of a parallel armature (Fig. 4) the slopes at the two ends are oppositely directed. If a series coil has more than one turn, as would probably be the case in this machine, only the starting connection and finishing connection of each coil will have the characteristic slope, whilst the intermediate turns will slope as in a parallel-coupled armature (see Fig. 5, which represents such a series coil). In such a case only the external connection to the commutator must be considered. Occasionally only one of the connections is sloped, the other being brought straight out to the commutator (Fig. 6), but even in this case the slope of the ends, A and B, will serve to determine the winding as before.

If from any cause the connections cannot be traced out, the point can be decided by measuring the armature resistance (not including the brush contact resistance), first with all four sets of brushes down, and then with only two neighbouring sets down on the commutator. If it is a series armature, the resistances will be alike in both cases, whilst if it is parallel coupled, the resistance will be three times as great with two sets of brushes as with four sets.

If the armature proves to be a parallel-coupled one, the cross-connections between diametrically opposite commu-

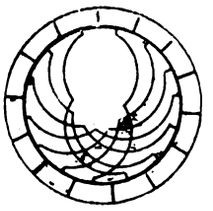

FIG. 7.

tator plates mentioned above, can be carried out (as shown in Fig. 7) by means of a series of connectors arranged in two layers. These connections will probably be best carried out at the back of the commutator, and for this purpose the whole of the commutator connections will have to be temporarily unsoldered. If, instead of cross-connecting, it is decided to entirely rewind the armature, it may be necessary to provide a new commutator, having one segment less than the present one, in order to ensure that (number of segments × 2) + 2 shall be exactly divisible by the number of poles, which is a necessary condition for series-coupled armatures. If this has to be done, there will be a slight want of symmetry in the winding—two of the slots having rather fewer conductors than the rest—but this will have no harmful effect. The actual total number of conductors must be as nearly as possible half the present number (consistent with the above change in number of commutator segments), and the area of the wire used must be double that of the present wire. The winding can then be carried out as in Fig. 1, making each coil span approximately a quarter of the periphery.—Q.

[Other answers to this question in next issue.—ED. *E. E.*]

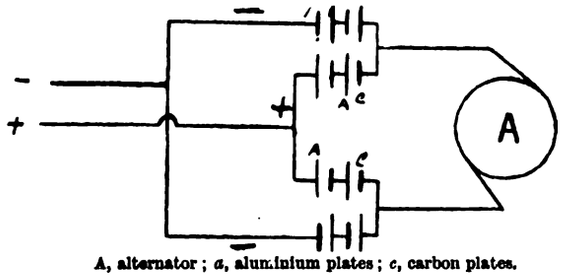
Question No. 590.—Describe fully the best way to make an aluminium rectifier for rectifying alternate current into unidirectional current, same to be suitable for working on 110-volt circuit at 50 cycles and carry one ampere. Explain how to form the aluminium plate.

Best Answer to No. 590 (*awarded* 10*s.*).—The idea of an aluminium rectifier is due to Mukelman, and its latest development to Pollak. The original observation of Mukelman was first made known in 1883 by means of *Wiedemann's Annalen*. He observed that a "formed" plate of aluminium—*i.e.*, one covered with an insulating or dielectric crust of aluminia and other compounds of aluminium—stopped the positive current, but not the other, and this, when interposed between an alternate-current generator and the wiring, secured a continuous current in the latter. The electrolyte used in the first experiment was acid (sulphuric), and the apparatus would not work with voltages above 20. With an electrolyte of potash alum 140 volts were reached, and Pollak has now reached 200, although on a very small scale.

In the latest form of apparatus Pollak uses a slightly acid solution of potassium phosphate as an electrolyte. The aluminium plates are formed by first macerating them for some time in a solution of caustic soda. The crust remains unaltered in air for an indefinite time, but gradually disintegrates in water or in aqueous solution. Hence, for the continued life of the rectifier it is necessary that the electrolyte should be run off the plates whenever the apparatus is not in use. Another important point is that the temperature, which rises during the operation of the battery, must not be allowed to reach 40deg C. above that temperature, the current is allowed to pass both ways to a large extent. The necessary regulation of temperatur e

Digitized by Google

can, of course, be effected by water jacketing the cell, but a much better and simpler plan is to use a cell in which the column of electrolyte is several times as high as the aluminium plates, then radiation and convection do all the cooling that is necessary. Such a cell can be used for four hours on end without overheating. The life of a formed aluminium plate, if overheating does not take place, is from 500 to 800 hours. Then the crust begins to crumble, chiefly on account of the action of the hydrogen bubbles. The apparatus must, of course, be quadrupled as shown in the



A, alternator; *a*, aluminium plates; *c*, carbon plates.

diagram, if both phases of the alternate current are to be made use of, so as to have the polarity of the aluminium plates reversed synchronously with the direction of the dynamo current. The smallest cell that could be made would pass one ampere, but as carbon and aluminium sheets are so cheap there is no object in making the cells too small. By inserting a variable resistance in the alternating circuit, any current desired could be obtained as long as the rise in temperature of the rectifier did not exceed 30deg. to 40deg. C. If a single cell only is used, one cannot be certain that the rectified current is truly unidirectional, as a single cell does not always keep out the positive half of the alternating current.—C. A. B.

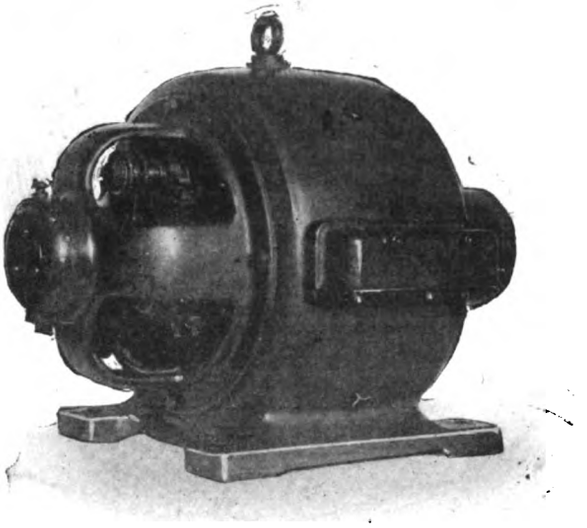
Answer to No. 590 (*awarded* 5*s.*).—The applicability of an aluminium electrode to the rectifying of an alternating current results from the remarkable fact that when employed as the anode it interposes an enormous resistance into the circuit, though behaving normally when a cathode. The very fact of this metal not being rapidly acted upon by dilute sulphuric acid is in itself peculiar, since it is rapidly dissolved by hydrochloric acid and many salt solutions, moreover, even by pure water. Though the abnormal behaviour of aluminium was noted so long ago as 1854, when Wheatstone was determining its place in the voltaic series, it was not till 1897 that Pollak and Grätz independently proposed its employment, in conjunction with a carbon cathode, for rectification. Of recent years, though by no means very efficient, this application has been brought into much prominence. The cause appears to be that the anode becomes coated with a layer of hydroxide, $Al(OH)_3$, through which the ions Al and SO_4 are unable to diffuse. This view of the matter has, indeed, been proved by the work of Taylor and Inglis, who constituted an anode of platinum coated with the hydroxide, which had the same property.

To construct a rectifying cell it is only necessary to immerse a piece of sheet aluminium—for one ampere about 4in. by 6in.—and a carbon or other plate or rod in dilute sulphuric acid. The positive of the rectified circuit is connected to the carbon, the negative and the aluminium to the alternating mains. It must not be assumed, however, that the current will be entirely rectified at the frequency mentioned, for, as shown by Wilson, transformation is not complete at a higher frequency than 15. There will be only a preponderating current in one direction, and this becomes less and less excessive as the frequency is raised. The action may nevertheless be made more effective if several such cells are placed in series.—Z.[2]

TRADE NOTICES AND NOVELTIES.

Continuous-Current Motors.

The latest type of motors of the Electrical Company, Limited, has been designed to meet the growing demand for machines occupying small space and of light weight, and possessing a large overload capacity. The chief characteristic of this type is that the brushes are fixed independently of the load. The machines are of the protected (semi-enclosed or enclosed) type, and are shunt or series wound, but larger machines can also be compound-wound. The machines are so rated that at the end of a continuous run of six hours at full load the temperature of no part of the machine will exceed 80deg. F. above the surrounding atmosphere in the semi-enclosed tope, or 90deg. F. in the fully enclosed type. The machines from E.G. 5 to E.G. 100 are designed to stand an overload of 25 per cent. for one hour, the larger machines 25 per cent. for two hours, without undue heating or sparking at the brushes. The two smallest types, E.G. 5 and E.G. 10, are two-pole machines; the larger types, E.G. 20 to E.G. 650, are of the four-pole type. The field magnets are accurately bored and designed to ensure a perfect magnetic balance of the armature. The poles are constructed of laminated wrought iron, firmly attached to the cast-iron frame. The bearings are carried on brackets, which are bolted on to the frame. These brackets are so designed that the motor can be fixed either on floor, wall, or ceiling. The bearings are provided with self-oiling rings and means for drawing off the oil. The openings in the bearing brackets are closed by covers, fitted with felt gaskets. These covers are provided with small handles, so that they can be easily removed for inspection of brushes. The field coils are former-wound, wrapped in insulating cloth, dipped in insulating varnish, and thoroughly baked, so as to be absolutely impervious to moisture. They are arranged on the poles so as to be well ventilated by the revolving armature, and thoroughly protected against mechanical injury.



Electrical Company's Continuous-Current Motor, latest type E.G.

The armature is of the slotted drum type, the core being built up of laminated iron firmly secured to the shaft. Ventilating channels parallel to the shaft are provided. The armatures of the larger machines are also provided with space between the laminations to ensure a more efficient ventilation. The armature coils are former-wound, impervious to moisture, and furnished with thoroughly damp-proof insulation. The commutator is built up of hard-drawn copper bars of high conductivity, insulated from one another and the sleeve with mica. The brush-gear is designed for carbon brushes, each brush having a separate spring to take up the wear automatically. The tension of the springs is adjustable, so that a constant pressure on the commutator is obtained, even when the brushes are worn down. The screw fixing the position of the brush-gear in the smaller sizes is intentionally placed in an inaccessible position, so that the brushes cannot be moved. The terminals are outside the motor, and are protected by a metal hood. Separate terminals are provided for armature and field windings. The insulation has been made a special feature of this type. We are informed that it has proved thoroughly reliable under the most adverse conditions, and that, in order to put it to the severest test, the firm erected some months ago an open type motor on the roof of their premises, and have left it exposed night and day in all conditions of weather since its erection.

Patent Filters.

Messrs. Bell Bros., 41, Corporation-street, Manchester, and Calder Ironworks, Ravensthorpe, Yorks, have just issued an illustrated pamphlet descriptive of the Bell patent process for purifying and softening all classes of river, well, or other waters for bleaching, dyeing, wool-scouring, milling, paper-making, cotton spinders, silk manufacturers, laundries, wire works, hydraulic works, boilers, and other purposes; also for water supplies of cities, towns, etc., and for purifying sewage and factory effluents, also for purifying black soda lye in soda-recovery plants, and the purifying of sugar, etc. We are informed that over 25,000,000 gallons of water are purified by

Digitized by Google

this system per day, and refer our readers to the booklet for details of the process.

Safety Wiring.

The illustration herewith shows a display of the Simplex Steel Conduit Company's fireproof system of conduits and fittings for safety electric wiring. It consists of two cases arranged on stands, made up of the conduit and fittings of the company's manufacture, with roof to each and boards at the back on which are mounted the various fittings and accessories, showing their application. The front is left free for a framework of tubes on which lamps are connected up by means of ceiling-rose boxes, pendant boxes, lampholder fittings, etc. On the horizontal tubes are shown a number of porcelain connection fittings having the inspection covers removed so that the wires may be seen connected to the terminals on the porcelain interiors. This arrangement illustrates how with a complete system of this kind the whole of an installation may be readily tested and inspected throughout by the removal of an inspection cover. The tubes and fittings are shown enamelled and galvanised for screwed or socketed junctions and are of a first-class finish, all the fittings being subjected to a sand-blasting process before leaving the works, and the tubes have a smooth bore throughout, so that no abrasion of the wires can take place when erecting. In the cases and on the panels at the back are shown the more important of the fittings, as bends, tees, junction, draw-in and branching boxes, also saddles, crampets, and clips for erecting, together with plugs for fixing to the walls of a building.

Safety Electric Wiring.

PERSONAL.

We offer our hearty congratulations to Mr. John Gavey, engineer-in-chief to the Post Office, on his appointment to the Companionship of the Bath. Although Mr. Gavey is an eminently worthy representative of electrical engineering, we should have liked to have seen the names of a few more members of the profession figuring in the list of birthday honours this year. As it is, he stands alone in his well-merited honour, and we are sure that he has the best wishes of all who are acquainted with the excellent work he has done in the past 30 years in connection with the Post Office telegraphs.

Mr. Leonard Andrews, joint managing director with Mr. C. J. Cowan of the Key Engineering Company, returned last week from a six weeks' trip to the United States. We are informed that the primary object of Mr. Andrews's visit was to assist the Stanley Manufacturing Company in the development of his United States patents, which were acquired by that company last year, and that he has also succeeded in transacting a considerable amount of other business, both in introducing English engineering specialities in the American market and in the obtaining and handling of several American novelties, which will shortly be put on the English market by the Key Company. Mr. Andrews is resigning his appointment of consulting engineer to the Hastings Corporation, so that he will be able to devote his entire attention to the management of the Key Company in the Manchester and Northern district. Mr. Cowan will look after the company in the London and southern district.

Mr. C. Jones has been appointed chief electrical engineer to the Metropolitan Railway.

Mr. H. Waring, of Mexborough, has been appointed resident electrical engineer at Todmorden at a salary of £250 a year.

In our issue of May 29 we pointed out that Mr. A. M. Thompson, M.I.C.E., M.I.E.E., had taken charge of the electrical and telegraph work of the London and North-Western Railway Company. He has also been appointed electrical engineer to the company from July 1 in succession to Mr. J. W. Fletcher, who retired from the service on that date. His office will be at Crewe.

The Electric Lighting Committee of the Edinburgh Town Council recommend the salary of the resident electrical engineer to £850.

APPOINTMENTS VACANT.

Tramway Manager, Corporation of Walsall, £200 a year, July 11.

Working Foreman Platelayer, East Ham Tramways, £3 per week.

Mains Foreman, W. E. Milns, Electricity Works, Grantham, £2 per week.

Electrical Engineer, Aldershot Urban District Council, £200 per annum, July 8.

Assistant Electrical Engineer, Corporation of Torquay, £156 per annum, July 20.

Assistant Electrical Engineer, Llandudno Urban District Council, £100 per annum, July 11.

Electric Lighting Engineer, Municipal Corporation of Port Elizabeth, Messrs. Davis and Soper, £600 per annum, July 9.

LEGAL INTELLIGENCE.

HULL TELEPHONES.

Mr. Justice Buckley, in the Chancery Division of the High Court, gave judgment on Saturday in the case of the National Telephone Company *v.* the Mayor, etc., of Kingston-upon-Hull, which raised the question whether under the Telegraph Act of 1899 the Telephone Company were entitled to a renewal of their license to maintain and use a telephone system in the city and county of Hull.

His Lordship read a written judgment dealing *in extenso* with the various Acts of Parliament bearing on the case from the Telegraph Act of 1863 down to 1899. He said the result of the various Acts was that the Postmaster-General had a monopoly, with the right to grant licenses of the telephonic and telegraph systems, subject, however, to the obligation to obtain the consent of the district authority where an underground system was contemplated. The Telephone Company had laid down systems under license from the Postmaster-General, and had sold to the Post Office their trunk lines, retaining the local areas, amongst which was Kingston-upon-Hull. By an agreement between the company and the Corporation, dated November, 1897, the company were licensed to exercise all the powers of the Postmaster-General, with a proviso, however, that where the system was to be underground further consent of the Corporation should be obtained. In 1899 the Corporation obtained an Act authorising them to lay down a telephone system in their area, but the Act contained a proviso that where there was already a system under license from the Postmaster-General that license should be continued for the period of the license granted to the Corporation. The Corporation of Kingston-upon-Hull were alarmed, as he thought unnecessarily, at a clause it was proposed to introduce in the Bill, and they gave the company notice, as they were entitled to do, to determine the agreement, and on Aug. 3 they passed a resolution to determine six months from that date. The Act was passed on Aug. 9, 1899, but the Corporation did not obtain their license until February, 1900, long after the expiration of the notice. He held that the resolution determining the agreement was validly passed. The company's system only existed on sufferance. They could therefore not claim the benefit of the Act, and he must dismiss the action with costs. His Lordship expressed a hope, however, that some arrangement would be come to which would avoid idle waste of money in taking up the company's system and laying down a new one.

COMPANIES' MEETINGS AND REPORTS.

BRITISH ALUMINIUM.

The report states that the profit for the year ended Dec. 31, 1902, is £20,770. This is insufficient to meet the debenture stock interest, depreciation on plant, etc., and charges on stocks of metal by £3,392, and the debit balance has therefore been increased by this sum to £22,357. In accordance with the arrangements made with the debenture holders last autumn, payment of interest due on Nov. 1, 1902, and May 1, 1903, was postponed, and deferred warrants have been issued to the stockholders for the amounts accrued due to them. The £10,000 authorised to be raised in priority to the debenture stock was borrowed in January last, and £2,000 has since been repaid. The sales of aluminium continue to increase so satisfactorily that the Board has deemed it necessary to take steps to extend the water-power installation at Foyers by the erection of two more dynamos, and to increase the capacity of output of the several works of the Company. These extensions will involve considerable expenditure, which the Board hopes to provide without making any fresh issue of capital or increasing the debenture debt. Relations with the other aluminium producers continue to be of a friendly character. The original understanding with them was modified last January to the future advantage of the Company. A considerable reduction in the cost of the manufacture of carbide has been effected, which justifies the Company continuing this branch of the business.

J. G. WHITE AND CO.

Presiding over the ordinary general meeting of the shareholders in this Company, held at the offices, College-hill, E.C., Lord Arthur Butler said the profit and loss account for the half-year ended Feb. 28 last showed a balance of profit of £14,628, which compared favourably with former results. After bringing forward the balance from the last report—namely, £11,469—the total to the credit of profit and loss was £26,097. Generally speaking, he thought the accounts showed a distinct advance in the position of the Company as compared with former years. The capital had hitherto proved sufficient for the Company's construction business, but recently several favourable propositions had been under consideration, in which the question of financial assistance was an important factor, and the directors find it advisable, in order to extend the scope of business, to propose a further increase in the capital of the Company. The Company had recently tendered for the complete construction of the Derby Corporation tramways, and he was glad to be able to say that the committee of the Council had recommended its acceptance. With regard to the proposed method of declaring dividends, he should explain that the result of the half-year's trading quite justified the declaration of a 10 per cent. dividend on both classes of shares; but if this plan were adopted without explanation, shareholders would, no doubt, look for a continuance of dividends at the same rate, and this the directors considered, when coupled with the necessity for providing a reserve fund, might be placing too heavy a burden on the resources of a young company. For this reason it was proposed to adopt the policy of declaring a dividend at a rate which the directors considered, from the business outlook, the Company would be able to maintain for the ensuing year, and a special dividend based entirely on the results of the trading in the past half-year. He moved "that the directors' report and statement of accounts, as at Feb. 28, 1903, be and are hereby received and adopted."

Mr. A. N. Connett seconded the motion, which was then put and carried unanimously.

The **Chairman** next moved: "That dividends be sanctioned and declared as follows: (*a*) a dividend, free of tax, at the rate of 8 per cent. per annum on the 6 per cent. cumulative preference shares for the half-year to Feb. 28, 1903, absorbing £3,258. 13s. 4d.; (*b*) a dividend, free of tax, at the rate of 8 per cent. per annum on the ordinary shares, for the half-year to Feb. 28, 1903, absorbing £2,000; (*c*) a special dividend, free of tax, at the rate of 2 per cent. per annum on the preference and ordinary shares for the half-year to Feb. 28, 1903, absorbing £1,314. 13s. 4d."

Mr. W. C. Burton seconded the motion, which was unanimously agreed to.

The sum of £5,000 was allocated to reserve fund, and £14,525 2s. 3d. was carried forward to the next account.

ELECTRIC CONSTRUCTION.

The annual report of the directors to May 31 last states that the net profit for the year is £20,736. 19s. 9d., and, adding the balance brought from last year, £3,504. 6s. 1d., the amount available for distribution is £24,241. 5s. 10d., which the directors recommend should be appropriated as follows: dividend at the rate of 7 per cent. per annum on the preference shares (to be paid on July 31 next), £4,394. 12s.; dividend at the rate of 6 per cent. on the ordinary shares (one-half to be paid on July 31 next, and one-half on Jan. 30, 1904), £13,452; general reserve fund, £2,000; balance carried forward to next account, £4,394. 13s. 10d.—total, £24,241. 5s. 10d. The general reserve fund will then amount to £34,000. The buildings and plant have, as formerly, been thoroughly maintained out of revenue, and £5,000 has been credited to depreciation account, which now amounts to £48,000. The past year has developed increased competition among both home and foreign manufacturers of electrical machinery, with the consequent reduction in prices, but the Company has successfully maintained its position, and the net result of the business is approximately the same as last year. The directors have, therefore, much pleasure in recognising the ability and skill of the management and men by recommending the distribution among them of the usual bonus. The new financial year opens with a larger volume of orders in hand than at the same time last year, including contracts for two important installations of electrical plant, one for his Majesty's Government in Gibraltar and the other for the Corporation of Wellington, New Zealand. The traffic and net revenue of the Madras electric tramways continue to grow satisfactorily, and according to the present prospects the improvement will be more than maintained in the current year.

RAND CENTRAL ELECTRIC WORKS.

On Friday the annual meeting of the shareholders was held at Winchester House, Sir C. Rivers Wilson presiding.

The **Chairman** expressed the hope that the shareholders would view the report in the light of the circumstances which had prevailed during the period under review. The military guard in charge of their works was not withdrawn till June, and it would readily be understood that the influence of the war affected the Company's operations during the whole of 1902. Dealing with the accounts, he pointed out that the balance of their claim against the Imperial Government in respect of damage to the plant done by the Boers amounted to £2,729. The Company's works were attacked in consequence of the assistance which they were able to render to the military authorities, so that he thought they had good grounds for their application for compensation. Before the outbreak of hostilities they had contracts with mines using 980 stamps. Only 225 of these were working at the commencement of the year under review, and the number gradually increased until it reached 530 at Dec. 31 last. So soon, however, as the mines were able to use the full power contracted for, and other contracts which were under consideration had been concluded, the Company's plant would be taxed to its utmost capacity. The Board had come to the conclusion that the time had arrived to provide additional plant, and with that object had ordered a fifth engine. It was expected that the cost would be £30,000, but arrangements had been made to find the money without calling on the general body of shareholders. The prospects of the Company were decidedly good. New fields were being opened up in the direction of their works, and that fact alone pointed to the probability of their having to meet a demand for a considerably larger amount of power. He concluded by moving the adoption of the report.

Mr. G. Zwilgmeyer seconded, and the motion was adopted unanimously.

ELECTRIC AND GENERAL INVESTMENT.

The report of the directors for the year ended May 31 last states that the profit and loss account shows a gross profit on the transactions of the year of £19,424. 10s. 5d. After deducting all general charges and the interim dividends already paid on the preference and ordinary shares, and providing for the proportion of the final dividend accrued on the preference shares to May 31, 1903, there remains a net balance of £8,996. 19s. 7d., to which the directors propose to add, by transfer from "provision for contingencies," £1,003. 0s. 5d., making a total of £10,000. The directors recommend that this amount be distributed as follows: ordinary shares—to the payment of a dividend of 5s. per share for the year ended May 31, 1903, of which 2s. per share was paid *ad interim* in December, 1902, leaving 3s. per share to be paid on July 8, 1903, £3,000; to the payment of a bonus of 2s. per share for the year ended May 31, 1903, £2,000; to the payment of a dividend of £50 per share for year ended May 31, 1903, on founders' shares, £5,000—total, £10,000. The trustees for the ordinary shares reserve fund propose to distribute to the holders of such shares a sum of 6d. per share, making, with the above-mentioned dividend and bonus, a total present distribution of 5s. 6d. per share, or 7s. 6d. for the year on each ordinary share. The trustees for the founders' shares reserve fund propose to distribute to the holders of such shares a sum of £5 per share, making, with the above-mentioned dividend, a total distribution of £55 on each founders' share for the year. The above-mentioned payments will be subject to the deduction of income tax.

ELECTRICAL POWER STORAGE.

In their report on the year ending May 31 last the directors state that the profit for the year, including the balance of £854. 14s. 9d. brought forward, is £11,983. 17s. 10d. Out of this sum the directors have carried £5,000 to the reserve fund and £1,000 to the contingent fund. They recommend the payment of a dividend of 6 per cent. on the ordinary share capital, which will absorb a further £5,389. 13s. 7d., and leave £594. 4s. 3d. to be carried forward. The buildings, plant, tools, etc., have been maintained in thorough repair and condition at a cost of £3,502. 9s. 8d., which sum has been provided out of revenue. The directors have again to record an increase in the business, the output having exceeded that of any previous year. Every type of cells has been represented in the increase, power, lighting, automobile, and launch cells having all been in larger demand. In consequence of the numerous orders received, especially for the Company's largest types of cells, it has been found necessary to increase the forming space at the works. A new floor has, therefore, been added to the main shop at Millwall to enable the Company to keep pace with the orders received. During the year the Company has installed batteries in many of the largest central stations in the kingdom, and the number of repeat orders received affords most satisfactory evidence of the efficiency and value of the Company's manufactures.

DUDLEY, STOURBRIDGE, AND DISTRICT ELECTRIC TRACTION.

The report of the directors for the year ended Dec. 31, 1902, states that the gross receipts for the year amounted to £41,828. 8s. 2d., and the expenditure to £30,463. 1s. 2d., including £2,000 placed to depreciation and renewals account, interest on debentures from date of issue, cost of repairs and maintenance, and all other expenditure properly chargeable against revenue, leaving a net profit of £11,365. 7s. After deducting the dividend on the preference shares accrued to Dec. 31, 1902, and adding the balance of £600. 0s. 4d. brought forward from the last account, there remains an amount available for distribution of £6,965. 7s. 4d. This the directors recommend should be applied as follows: to be placed to the reserve (sinking fund), £2,100; to the payment of a dividend at the rate of 4½ per cent. per annum on the ordinary shares, £4,500; to be carried forward to the next account, £365. 7s. 4d. During the past year £60,000 4½ per cent. debenture stock has been issued. The expenditure chargeable to capital account during the year amounted to £46,114. 0s. 6d., making the total amount expended to date on electric traction £284,514. 14s. 2d. The extension through Stourbridge to Lye was opened on Nov. 1 last. In order to cope with the increasing traffic, eight additional cars of large carrying capacity have been purchased. A Bill is being promoted in the present session of Parliament to confirm the agreements made with the various local authorities for the extension of the tenure, and to authorise the local authorities of the districts served by the Company to grant leases to the Company of the lines within their area, after they have purchased same, and for other general purposes.

NEW GENERAL TRACTION.

The report of the directors for the year ended March 23 last, to be presented at the meeting on the 2nd prox., shows gross profits for the year £11,585, after charging the sum of £5,714 for general expenses, salaries, directors' fees, interest on loans and legal expenses. After deducting £9,064, being 5 per cent. interest on the Company's outstanding mortgage debentures up to March 23 last, there remained a balance of £2,521. To that balance has to be added the sum of £11,662 brought forward from last year, making a total amount of £14,183 standing to credit of profit and loss account. The directors recommend that this should be carried forward. The disappointing results of the past year are attributed to the prolonged delay in completing the tramways belonging to the Philadelphia, Morton, and Swarthmore Street Railways Company, of which this Company holds the securities, and the bad weather during the spring and summer of 1902, which seriously affected the earnings of all the company's English tramways. In last year's report it was mentioned that the completion of the Philadelphia system was dependent upon a decision of the Supreme Court then awaited from day to day. That decision was not given until Oct. 13 last, and the judgments of the Lower Court and of the Court of Appeal were thereby reversed. As a result the Company could not make the short connection with the terminus in Darby as originally planned. Upon the occasion of Mr. Hopkins's recent stay in Philadelphia measures were taken to overcome the difficulties which had thus arisen. New rights of way into Darby have recently been acquired, and the laying of the track is now proceeding satisfactorily.

BRITISH ELECTRIC TRACTION.

The report of the directors for the year ended March 31, 1903, states that the profits, including £27,438. 7s. brought forward from last year, amount to £266,399. 18s. 10d. This does not take into account the premiums, amounting to £90,337. 4s., received in respect of new share and debenture capital, and which have been carried direct to reserve. After deducting the proportion of general expenses chargeable to revenue, and also the expenses incurred in connection with schemes not proceeded with and written off, contributions to superannuation fund, and interest on debenture stock, there remains a net profit of £208,161. 14s. 11d., which the directors propose should be applied as follows: reduction of licenses and testing of new systems account, £2,500; reduction of furniture account, £551. 13s. 7d.; dividend at the rate of 6 per cent. per annum on the preference shares for the year ended March 31, 1903, including the dividend paid to Feb. 15, 1903, and proportion of dividend payable Aug. 15, 1903, accrued to date, £74,760. 9s. 7d.; dividend at the rate of 10 per cent. per annum on the ordinary shares for the half-year ended March 31, 1903, making with the interim dividend at the rate of 6 per cent. per annum paid for the half-year ended Sept. 30, 1902, a total distribution of 8 per cent. for the year, £105,437. 0s. 9d.; carried forward to next account, £24,912. 11s. The reduction of the dividend on the ordinary shares by 1 per cent. for the year is mainly due to a larger amount of new capital having been raised during the past year which has not yet become productive of profit, though ranking for dividend. Capital account: In June, 1902, 20,000 ordinary shares were allotted to the shareholders at par in accordance with the proposal approved by the shareholders, and contained in the last annual report of the directors. In November last an issue was made of 75,000 preference shares at the price of £12 per share; 37,500 shares of this issue were underwritten for a commission of 10s. per share, and 37,500 shares were allotted. A further 3,213 ordinary shares and 11,447 preference shares have also been issued as fully paid up to the holders of 32,130 ordinary shares, and 68,682 preference shares of the Brush Electrical Engineering Company, Limited, in exchange for their shares in the Brush Company. There have been issued as fully paid-up 8,853 ordinary shares and 7,490 preferenee shares in exchange for shares in the Electrical Power Distribution Company. The absorption by the Company of the Electrical Power Distribution Company has been completed, and the latter company is now in course of liquidation. There has also been issued £212,912 5 per cent. perpetual debenture stock, and £35,754. 5s. 8d. has been received on account of further stock to be issued. The total premiums received in respect of these issues, after deducting the expenses, amount to £90,337. 4s., and the whole of this amount has been added to reserve, which at the date of the accounts stood at £550,042. 8s. 10d. The subscribed share and debenture capital at March 31, 1903, was £1,320,660 in ordinary shares of £10 each, £1,564,370 in 6 per cent. cumulative preference shares of £10 each, £1,023,818 in 5 per cent. perpetual debenture stock—total, £3,908,848. Contracts and undertakings: The balance under this head, after deducting the cost of undertakings transferred, and after writing off expenses incurred in respect of schemes not proceeded with, but including a proportion of general expenses, is £214,048. 0s. 8d., made up as follows: expenditure on works and undertakings for account of other companies, £36,827. 8s. 5d.

Digitized by Google

expenditure on works and undertakings owned or leased by British Electric Traction Company and for general stores £116,744. 2s., less reserved £4,000, leaving £112,744. 2s.; and expenditure in connection with schemes in course of development, and on Acts of Parliament, light railway orders, and other rights and powers secured or in course of promotion, £64,468. 10s. 3d. Investments: The total amount of investments, after deducting cost of securities sold, stands at £3,569,658. 5s. 8d. Borrowing powers: The directors intend to ask the shareholders to increase the borrowing powers of the directors upon debentures or debenture stock up to an amount equal to the subscribed capital of the Company. This will enable the directors to raise upon second debenture stock ranking subsequent in point of charge an amount equal to the 5 per cent. perpetual debenture stock now authorised. The directors are of opinion that the security of the first debenture holders will be improved thereby, and that the ordinary shareholders should benefit by a decrease in the average cost of the capital of the Company. Directors: the Right Hon. Lord Rathmore has resigned his seat at the Board. The directors who retire this year are Sir Charles Rivers Wilson, G.C.M.G., C.B., and Mr. John S. Raworth, and both are eligible for re-election.

ABSTRACT OF BALANCE-SHEET.

Liabilities.	£	s.	d.
Capital authorised—200,000 6 per cent. cumulative preference shares of £10 each, and 200,000 ordinary shares of £10 each	4,000,000	0	0

NEW COMPANIES REGISTERED.

Universal Insulator, Limited (77,770).—Capital, £10,000. Object: to adopt an agreement with L. Grote and E. Perry to manufacture, buy, sell, let on hire, license, or royalty or otherwise deal in electric insulators and moulded articles of any kind, and to carry on the business of mechanical and electrical engineers and manufacturers, etc.

Henley's (South Africa) Telegraph Works Company, Limited (77,781).—Capital, £2,000. Objects: to carry on in South Africa or elsewhere the business of electricians, telegraph and telephone engineers and contractors, submarine, cable, telegraph, and telephone instrument manufacturers, wire drawers, galvanisers, wire rope makers, and engineers, producers of light, heat, or power by electricity, galvanism, or magnetism, etc., in South Africa or elsewhere. Registered office: 27, Martin's-lane, Cannon-street, E.C.

CONTRACTS FOR ELECTRICAL SUPPLIES.

West Ham.—The Corporation require tenders for cables, etc., by July 14.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Ipswich.—The Corporation invite tenders for the supply and delivery of electricity meters by July 14.

Poplar.—The Electricity Committee of the Council invite tenders for the supply of arc lamp carbons by July 8.

Hornsey.—The Urban District Council invite tenders for ventilating fans and wiring and fittings for electric light. Tenders by July 6.

St. Pancras.—The Borough Council invite tenders for the wiring and fitting of the Goldington-buildings, Great College-street. Tenders by noon on July 8.

St. Pancras.—The Borough Council invite tenders for supplying about 31 miles of lead-covered and armoured cable. Tenders by 12 noon on July 14.

St. Pancras.—The Borough Council invite tenders for supplying an electric jenny and grab to their King's-road power house, Camden Town, N.W., by July 14.

Cairo.—Tenders will be received at the Central Office, Sanitary Department, up to 11 a.m. on July 11, for the proposed electric light installation at Kasr-el-Aini.

Madrid.—The Post and Telegraph Department require tenders for the laying and supply of telegraph cable from Fernando Po to Cameroon. Tenders by July 10.

Hammersmith.—The Borough Council invite tenders for the supply of 40 alternating-current series arc lamps and accessories. Tenders by July 15. See advertisement.

West Ham.—The Borough Council invite tenders for the supply of high-tension paper-insulated cable for tramway feeders and of multicore telephone and pilot cables. Tenders by July 14.

Stepney.—The Electrical Committee of the Borough Council invite tenders for the supply of feed, suction, and other pipework, water-softening plant, and storage tanks. Tenders by July 21.

Ipswich.—The Corporation invite tenders for the supply and delivery of electricity meters. Particulars may be obtained at the office of Mr. Will Bantoft, town clerk, Town Hall, Ipswich. Tenders by 14th inst.

Barnstaple.—The Corporation invite tenders for wiring, lamps, fittings, switches, etc. Particulars may be obtained from Mr. W. H. Trentham, 39, Victoria-street, Westminster. Tenders by July 16. See advertisement.

Lisbon.—The Public Works Department require tenders for the construction of 1m. gauge light railways as follows: (1) Limatal, Vianna-Ponte de Barca; (2) Oberer Minho, Braga-Monçao; (3) Braga-Guimaraes. Tenders by Aug. 1.

London, N.W.—The St. Pancras Borough Council invite tenders for the supply of about 350,000 carbons. Particulars may be obtained upon application at the Electricity Department Offices, 57, Pratt-street, N.W. Tenders by 14th inst.

Aberdare.—The Urban District Council invite tenders for the installation of call bells between the central fire station and the residences of the firemen. Particulars may be obtained at the Surveyor's Office, Town Hall. Tenders by 11th inst.

Leicester.—The Tramways Committee invite tenders for the erection of the car-sheds, workshops, stores, etc. Particulars may be obtained at the office of Mr. E. George Mawbey, M.I.C.E., engineer, Town Hall, Leicester. Tenders by 10th inst.

London, W.—The Hammersmith Borough Council invite tenders for supply of 40 alternating-current series arc lamps and accessories. Particulars can be obtained from the engineer, Mr. G. G. Bell, Electricity Works, 57, Fulham Palace-road, W. Tenders by July 15.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

St. Pancras.—The Borough Council invite tenders for the supply of about 350,000 carbons of various lengths and diameters for 12 months. Specifications, etc., can be obtained at the Electricity

Digitized by Google

Department Offices, No. 57, Pratt-street, N.W. Tenders by July 14 at noon.

London, N.W.—The St. Pancras Borough Council invite tenders for supplying about 31 miles of lead-covered and armoured cable. Particulars may be obtained upon application to the Chief Clerk, Electricity Department Offices, 57, Pratt-street, N.W. Tenders by July 14.

Bath.—The Corporation invite tenders for the supply and erection of a jet condensing plant, etc. Particulars may be obtained from the consulting engineers, Messrs. Kincaid, Waller, Manville, and Dawson, 29, Great George-street, Westminster. Tenders by July 17. See advertisement.

Derby.—The Electric Lighting Committee invite tenders for the supply of accumulators, balancers and reversible boosters, and switchboards. Particulars may be obtained from Mr. T. P. Wilmshurst, borough electrical engineer, Full-street, Derby. Tenders by July 13. See advertisement.

London, E.—The Electricity Committee of the Poplar Borough Council invite tenders for the supply of arc lamp carbons. Particulars may be obtained at the offices of the Borough Electrical Engineer, Electricity Works, Glaucus-street, Bromley-by-Bow, E. Tenders by 8th inst.

Bradford.—The Corporation invite tenders for works required in the erection of a new electricity station at Sunbridge-road destructor works. Particulars may be obtained on application to Mr. F. E. P. Edwards, A.R.I.B.A., city architect, Whitaker-buildings, Brewery-street. Tenders by 7th inst.

London, N.W.—The St. Pancras Borough Council invite tenders for supplying an electric jenny and grab to their King's-road power-house, Camden Town, N.W. Particulars may be obtained upon application to the Chief Clerk, Electricity Department Offices, 57, Pratt-street, N.W. Tenders by July 14.

Sleaford.—The Urban District Council invite tenders for supply and erection of water-tube boiler with piping, and 90-kw. steam generator and switchboard panel. Particulars may be obtained from Mr. R. G. Spencer Yates, A.M.I.E.E., engineer, Electricity Works, Sleaford. Tenders by 10th inst. See advertisement.

Launceston (Tasmania).—The Mayor and Aldermen invite tenders for the supply of 500 or more electric meters. Particulars may be obtained on application to Mr. William Corin, city electrical engineer, Launceston, Tasmania, or to Messrs. John Terry and Co., 7, Great Winchester-street, London, E.C. Tenders by Sept. 28.

Heston and Isleworth.—The Urban District Council invite tenders for the supply of steam-engines, dynamos, boosters, etc., storage batteries, cables, and arc lamps and glow lamps. Particulars may be obtained from the Council's engineers, Messrs. J. and J. S. Enright, 47, Victoria-street, S.W. Tenders by 23rd inst. See advertisement.

Leek.—The Urban District Council invite tenders for the supply and erection of switchboard and connections, balancing transformer and motor-generators, storage batteries, and travelling crane. The specifications, plans, etc., can be obtained from Messrs. Burstall and Monkhouse, 14, Old Queen-street, Westminster, S.W. Tenders by 12 noon on July 9.

Weymouth and Melcombe Regis.—The Corporation invite tenders for the supply, delivery, and erection of the following in connection with the electric lighting of the town: Lancashire boilers, engines and dynamos, overhead travelling crane, switchboard and battery boosters, storage battery, arc lamps and arc lamp posts, pipework, feed pumps, economiser, ejector condensers, etc., distributing mains and feeders, by July 19.

RESULTS OF TENDERS.

West Ham.—The Town Council have accepted the tender of Walker Bros., Limited, for the construction of corrugated iron tramcar sheds, at £1,099.

Rotherham.—The Town Council have accepted the tender of R. Taylor and Sons, Marsden, at £1,280, for two boilers in connection with the electric light.

Maidenhead.—The Town Council have accepted the tender of Mr. W. B. Theaker for the extension of the central-station buildings in Braywick-road, at £874.

Barnsley.—The Electricity Committee recommend that the tender of Messrs. Ferranti and Co. for the extensions of the switchgear at the electricity works, at £375, be accepted.

Derby.—The Tramways Committee have recommended for acceptance the tender of J. G. White and Co., at £87,627. 10s., for the construction of the permanent way and the provision of electrical equipment and cars.

Derby.—The Electric Lighting Committee have, subject to the approval of the Council, accepted the tender of Messrs. Radford and Greaves, at £449. 10s., for building the boiler foundations, etc., at the electricity works.

London, E.—The Stepney Borough Council have accepted the tender of J. Richmond and Co., 30, Kirby-street, Hatton-garden, E.C., for a suspended electric goods lift in the large store at the Wentworth-street depôt, at £220.

Ilford.—The Urban District Council have accepted the tender of W. Newbold and Co., Pearl-buildings, London Bridge, S.E., at £384. 5s., for the supply of machinery and tools in connection with their electric tramways.

Islington.—The Electric Lighting Committee recommend that the seal of the Council be affixed to a contract with the Electrical Construction Company for the supply of thirty-seven 30-kw. transformers at £2,966. 10s. 6d.

Leicester.—The Tramways Committee recommend that the contract for the supply of cars be divided between Messrs. Dick, Kerr, and Co., Preston, and the Brush Company, Loughborough.

Croydon.—The Town Council have accepted the following tenders: British Insulated and Helsby Cables, Ltd., at £1,039. 1s. 3d., for high-tension cables; Messrs. E. Goossens, Pope, and Co., for 3,741 incandescent electric lamps.

Colchester.—The Council have accepted the following tenders: Henley Telegraph Works Company, Limited, cable, £1,635; Klein Engineering Company, water cooler and tray, £713; Davey, Paxman, and Co., condenser pipework, £116, and exhaust range, £225.

Engine Contracts.—We are informed that Messrs. W. H. Allen, Son, and Co., Bedford, have recently received the following orders: one 80-b.h.p. engine for Messrs. Pilkington Bros.; two 365-b.h.p. engines and two 150-b.h.p. engines for Londonderry; four 300-b.h.p. engines for Gibraltar dockyard; four 400-b.h.p. engines for Messrs. John Taylor and Sons for the Kola power station; and one 500-b.h.p. and one 270-b.h.p. engine for Rotherham.

Superheated Steam.—Messrs. Easton and Co., Limited, report that the Providence Engineering Works of Providence, Rhode Island, U.S.A., who hold a license under the Schmidt highly superheated steam patents for America, have within the last few weeks secured orders for complete steam engine plants as follows: one engine of 700 h.p., two engines aggregating together 1,800 h.p., and another of 1200 h.p., the order comprising in each case, in addition to the engines, Schmidt superheaters and receiver heaters.

London, E.—The Stepney Borough Council have received the following tenders for completing the electric light installation at the public library, Commercial-road East, Limehouse, E.:—

Barlow Bros., 237, Shaftesbury-avenue, W.C. (accepted)	£42	10	0
J. C. Christie, Mansell-street, E.	68	15	0
F. E. Emerson and Sons, Burdett-road, E.	52	0	0
Strode and Co., 48, Osnaburgh-street, N.W.	98	0	0
Tamplin and Makovski, Redhill	75	0	0
Ward Bros., 28A, Basinghall-street, E.C. (informal)	51	17	0

Maidenhead.—The Corporation have received the following tenders for extensions to the central station buildings:

W. E. Theaker, Maidenhead (accepted)	£874	0	0
Peerless, Dennis and Co., Eastbourne	1,242	0	0
Thompsett and Co., Farnham	1,221	0	0
W. J. Bloxham, Banbury	1,174	0	0
H. Flint, High Wycombe	1,127	12	6
C. W. Cox and Sons, Maidenhead	1,110	0	0
A. J. Colborne, Swindon	1,099	19	6
F. W. Edwards, Maidenhead	1,080	0	0
F. Bissley, Maidenhead	1,020	0	0

BUSINESS NOTES.

TRACTION.

Aberdeen.—The Ferry Hill tramway has been opened for traffic.

Swindon.—The Town Council have obtained sanction for a tramway loan of £36,000.

Eastbourne.—The Town Council have decided to institute a service of motor omnibuses.

Liverpool.—The Tramways Committee are looking out for a site for new tramway offices.

Lowestoft.—The formal opening of the new electric tramways has been fixed for the 18th inst.

Southampton.—The old Portswood tramway route will be opened for traffic in two or three weeks' time.

Liverpool.—The Electricity Committee have decided to apply for powers to supply Upton and Bidston with electricity.

Hull.—The tramway clauses in the omnibus Bill promoted by the Corporation have been passed by a committee of the House of Commons.

Colchester.—It is proposed to apply for an extension of time for three months in which to commence the construction of the electric tramways.

Paisley.—Extensions at the Blackhall electricity station are to be made to meet the demand for current for the tramways when they are constructed.

Doncaster.—A motion in favour of the abandonment of the proposed Oxford-street route was defeated at the last meeting of the Town Council.

Middlesex.—On Thursday last week the amount to be expended on light railways in Middlesex was brought up to £1,000,000 by a further vote by the County Council.

Wick and Lybster Light Railway.—The Wick and Lybster Railway was inspected on Friday by Major Druitt, of the Board of Trade. The formal opening took place on Wednesday.

Cardiff.—This week the Clive-street route was opened for traffic. It is anticipated that the Royal assent will not be given to the Bill to confirm the new tramway provisional order before next August.

Barcelona.—The committee appointed by the British Electric Tramways Company of Barcelona to enquire into the provisionally adjusted strike of their employés has arrived at Barcelona from London.

Salford.—The Council have resolved to make application to the Board of Trade for sanction to borrow £3,931 for the electrical equipment of the Prestwich Urban District Council tramways in Bury Old-road.

Digitized by Google

Gosport, Fareham, and Cosham Tramways.—The committee of the House of Lords presided over by Lord Hatherton has found the preamble of this Bill proved, particulars of which were given in our last issue.

Bradford.—The Drighlington section of the tramways system has been opened for traffic. The new line is nearly two miles in length, and the journey from the city to the Drighlington terminus is one of over 4½ miles.

Brighton.—A Select Committee of the House of Lords is enquiring into the provisions of the Corporation Tramways Bill, which asks for powers to extend the existing tramways in various directions. The enquiry will be resumed next week.

Dundee.—The agreement between the promoters of the proposed Dundee and Broughty Ferry tramways and the Broughty Ferry Town Council has now been signed. Arrangements have been made for pushing on the matter as rapidly as possible.

Rotherham.—The Tramways Committee recommend that the Board of Trade be asked to increase the speed limit to 12 miles an hour. The Tinsley section of the tramways is now completed and awaits inspection by the Board of Trade official.

Nelson.—The Electricity and Tramways Committee of the Corporation have further considered the question of the stages and fares on the Nelson and Barrowford tramways. The committee reaffirmed their previous decision with regard to the first ½d. stage.

Halifax.—The Hove Edge extension has been opened for traffic. The new line consists of a length of single track between Hipperholme and Hove Edge, and it is important as bringing the Halifax system within measurable distance of the centre of Brighouse.

Burnley.—The Accrington-road section of the tramways, the first of the branch routes, will be quite ready by the Burnley Fair holidays. The actual date of the visit of the inspector of the Board of Trade is not known, except that it will be between July 6 and 10.

West Bromwich.—The Highway Committee state that they have approved of 44 stopping places upon the electric tramways from the Handsworth boundary to Wednesbury and Dudley, which have been arranged with the South Staffordshire Tramway Company.

Bromley.—The British Electric Traction Company have given notice of their intention to apply to the Light Railway Commissioners for an order authorising the construction of light railways in the urban district of Bromley and the parishes of Farnborough and Chelsfield.

Baker-street and Waterloo Railway.—The Baker-street and Waterloo Railway (Extension of Time) Bill has been passed, as an unopposed measure, by Mr. Jeffreys, the deputy chairman of committees of the House of Commons. The Bill will be reported to the House for third reading.

Handsworth.—The District Council are still conferring with the Birmingham Corporation on the tramway question. It was stated at their last meeting that the Council were not tied to the British Electric Traction Company, otherwise they would not be open to confer with Birmingham.

Gloucester.—Tenders for the construction of the electric tramway system have been received, and will be presented to the next Council meeting. The work will probably be commenced six weeks after the signing of the contract, and the work will have to be finished in six months after it is initiated.

City and South London Railway Bill.—On Friday the Select Committee of the House of Lords of which Lord Belmore is the chairman concluded their enquiry into the provisions of this Bill, which were given in our last issue. The committee found the preamble proved, and the Bill will proceed.

Private Bills.—On Friday in the House of Lords the Baker-street and Waterloo Railway (Transfer) Bill was read a second time, and the Mid-Yorkshire Tramways Bill a third time. In the Commons the Harrow and Paddington Tramways Bill has been read a third time, and the Taff Vale Railway Bill a second time.

Reading.—Rapid progress is being made with the power-house which will supply current for running the tramways. Three of the four generating sets are delivered and the switchboard work is well in hand. The track itself is nearly completed and the last consignment of cars have been delivered by Messrs. Dick, Kerr, and Co.

Central London Railway.—This railway is now running a two minutes' service during the "rush" hours—that is, between 8 and 10 in the morning and 4 and 7 in the evening. Between Tottenham Court-road and Bond-street the company are experimenting with an automatic system of signalling, with a view to its adoption throughout the line.

Barrowford.—Two additional cars have arrived, making six in all, and when the tramway is completed it is proposed to run a seven-minutes' service, with five cars, during the week, and put the sixth on the lines during the week ends to facilitate a more frequent service. The new car-shed adjoining the present one is now almost completed.

Camberwell.—The Borough Council have approached the London County Council with a request for the construction of a tramway from the junction of the proposed line in Lordship-lane to the Crystal Palace, *via* Sydenham-hill. The Council have approved the underground conduit system for the tramways proposed to be constructed in the borough.

Hammersmith.—Subject to details being prepared, the Borough Council have decided to consent to the proposed tramway from Shepherd's Bush to the Marble Arch, and to make a contribution of one-third of the cost of the necessary street widenings not exceeding £9,260, provided that the tramway is extended either along Uxbridge-road to Bayswater or along Latymer-road.

Stepney.—The Borough Council have declared their intention of refusing to sanction the installation of the overhead trolley system in the streets under their control as proposed by the London County Council. On the other hand, they are ready to consent to the tramways which it is proposed to construct on the conduit system.

Llandudno and Colwyn Bay.—The order made by the Light Railway Commissioners extending the time for the completion of this railway has been confirmed by the Board of Trade, with the addition of the provision that the powers shall cease on Sept. 20 next unless the work is substantially commenced at that date. This date was fixed so that the district councils affected would (if the promoters failed to proceed) have sufficient time to prepare and lodge their own application for powers to construct electrical tramways.

Stretford.—A special meeting of the District Council has adopted a resolution authorising the necessary steps to be taken for an application to the Light Railway Commissioners for a provisional order under the Light Railways Act of 1896. This order, if granted, will authorise the Council to proceed with the construction of a light railway in the parishes of Stretford and Davyhulme, and will provide a through route between the Cock Hotel at Stretford and the proposed South Lancashire scheme. It will also afford a means of communication between Trafford Park and Stretford.

Dewsbury.—The work of connecting the Halifax-road and Heckmondwike trams is proceeding apace at Staincliffe. The track, which has been laid by Messrs Dick, Kerr, and Co., is now complete. It is hoped to run trial cars over the new line in about a week or 10 days, and the Board of Trade inspection will then follow immediately. An extension of the electric tramways in the Dewsbury district is being made by the construction of a line from the temporary terminus near Ravensthorpe (L. and Y.) railway station to the Fir Cottage estate at the Mirfield boundary.

Leeds.—The Leeds Tramways and Roundhay Park Committees have considered suggestions made by the general manager of the tramways (Mr. Hamilton) with the object of preventing the crushing which occurs at the Canal Gardens tram terminus at holiday times. The proposals are, in effect, the provision of sidings on the plot of ground opposite the Canal Gardens, so that, with the aid of queue gangways, passengers may quietly board their respective cars. The committees were impressed with the suggestions, which in due course will be carried out. It is proposed to considerably extend the ½d. fare system by way of experiment.

Gordon-Bennett Cup Race.—The Attorney-General, replying to Mr. Leamy in the House of Commons on Wednesday, said the Government had received no guarantee from the promoters of the Gordon-Bennett motor race in Ireland for the expenses of extra police over the sum of £1,000 which the Treasury was willing to contribute. Mr. Leamy: As the race comes off to-morrow, does the Government propose to levy any portion of the cost of the extra police on the county of Kildare? The Attorney-General: That matter is under consideration. As far as the race is concerned, all arrangements have been made, and 2,700 police will be there to assist.

Liverpool and Bootle.—Mr. E. C. Bellamy, general manager of the Liverpool tramways, gave evidence before the Select Committee of the House of Commons which is enquiring into the application of the Liverpool Corporation for the annexation of Bootle. He stated the difficulties which have arisen under the present arrangement in regard to the extension of the tramway system into the Bootle district, and showed the advantages that would accrue from the inclusion of Bootle within the city boundaries. He also referred to the scheme for the carriage of merchandise from the docks to South Lancashire towns, and outlined a scheme of tramways for Bootle.

Newport (Mon.).—The Caerleon-road section of the tramway system having been extended to the borough boundary, which is well over the hill beyond the Wesleyan Church at St. Julian's, was opened for passengers on Tuesday. The line, which constitutes the third artery for traffic to the suburbs, had been inspected by Major Druitt, on behalf of the Board of Trade, earlier in the day, and had been formally approved by him. There yet remain the Malpas-road and Stow-hill routes to be completed before the electrical traction of the borough is fully provided. Malpas-road is being provided with a double line, and will be shortly completed, but no start has yet been made with Stow-hill.

Additional Traffic Returns.—Angle-Argentine, £1,854 increase; Barcelona Ensanche y Gracia, £205 increase; Barcelona, £63 decrease; Brisbane, £93 decrease (month of May, £10,160, decrease £672); British Columbia Electric (month of March), gross earnings £10,352, net income £2,668; Buenos Ayres and Belgrano Electric, £814 increase (month of April, £12,995, increase £1,125); Calcutta, £350 increase; Cape Town (month of April), receipts £16,003, expenditure £8,313; Isle of Thanet Electric, £189 decrease; Mexico Electric (month of March), receipts £46,200, expenditure £26,400; Perth Electric, £43 increase; Port Elizabeth (month of April), receipts £4,292, expenditure, £2,281.

Elland.—At a meeting of the Urban District Council on Wednesday it was unanimously resolved to approach the Huddersfield Corporation and ask them to bring their tramcars to Elland Town Hall. Several of the members expressed dissatisfaction with the way in which Halifax had treated them in respect to tramways. It was pointed out that while on an average 3,000 passengers travel every week by rail between Elland and Halifax, only about 180 per week make the journey by train to Huddersfield. Although the latter is only four miles away by road, the railway fare is 8d. It was urged that if tramcars were run from Huddersfield much patronage would be diverted from Halifax to Huddersfield.

Bath.—It appears that there has been certain departures from the agreement entered into between the Bath Electric Tramways Company and the Somerset County Council. It was stated at the last meeting of the County Council that the county surveyor had done all in his

Digitized by Google

power to keep the company to the terms of the order, but he had signally failed. The company had entered upon the road without sufficient notice, and the second point, which was more serious, was that they had contravened the terms of their order that they should not break up more than 100 yards of road in every quarter of a mile throughout their district. It was decided to defer the question of liability until a survey has been completed.

Middlesbrough.—The Imperial Tramways Company have written to the Corporation with reference to the proposed tramway extension. The company are desirous of getting the plans ready for deposit in Parliament, and it is therefore necessary to get the route fixed without delay. The Town Clerk stated at the last meeting of the Council that Mr. Clifton Robinson was of the opinion that the cost of the bridge it would be necessary to construct would be £30,000, one-third of which should be paid by the local authorities, one-third by the railway company, and one-third by the tramways company. It was decided to have something a little more definite from Mr. Clifton Robinson before the Council took any action.

Giant's Causeway Electric Tramway.—The Ballymoney Rural District Council have passed the following resolution: "That the Board of Trade be requested to cause an enquiry to be made into the management of the Giant's Causeway and Portrush Tramway, inasmuch as six lives have been lost and two individuals have been maimed for life since the trams were introduced. Public opinion in the neighbourhood feels strongly that the rules laid down by the Board of Trade have not been complied with, and this Council, in the interests of those whom they represent, hereby call upon the Board of Trade to make an enquiry into the matter; and, further, that a committee be appointed to get up the facts for the enquiry, with power to employ the Council's solicitors."

South Lancashire.—The Bill promoted by the South Lancashire Tramways Company, which has passed the House of Lords, was before a committee of the House of Commons presided over by Mr. Bond on Tuesday. The only opponents were the Corporation of St. Helens. In the end an arrangement was arrived at by which the company are to have such running powers over the lines of the Corporation (now leased to a company) as are necessary to conduct a through communication of passengers, passengers' luggage, and small parcels, and the company are not to enter into agreements with the company working the St. Helens lines except so far as is necessary to give effect to the running powers. Any dispute on the matter is to be referred to the Board of Trade. The Bill as amended will be reported to the House for third reading.

Sunderland.—The borough electrical engineer, Mr. J. F. C. Snell, has presented alternative plans to his committee, one showing a double track with the exception of Lawrence-street, which is too narrow to permit of a double line, and another showing a single track with turn-outs. The double track would cost £12,000 and the single £9,000, and the committee decided to adopt the single track, to be laid in such a way that if in future a double track were necessary it would be possible to lay it for the additional £3,000. It was decided to use the Thermit system of welding in the construction of this section, and matters are to be put in hand at once so that immediately the Council approve the work can be commenced. The Board of Trade are considering the application of the Corporation to increase the speed limit on the tramways.

Embankment Tramways.—It seems that the defeat in the House of Commons of the County Council's proposal to run a tramway along the Embankment was due to the failure—in his constituents' opinion—of one member to do his obvious duty. The Lambeth councillors are exceedingly wroth about the matter and have fixed on the local M.P., Mr. Horner, as the scapegoat. He it was, they say, who supplied the one vote by which the scheme was thrown out. Not satisfied with having by resolution expressed their "regret" at the hon. member's action, the Council at their last meeting agreed to another motion that Mr. Horner should be informed that the explanation offered by him—that he was awaiting the result of the Royal Commission on London Locomotion—"in no way modified" the view already taken of his conduct.

Flintshire.—The railway companies whose lines run through North Wales are threatened with formidable opposition. It is reported that a powerful syndicate will next session of Parliament apply for powers to construct and work a system of electric tramways over a circular route, which will pass through Sandy Croft, Queen's Ferry, Connah's Quay, Flint, Bagillt, Holywell, Northop, Mold, Buckley, Hawarden, and back to Connah's Quay. There are large industrial populations in most of the centres, and along the coast of the Dee large works are being erected, and some thousands will be employed. The line will also serve several towns and villages which are a considerable distance from a railway station, and the opening out of the new route, while probably a cause of anxiety to the railway companies whom it will affect, will be hailed with satisfaction by the inhabitants of the district

Wolverhampton.—A special meeting of the Town Council was held on Monday to deal with matters relating to the borough tramways. It was moved and seconded that the minutes and proceedings of the Council in committee with regard to the Lorain system of tramways be adopted. The Town Clerk said it would be in the interests of the town that there should be no discussion on the subject, as the Tramways Committee had been instructed to seek an interview with the Lorain Steel Company in order to arrive at an amicable settlement of the dispute between the company and the Corporation. After further discussion the motion was adopted by 30 votes to 14. It was further resolved that the corporate seal be affixed to a memorial to the Board of Trade applying for the prolongation of the periods limited by Section 18 of the Tramways Act, 1870, for the commencement and completion of the works authorised by the Wolverhampton Corporation Tramways Order, 1902.

New Issue.—The South Staffordshire Tramways Company, which has a capital of £150,000, divided into 15,000 £5 ordinary shares and 15,000 6 per cent. cumulative £5 preference shares, of which 10,000 ordinary shares have been issued, and are fully paid up, announces the issue at par of 10,000 preference shares. The company was registered on July 31, 1899, to acquire a lease from the South Staffordshire Tramways Company of tramways of an approximate length of 23 miles. The population of the districts served, according to the last census, is 363 289, as follows: Walsall, 76,440; Darlaston, 15,381; Wednesbury, 26,544; Tipton, 30,543; West Bromwich, 65,172; Coseley (including Sedgley), 38,169; Dudley, 48,809; Handsworth, 52,921. The minimum subscription is the whole amount now offered, which has been underwritten by the British Electric Traction Company, Limited.

Bournemouth.—A special meeting of the County Council of Dorset is to be held "To receive a petition lodged by the Branksome Urban District Council in the House of Commons against Clause 11 of the Bill (being one of the agreed clauses in consideration of which the County Council withdrew their opposition), and which provides that the Bournemouth Corporation shall not accept a lease of or enter into a contract or agreement with respect to the working, etc., of tramways within the county (except in the borough of Poole) unless they obtain the consent of the County Council, which consent, however, is not to be unreasonably withheld; to receive a joint report of the County Works and Parliamentary Committees recommending the sealing and supporting before the House of Commons Committee of a petition against alterations; and, upon the adoption of the report, to pass a resolution authorising the seal of the Council to be affixed to the petition in question."

Railway Electrification.—The Court of Referees has adjudicated on a petition of the Corporation of the City of London to be heard against the Bill of the South-Eastern and London, Chatham, and Dover Railway Company, one of the objects of which is to provide for the ultimate electrification of the company's line. Mr. Pollock, the City Remembrancer, appeared for the Corporation to show cause why they should be allowed a *locus standi*. He said that when the railway was electrified—it might be six years hence—electric traction, "which was now only in its infancy," might have developed so that large engines might be in use, also strong electric currents, which might cause great injury by electrolysis to service works for which the Corporation was responsible. Damage might be done to gas and water pipes and mains, and to other service works. Mr. Clode (who appeared for the promoters) opposed the *locus* of the City, said there were no pipes or wires in the neighbourhood of the railway which could suffer from electrolysis, therefore the case was difficult to meet. The *locus* was disallowed.

South London Tramways.—Without ceremony, the London County Council have opened a new section of the tramways which they are electrifying south of the Thames. This is the line from Camberwell-green which formerly extended *via* Kennington Church and Harleyford-road to Vauxhall Station. For the present the section between the Oval Station and Vauxhall cannot be opened, as the road widenings are not complete, but there is a double line on the conduit system from Camberwell-green to Kennington, and by means of the loop at this point the cars can join the main line in Kennington Park-road and run on to Blackfriars, Westminster, and Waterloo. On Wednesday morning there was a further extension of the Council's tramway system. A number of cars of the lighter type, intended for use over the cable section between Kennington-gate and Streatham-hill, were put on, and ran with but very few hitches. These cars will, it is understood, be used between Camberwell-green and Westminster, as well as over the cable route to which they have been adapted. They are smaller than the standard cars, and carry 56 instead of 66 passengers.

Deptford.—The General Purposes Committee have had under consideration a letter from the clerk of the London County Council referring to the suggested widening of Lewisham High-road, Loampit Vale, and Lee High-road, in connection with a proposal to construct a tramway from New Cross to Lee Green. The estimated total net cost of the street widenings contemplated by the scheme is £149,300. Of this amount the estimated net cost of acquiring the necessary property in Deptford is put at £6,500, whilst the cost of executing the necessary paving works in Deptford, excluding the cost of laying and paving the tramway track, is estimated at £2,200. The estimated cost of the Lewisham portion of the scheme is £128,800 for property and £11,800 for paving works, the total net cost of the scheme therefore being £149,300. The committee recommend that so far as concerned the portion of the route within the borough the Council give its consent to the construction of the tramway and agree to contribute one-third of the net cost, such contribution not to exceed the sum of £2,900, of the necessary street widenings and paving works.

Scarborough.—Mr. A. A G. Malet, Local Government Board inspector, conducted a local enquiry on Saturday into the application of the Corporation for sanction to borrow £3,500 in respect of the repaving of Westborough and Newborough, leading from the railway station to the market hall, and the aquarium top between the Valley Park and the south foreshore. The borough engineer (Mr. H. W. Smith) stated that the work of laying the electric tramways would commence on Oct. 1, and the private company who had the control of the undertaking would keep in repair from then the ground occupied by the system, together with 18in. on each side of the rails. The Corporation had finally decided, with a view to ascertaining the extent of the increase of traffic which would be brought about by the trams, that a less expensive scheme than at first fixed upon should be carried out—viz., the use of wooden setts for paving. On the aquarium top this was especially advisable, as it would deaden the noise of traffic at present penetrating into the underground theatre. The chairman of the Streets Committee and the chairman of the Streets Sub-Committee particularised the proceedings of those bodies in the matter, the former

Digitized by Google

stating, in answer to the inspector, that the committee had not taken into consideration "wood-paving sore throat," which, Mr. Malet remarked, was becoming an evil of London streets. The inspector, after inspecting the thoroughfares in question, promised to report to his Board, who would intimate their decision in due course.

Pontypridd.—The consideration of the Pontypridd Tramways Bill by a Select Committee of the House of Commons presided over by Mr. Edward Bond was concluded on Monday. On the committee taking their seats the Chairman announced that the committee unanimously regarded the preamble as proved. Mr. Page, K.C., submitted a clause on behalf of the frontagers of Mill-street, whom he represented, providing that the proposed tramway should not be constructed unless and until the promoters should have satisfied the Board of Trade that the street was of sufficient width to allow of the working of the new tramways. The Chairman intimated that the committee could not introduce a proviso of that kind. Mr. Page next asked for a proviso stipulating that in working the tramway by this Act the Council or their lessees should not allow more than one tramcar or other vehicle used upon the tramway to be upon that portion of the tramway which would be situate between the junction of Mill-street and the proposed new street and Taff-street at any one time, and the Council or their lessees should for every breach of this enactment be liable to a penalty not exceeding £10. The Chairman said the committee thought it better to leave the protection of the inhabitants of Pontypridd to the joint action of the local authority and the Board of Trade. They thought that between the two authorities there would be sufficient protection. The clauses were then finally adjusted, and the Bill ordered to be reported for third meeting. A special meeting of the District Council has decided to apply to the Board of Trade for authority to give notice to the owners (the British Electric Traction Company) of the Pontypridd and Rhondda Valley horse tramways of their intention to purchase so much of the undertaking as is in the urban district.

London County Council.—Replying to a number of questions at Tuesday's meeting of the London County Council, Mr. J. W. Benn, chairman of the Highways Committee, referred to Lord Avebury's criticisms of the Council's tramway undertaking before the Industrial Freedom League, and said he was waiting for some responsible member of the Council to get up in the Council to say the things that Lord Avebury was saying to the league. He would then be happy to reply to him, or even to bring up a report upon the statements. Electric traction had not reduced the number of men employed to work the cars. The number of men employed under the old system was 547, and under the present 603. Horsekeepers, farriers, and workers in the granaries had been discharged, but many of them were found employment. Of the 154 men who had been discharged, 52 of the oldest servants had been re-engaged. It was not true that at the Penrose-street depôt they refused to engage a man over 35 years of age. The Improvements Committee submitted for approval a proposal for the execution of certain street widenings in South London in connection with a scheme for the construction of a new tramway from Camberwell-green to Lordship-lane. The thoroughfares proposed to be widened in certain parts are Denmark-hill, Champion-park, Grove-lane, Dog Kennel-hill, Grove-vale, and Lordship-lane. The gross cost of the improvement is estimated at £119,900, of which £78,900 represents the cost of acquiring property, and £41,000 the cost of the necessary paving and other works. The Camberwell Borough Council has consented to contribute one-third of the cost of the improvement within their district, but the Lambeth Borough Council has declined to adopt a similar course with regard to the portion of the improvement within their borough. It is accordingly proposed with regard to the improvements in Lambeth to charge one-half the cost to the improvement and the other half to the tramways account. The Finance Committee contend that the outlay in Lambeth could only be justified as tramway expenditure, and that the whole cost of the improvement should be charged to the tramways account.

Londonderry.—A report dealing with the tramway services was present at the last meeting of the Town Council, stating that in the report of Sir William Preece, adopted by the Council, it was stated that the additional cost of making arrangements to supply power to tramways, including the special feeder, did not exceed £1,000, and that the amount was included in his estimate. It would be of great service to the citizens if an extended system of tramway services at 1d. fares could be established in the city. Electric tramways would furnish considerable revenue for the power of which the Corporation had now a monopoly. Waterloo-place would make a convenient centre for the starting of the tramcars on the city side, and the Northern Counties Railway terminus would make a convenient centre for the starting of tramcars at Waterside. On the city side a line might be laid from Waterloo-place by the Strand-road, as far as Duncreggan-road, and from that point up Duncreggan-road, along Lone Moor-road to the junction with Lecky-road; one line returning to Waterloo-place by Lecky-road, Rossville-street, William-street, and another line returning to Waterloo-place by Bishop-street, Abercorn-road, John-street, Foyle-street, and Shipquay-place. There might also be from the Strand-road a line up Great James-street to the Brooke Park gate. From the Northern Counties Station trams could be run to the end of the bridge, round Spencer-road, along Clooney-terrace, and out Clooney-road as far as the city boundary extended, and back by Bond's-hill to the starting point. All these services could be managed, by means of places for passing, so that the cars could run in both directions. The citizens would be fairly well served with these lines within the borough, but the Council should, in the near future, endeavour to extend the tram services as far as Culmore, and Gallagh on the Donegal side of the river, and Enagh Lough and the Cross on the county Derry side. Such extensions of the tramway service, besides bringing traffic to the city, would enable the citizens to speedily reach the country, thus doing away to a large extent with the necessity for open spaces and park accommodation. It would have the further advantage of making the city spread and enabling the citizens to have their residences away from the centre of the traffic, while at the same time providing a speedy means of reaching their business. The question of whether a company should be allowed to take up the tramway services on terms to fixed by the Corporation or should the Corporation undertake the municipalisation of tramways should be discussed as soon as convenient, and it must be remembered that if Londonderry was to keep pace with the times, and if its property was not to be allowed to fall into decay, an extended tramway service at cheap fares was essential.

Birmingham.—At a meeting of the City Council to be held on July 7 a report will be presented by the Tramways Committee. The committee, in the first place, report concerning the steps to be taken by the Corporation to exercise its compulsory powers of purchase in respect of the tramway lines now owned by the City of Birmingham Tramway Company in Balsall Heath. The committee state that notice requiring the company to sell may be given within six months from July 12, and if not so given the power of purchase cannot be exercised for another seven years. The committee, therefore, recommend that the Council should pass the requisite resolutions under the Tramways Act, 1870, deciding to give notice to the company requiring them to sell to the Corporation so much of their respective undertakings under the said tramway orders as may be within the city, and that the committee should be instructed to take all such steps as they may consider requisite or desirable with respect to such notices, and to any arbitrations or other proceedings thereunder. The committee next report the correspondence which recently took place with the Aston Manor authorities, and also the proceedings successfully taken to defeat the application for compulsory running powers sought for in the Birmingham and District Tramways Bill. In this connection the committee placed on record the following passage from the speech on behalf of the Corporation of Mr. Balfour Browne: "I pledge myself to two things, and I will put in gentlemen from the Corporation of Birmingham who will pledge themselves, who will say that they are prepared, either at once or before the termination of the lease, to make all reasonable arrangements for the carriage of traffic where necessary into Birmingham without any change of car. I also ask them to pledge themselves to this—that they will, at the very earliest opportunity, as they intend to, equip those lines for electric traction, so that cars may be running continuously from the country round Birmingham into Birmingham and from Birmingham out into the country round." These pledges were confirmed by Mr. Alderman Beale and Mr. Alderman Cook in their evidence. The committee then report as follows regarding the appointment of a tramway manager: "In the opinion of your committee it is most desirable, having regard to the magnitude of the interests involved, to the arrangements which have to be made almost immediately for the working of the Aston tramways, and to the many questions constantly arising on which the advice of an experienced tramway manager is necessary, that such a person should be appointed forthwith. They find a difficulty, however, in asking the Council to fix the salary of such an appointment, as the persons possessing the requisite experience are few, and in all probability would not apply for the situation if advertised. Your committee are of opinion that the best way of securing the most efficient person would be for them to be authorised to make enquiries and, if they think requisite, to advertise for a manager, and to appoint the person they deem best qualified at such salary as they may, under all the circumstances, consider reasonable, having regard to the salaries paid for similar services in other large towns. The proximity of the autumn vacation and the desirability of avoiding delay obliges them to ask for this unusually wide discretion." No definite arrangement has yet been made for convening a conference of the Tramways Committee of the City Council and the representatives of the local authorities with the object of arriving at an agreement respecting the future working of the tramways in Birmingham and the outlying districts. It is believed, however, that the Tramways Committee will have an interview with the representatives of some of the neighbouring authorities next week.

LIGHTING AND GENERAL.

Aldridge.—The telephone exchange was opened on Monday.

Limerick.—The electric street-lighting was successfully inaugurated on Friday last.

Woolwich.—The Borough Council have fixed 4d. per unit as a general rate for the supply of current.

Gillingham.—The laying of a number of additional mains has been agreed to by the Urban District Council.

Lancaster.—The Town Council have obtained sanction to the borrowing of £225 for electric lighting purposes.

East Barnet Valley.—The Urban District Council have decided to obtain advice on the question of electric lighting for the district.

Mansfield.—The Electricity Committee have taken over the station as from June 24. The current was supplied gratis up to that date.

Wirksworth.—The district manager of the National Telephone Company has visited the town, and there is a prospect of a line being laid shortly.

Tonbridge.—The Guardians have asked the Tunbridge Wells Corporation to send an estimate of the possible supply of electric light to the workhouse.

Rotherham.—Another request is to be made to the National Telephone Company to provide better telephonic communication between Rotherham and Sheffield.

Slough.—The Urban District Council are in a quandary as to whether they may legally pay for goodwill in the event of purchasing their electric lighting order from the Slough and Datchet Electric Supply Company.

Digitized by Google

Croydon.—The Council have approved a draft agreement with the London, Brighton, and South Coast Railway Company with reference to the passing of electric cables under the company's railway from Cornwall-road to Lower Church-street.

Northfleet.—The Board of Trade have decided to defer consideration of the question of revoking the Council's electric lighting order for one year from the 2nd inst. The Kent Electric Power Syndicate's engineer is to meet the Council on July 7.

Charing Cross and Strand Electricity Supply Corporation. Warrants for the dividend on the City undertaking 4½ per cent. preference shares, and for the interest on the 4 per cent. debenture stock of this Corporation, were posted on June 30.

Bedford.—A further loan of £6,960 has been obtained by the Corporation for the electric light works. Over £2,000 will be spent on a steam alternator, £1,556 for water-tube boiler, and the balance for extensions, cables, and house connections.

City of London Electric Lighting Co.—The following dividends on account have been declared: on the preference shares, Nos. 1 to 40,000, 6s. per share; on the ordinary shares, Nos. 40,001 to 110,595, 5s. per share. Warrants for the above interim dividends, less income tax, will be posted on July 14.

Whitehaven.—The Guardians have decided that both the infirmary and the workhouse be lighted with electricity instead of gas, and that an arrangement be made with the Corporation of Whitehaven to supply electricity at the rate of 6d. per unit, subject to the sanction of the Local Government Board.

Stockton.—The two electric motors which have been installed at a cost of £365 at the Corporation quay to drive the elevator hoists and other machinery in the transit shed and grain warehouse were formally started on Friday morning last by Councillor F. Raines, chairman of the Quay Committee.

Metropolitan Asylums Board.—The Managers have adopted a proposal from the County of Surrey Electrical Power Distribution Company to supply current to the Southern Hospital at the rate of 3d. per unit. It will be necessary to provide a small sub-station to contain the distributing apparatus.

Hammersmith.—The last report of the Electricity and Lighting Committee states that 13 additional consumers have been connected, representing a maximum of 298 8-c.p. lamps; that nine consumers have been disconnected; and that the total number of consumers now taking current from the mains is 1,268.

Malton.—The Urban District Council, after considering a letter and report from the Northern Counties Electric Supply Company, have decided to ask the Board of Trade to direct the company to carry out the terms of the order granted them within a reasonable time, or otherwise to revoke the order.

New Book.—Messrs. Whittaker and Co. will shortly publish "Whittaker's Electrical Engineers' Pocket-Book," edited by Kenelm Edgcumbe. The sections in this volume have been written by experts, and will contain information which will meet the requirements of the various branches of electrical engineering.

Huddersfield.—The borough electrical engineer's last report gives the following figures: number of consumers—June 1,785, May 1,768, increase 17; lamps connected—June 123,821, May 123,172, increase 648; units metered—May 125,275, corresponding period last year 69,709, increase 55,566, equals 79 per cent.

Halifax.—Major C. E. Norton has held an enquiry into the Corporation's application for sanction to borrow £20,000 for the extension of their electric light undertaking and £3,970 for street improvement. Mr. W. M. Rogerson, the electrical engineer, explained that the £20,000 required for his department was principally for mains.

Dublin.—In response to an appeal issued by Trinity College for assistance to build and equip laboratories and lecture rooms for physical science, electrical and technical engineering, botany, and zoology, Lord Iveagh proposes to provide a capital sum of £30,000 as soon as a sufficient amount has been raised to produce an annual outlay of £2,730 per annum.

Willesden Polytechnic Electrical Engineering Society.—On Thursday last the society visited the private electric lighting installation of Messrs. C. M. Martin and Co., Limited, at Stoke Newington. The arrangement of engines and dynamos and the special methods of switching proved of great interest to the members, and the visit proved in every way a most instructive one.

Coventry.—Mr. J. A. Jeckell, the manager of the Corporation electricity works, was congratulated at Tuesday's meeting of the City Council on the improved position of the undertaking. It was explained that the charge upon the rates this year was only £189, whereas it has usually amounted to about £1,700 per annum. The improved result had been brought about largely by economies effected at the works.

Wimbledon.—The financial statement of the electric light undertaking for the year ended March 31, 1903, shows that after providing for repayment of principal and interest, and putting £500 to reserve, there is a sum of £1,527 to be applied to the reduction of the rates. In the first year there was a loss of £250, in the second £1,040, and since then the balances have been on the right side—namely, £134 in 1901, £1,357 in 1902, and now £1,527 as stated.

Leeds.—The revenue of the electric department of the City Council for the financial year ending March 25 was £231,734, as compared with £178,422 in 1901-2, showing an increase of £53,312. To this increase light contributed £34,537 and power £18,775. The average price obtained per unit was 3·02d. in 1902-3, as compared with 3·56d. in 1901-2. The total expenses per unit (including interest and sinking fund) were 2·95d. per unit, as compared with 3·31d. in 1901-2.

Sale of Business.—Messrs. Moores, Farrell, and Co., Mynshulls House, Victoria-street, Manchester, have purchased the goodwill of the business of electrical engineers heretofore carried on by Messrs. Wilson and Orr at Ellesmere Electric Works, 46, Ellesmere-street, Cornbrook, Manchester. They have engaged Mr. Wilson to act as manager of the works, where they will manufacture switchboards, switches, fuse boards, watertight fittings, and general electrical accessories.

Aston.—The electrical generating station, which was commenced a little more than a year ago, is rapidly approaching completion. The total cost, with the expense of the cables, has been £65,000. The plant consists of two 500-kw. engines, one 250-kw. engine, and six boilers. The latter are fitted with mechanical stokers. Up to the present about 10 miles of cables have been laid for lighting purposes. The date of the formal opening of the generating station has not yet been fixed.

Stourport.—The Shropshire and Worcestershire Electric Power Company, who have acquired a site for a station in the district, intend to apply for a provisional order to supply electricity in the Council's district. They have informed the Urban District Council that they did not wish to be hostile to the Council, and if the Council wished to obtain an order themselves they would be willing to supply electricity in bulk to them. The matter is before the General Purposes Committee.

Headlights.—It is reported that the Canadian Pacific Railway has equipped 100 engines with a new type of electric headlight, and very shortly all passenger engines will be similarly equipped. The lamp, in addition to sending a powerful ray along the track in front of the engine, also projects a powerful vertical beam. The latter makes a very decided illumination in the sky, whereby it is possible to detect the presence of an engine, follow its path, and determine which way it is heading.

Swansea.—In an analysis of the second year's accounts, and already noted by us, Mr. Prussman (electrical engineer) states that the total cost per unit works out this year at 1·48d. as against 1·72d. last year, or a decrease this year of 0·24d. per unit. The works costs work out at 1·06d. per unit, as against 1·02d. per unit last year. All items in the works costs show a decrease except those of wages and materials on repairs, maintenance of buildings, plant, instruments, etc., and those of public lamps.

Stock Exchange Settlements.—The Stock Exchange Committee have ordered Primitiva Gas and Electric Lighting Company of Buenos Ayres, Limited, further issue of £25,000 4 per cent. first debentures of £100 each, Nos. 5,251 to 5,500, to be quoted in the official list. Application has been made to the committee to appoint a special settling day in and to grant a quotation to County of London and Brush Provincial Electric Lighting Company, Limited, £250,000 4½ per cent. second debenture stock.

Larne.—The Urban District Council have asked the Larne Electric Light Company to reduce their last prices under which they offer to supply current for public lighting. For lighting the incandescent lamps only in the evening the company tendered £399. 13s.; for morning lighting of the incandescent lamps the tender was £43. In the tender the total for morning and evening lighting of the incandescent lamps was £442. 13s., or an increase of £75. 3s. The total cost of the arc lamps was to be £173. 10s.

Barnstaple.—Application is to be made to the Local Government Board for the balance of £27,000 lighting loan previously asked for. The Town Council have agreed that on receipt of the specifications for lighting the music hall from Mr. Trentham, if the specifications are adopted, and if it is decided to light the hall with electricity, tenders for the work should be invited. The Mayor, with Messrs. Brown, Richards, Lindsley, and Andrew, have been appointed a committee to consider a new system of keeping the electric lighting accounts, and report to the Council.

Battersea.—The electrical engineer estimates that the cost of providing the necessary fittings for the whole of the houses on the Latchmere estate, including the 16 houses to be erected on the west side of Matthews-street, will be £1,920. 12s. 6d. Up to the present time the whole of the 79 applicants for the tenancy of the houses desire to use the electric light. Arrangements are to be made for the work of providing electric light fittings in the houses where required, to be proceeded with as soon as possible in accordance with the estimate prepared by the electrical engineer.

Islington.—The Lighting Committee have reported to the Council with reference to the reported intention of the Holloway Electric Supply Company to supply the new Marlborough Theatre by means of overhead wires crossing Holloway-road, that they were not aware that the said company had any statutory powers to supply electricity within the Council's area. Without such powers, to do so would be illegal, while the proposed overhead wires would be contrary to the Overhead Wires Act. In consequence the London County Council will be informed the Council strongly oppose the project.

Wallasey.—The Electricity Committee have decided to alter their charges for electric current from 5d. to 6d. per unit, subject to a reduction of 2d. instead of 3d. per unit for all supply above two units per quarter for each 8-c.p. lamp, while 16-c.p. lamps must consume four units per quarter before the reduction of 2d. comes into effect. For meter rentals the reductions are as follows: for 1 to 15 lamps of 30 watts (8-c.p.) each from 2s. to 1s. 4d. per quarter, 16 to 30 lamps 2s. 3d. to 1s. 6d., 31 to 75 lamps 3s. 3d. to 2s. 2d., 76 to 150 lamps 5s. to 3s. 9d., 151 to 200 lamps 7s. 6d. to 5s. 8d., 201 to 300 lamps 11s. to 8s. 3d.

Potchefstroom (South Africa).—There is considerable interest being manifested by the ratepayers of Potchefstroom in regard to the lighting of the town. Offers to do this had been received from Johannesburg firms, but the matter was adjourned *sine die*. The ratepayers, however, have expressed themselves as dissatisfied with this, and several prominent traders have ordered complete plants of

Digitized by Google

their own. The Health Board have, as a result, brought up the matter again, and will consider the advisability of granting a concession for lighting the whole town and military cantonment.—*South African Exports.*

Croydon.—The electric lighting plant at the lunatic asylum just erected by the Corporation at Chelsham consists of two of Messrs. Belliss's non-condensing engines, dynamos, and booster set, laid down by Messrs. Mavor and Coulson, of Glasgow. The storage battery was supplied by the Chloride Electrical Storage Company, of Manchester, and the switchboard by Messrs. Frank Suter and Co., of London. The wiring was executed by Messrs. Wenham and Waters, Limited, of Croydon, and the total cost of the electric lighting arrangements was £6,000, the total cost of the asylum being close on £225,000. Mr. E. G. Rivers, A.M.I.C.E., acted as consulting electrical engineer.

Ripon.—At the last meeting of the City Council a letter was read from the Board of Trade pointing out that the Ripon Electric Lighting Order, 1901, did not contain any provision enabling the Corporation to transfer the undertaking to a company. The period within which the compulsory works specified in the order should be completed would not expire until July 26, and the order would remain in force until it was revoked by the Board of Trade. If the Corporation were able to satisfy the Department that they intended to take steps to carry out the compulsory works at an early date, the Board would be prepared to consider whether the revocation of the order might be postponed for a period.

Electric Cranes.—Official trials were made last week of the two new electric cranes which have just been installed by the Dover Harbour Board. These cranes, the equipment of which has cost £11,000, are exceptionally large and powerful, and have been constructed to the design of Sir William Preece and Messrs. Siemens. They are built so as to command both sides of the Admiralty Pier, and are to be used for the transhipment of mails and baggage in specially-built crates capable of containing 2½ tons. Under the new system, which came into operation on July 1, the usual Custom House delay will be saved, as the crates will be loaded up in London and Paris and carried straight through to either capital. Electrical cranes have also been erected at Calais, and the mail steamers have been specially altered for the shipping of the crates.

Oldham.—The new Corporation electricity station at Greenhill, Oldham, was opened last week by Mr. Alderman Harrop (chairman of the Electricity Committee). This new station was required owing to the increasing demands made upon the Rhodes Bank station for current, both for lighting and traction purposes. The engine-room, when full, will accommodate plant of 10,800 h.p. The present instalment gives 6,000 h.p., and 4,800 h.p. can be added without additional buildings; when required, it is proposed to add a third bay to the engine-room to contain four 2,500-h.p. sets. If the buildings are extended according to the present proposals the total capacity of the complete station will be approximately 20,000 h.p. When full, the boiler-house will contain 16 dry-back marine boilers and four vertical "Climax" boilers. The estimated cost of the station is about £156,000.

Launceston (Tas.).—We understand that the contract for the reconstruction of the electric light and power transmission plant for Launceston, Tasmania, has been placed with Messrs. Witting, Eborall, and Co., Limited, of Temple Bar House, London, E.C. This contract comprises the supply of four Francis type turbines of 445 b.h.p. each, these turbines being direct coupled to 300-kw. three-phase generators giving a terminal pressure of 5,000 volts; also high and low tension switchboards in generating station and sub-station, together with separately driven exciters, motors, transformers, and material for the overhead transmission line. The plant previously in use consisted of 100-kw. single-phase alternators giving 2,000 volts. The reconstruction of the present plant is being carried out by Messrs. Witting, Eborall, and Co., Limited, of Temple Bar House, to the specification of the Launceston city electrical engineer, Mr. William Corin.

Tipton.—At the last meeting of the District Council, Mr. Foster (solicitor) made a lengthy statement in reference to the dispute which had taken place between the Council and the Midland Electric Corporation in reference to the supply of electricity for lighting purposes. He remarked that there had been a prospect of costly litigation, but efforts had been made to find a *modus vivendi* between the Council and the Electric Corporation, with a result which he thought was very satisfactory. Under the terms of the new agreement, the Electric Corporation would pay to the Council a lump sum of something like £600, the whole of the costs incurred during the last three years, including those in connection with the promotion of the provisional order, the Board of Trade enquiry, and the preparation of the agreement. The Electric Corporation would pay to the Council £50 for the ensuing year, £150 per annum for the next two years, and £200 for the remainder of the 21 years; also 30s. per week for a meter inspector. A resolution approving of the seal of the Council being attached to the agreement was adopted.

Private Bills in Parliament.—Sir Robert Gunter's Select Committee on Wednesday gave their decision on the Walton-on-Thames and Warmley provisional orders. In each case the Urban District Councils were seeking confirmation of Board of Trade orders to supply electricity for lighting purposes within their districts, and they were opposed by the local gas companies, who objected, as contributories to the rates, to being called upon to contribute towards any loss which might arise from a form of competition directed against themselves. Mr. Balfour Browne, K.C., and Mr. Paddon each asked, on behalf of the gas companies, that a clause should be inserted to the effect that after the first year's working the undertakers should have a proper balance-sheet laid before them, and they should then fix such a charge (up to the maximum allowed by the Board of Trade) to consumers so that, as far as possible, the revenue of the year should balance the expenditure. After consultation, the committee passed the preamble of the Bill, and inserted a modified provision to the effect that such a balance-sheet should be made out after the first three years' trading, and that then the charges should be adjusted.

The Clifton-Oaksford Reproducer.—Last Friday we had the opportunity of witnessing an invention by Mr. Bert Oaksford, Peveril Drive, Nottingham, which will revolutionise the gramophone market. The improvement centres mainly in the flexible arm which carries a small sound-box, and which is pressed on the cylinder. This allows the stylus to follow the impression of the sound-waves, both vertically and with a rocking kind of movement. As a consequence, the bass notes, which are represented by the top of the wave curve, come out in their full value. The stylus is enabled to get clear of the vibration without shock and without tearing through it, and as soon as one vibration has passed, the sound-box springs back to meet the next. At Friday's demonstration two instruments were used, one of which only was fitted with Mr. Oaksford's invention, and the difference between that and the ordinary gramophone was most marked. There was a total absence of the usual tinny, squeaky sounds, and the full harmony of both vocal and instrumental music was reproduced to its fullest extent. In fact, it was quite pleasant to listen to the instrument even standing close to the receiver, which is saying a great deal.

Portsmouth.—On Friday, the King's birthday, the municipal telephone system was generally inaugurated by the Mayor (Sir W. T. Dupree), who subsequently entertained a company of about 100 to a sumptuous banquet in his apartments in the town hall. During the evening congratulatory messages were telephoned by Bailie Alexander, chairman of the Glasgow Telephone Committee, from Bournemouth and Brighton, and from the various councils of the districts served by Portsmouth. The installation was decided upon in 1900, and the construction took place in the summer and winter of 1902. Customers were speaking in October last, and already the committee finds itself unable to join up more subscribers, as the original estimate of £25,500 for 1,240 lines has been exhausted. Considerably more than originally planned, 1,000 lines have been connected up in the borough and over 150 in the surrounding district, which is served by aerial lines, while in the town the circuits are underground in cable, and distributed by overhead wires—24 to 36 on a pole. The Town Council has already authorised the Telephone Committee to borrow an additional £12,000 to raise the number of lines on the exchange to 2,000, and the actual work of extension is already in hand. The charges are £5. 17s. 6d. a year (unlimited use), £3. 10s. and ½d. toll, £2. 10s. and 1d. toll. Last month the profit was about £80 after all expenses had been met, and with an increasing income from tolls better results are confidently anticipated.

Colchester.—Application is to be made for sanction for the borrowing of the following amounts, in addition to the loan of £7,000 for which application has already been made—viz.: main extension, Lexden Village, £123; ditto, Butt-road, £70; ditto, Meyrick-crescent, £50; rewinding armature of H.B. 27-40 dynamo for traction purposes, £110; additional lifting gear, £60; contingencies, £17. 5s.—total, £430. 5s. The following statistics were contained in Mr. Sillar's last report: output of electricity in units during May, 1903, 17,825; number of consumers at end of May, 358; total number of 8-c.p. lamps connected, 22,732. The committee have reported consideration of two alternative schemes for extending the electric light mains to North-hill, North Station-road, and Bergholt-road. The scheme upon which they had decided provided for a feeder of sufficient size to supply 3,600 lamps; this would be continued to a point 1,900 yards from the electricity works, and would be linked to the network at the North Station railway bridge. Arrangements would be made for connecting a main in Myland-road when it should be laid, and for carrying a distributor for a distance of 1,150 yards up the Bergholt-road. The cost of the scheme would be £1,863, and the committee had resolved to defray this out of the £2,750 for main extensions in the loan of £8,500. The committee added "they were satisfied that the probable revenue to be derived will justify the expenditure."

Uganda.—A Reuter's telegram from Mengo dated April 28 says the extension of the telegraph system has been pushed on rapidly during the last six months, and now the line is open to Butiaba, on the shore of the Albert Nyanza. A branch line has been built to a place called Masinde, in Unyoro, a distance of some 50 miles from the main line. On all these extensions there is no extra charge, thus the mileage open for traffic now in Uganda is as follows: Mombasa to Port Florence, on the Victoria Lake, 584 miles; Port Florence to Kampala and Mengo, temporary line, 200 miles; Kampala to Entebbe, 25 miles; Entebbe to Albert Nyanza, 175 miles; Hoima, Unyoro, to Masinde, 50 miles—total, 1,034 miles. The charge over the whole of this distance is 2d. a word, with a minimum of 1s. 4d. for a message of eight words. There is also a system of telephones along the whole distance, so that traders and travellers may use the line when necessary at the charge of 1s. 4d. per conversation. These telegraph lines are called "temporary," but as they are constructed of bark cloth tree (a species of fig tree), and as these have extrordinary powers of germination, all the telegraph poles are now living trees, and should be almost equal in point of duration to iron poles, as the fig tree is a long liver. It is a novel sight to the traveller to see a line of telegraph poles in full blossom. Mr. H. W. Tyler is the person responsible for this great activity in the telegraph extension, and the Government have recently given him a permanent appointment on the staff of the Proctectorate as assistant superintendent.

Gravesend.—The resident engineer has prepared the following report on the question of supply to workmen's cars. He states it will be necessary to run one of the large generating sets to give current for this purpose. This will prove most uneconomical, and result in a loss instead of being profitable. There are three ways in which this could be avoided: (1) By installing a traction battery, a course under present circumstances he should not recommend. (2) By purchasing a small set, about 25 kw., sufficiently large to undertake the supply of lighting

Digitized by Google

during the early morning, leaving the present battery to supply the trams. The cost of this set would be about £500. This method should be the cheapest way out of the difficulty, but there is always the possibility that the lighting load during those hours may grow beyond the capacity of such a set. (3) Purchasing a set about 80 kw. to 100 kw. at a cost of, say, £1,250, which would run the traction load from 5 a.m. until about mid-day. This set also run in parallel with one of the large generators would give the tramway company all the current they are at present entitled to. At present two large sets are run in parallel at week ends, and the load is such that both sets are working uneconomically. He is of opinion that this would be the most satisfactory method to adopt, having consideration to the future working of the undertaking as well as the present used. The electric lighting of the technical school is under consideration, also plans of a scheme for automatically fitting coal store and delivering from store to boilers. It is proposed that application be made to borrow the following amounts: Babcock and Wilcox, work on temporary shaft and circulating pipes, £409; Western Electric Company, Limited, additional tramway feeder, £533. 5s. 11d.; pilot wires, £66. 3s. 11d.; general mains, extras, £470. 10s. 2d.—£1,479.

Burnley.—The Electricity Committee have resolved that, subject to the approval of the Council, a new engine and dynamo, of 250 kw. capacity, be purchased and erected at the electricity station at an estimated cost of £4,000, and that new generator panels be added to the traction switchboard at an estimated cost of £105, and that the Council be recommended to instruct the town clerk to apply to the Local Government Board for sanction to the borrowing of £9,606. 7s. 8d., made up as follows: extension of buildings, £198; machinery, £8,790. 8s. 8d.; and main (Trafalgar-street), £617. 9s. The proposed new 250-kw. set is required in order to meet the increased demands for electrical power. The maximum demand for lighting during last winter (1902-3) was 413 kw.; it is practically certain that next winter the maximum will rise to 460 kw., and during each of the two following winters a like rise of 50 kw. may be expected. To meet this demand, the present machinery can give a maximum lighting output of 680 kw., allowing no margin for "stand-by." None of 1, 4, and 5 generators are now available for the production of power for traction, but it is proposed, by adding generator panels to the traction switchboard, to make No. 1 generator available for either lighting or traction. If the demand for energy for lighting purposes rises, as anticipated, to 560 kw. during the next three years, there will be barely sufficient power to meet that demand with No. 1 generator in reserve for both lighting and traction. The Tramways Committee have informed the electricity department that power should be provided for the running of 46 cars on the main and branch tramways. The committee reckon a less consumption of power than 15 kw. per car, therefore the department should be able to meet a traction demand of 660 kw. The present plant will give a maximum output for traction purposes of 500 kw., without any stand-by margin. This is clearly insufficient. This plant capacity may be increased, as already stated, by making No. 1 generator available for traction as well as lighting, but even if this be done the maximum traction capacity will amount to 600 kw. only, with nothing in reserve, and it must be remembered that the lighting reserve of 100 kw. is absorbed also.

Londonderry.—The Private Electric Light and Power Committee have received a report on electric motive power, free wiring, etc., in the city. The report on electric motive power stated that each brake horse-power supplied continuously for 50 hours per week and 50 weeks per annum would consume 2,000 units, which at 3d. per unit would cost £25. This price would be charged on the assumption that the full power was used continuously throughout the whole time, whereas there was practically not a single instance in connection with any industry requiring power where such conditions were fulfilled. It was reasonable to assume the motors connected in Londonderry would be working under somewhat similar conditions to those elsewhere when the cost per annum of 50 weeks at 50 hours per week at the rate proposed would be 1 b.h.p., £8. 6s. 8d.; 5 b.h.p., £41. 15s. 4d.; and 10 b.h.p., £83. 6s. 8d. The cost per annum for all sizes of motors would be in proportion. With regard to free wiring, the term was intended to convey that the wiring was carried out free of all initial cost, a rental being made instead. Such a system should certainly be arranged in Londonderry to encourage those who were reluctant to provide the necessary capital. In many towns companies had carried out the work, and their method of securing the interest on their capital expended and profit in each installation was based on the actual number of units of electricity consumed, a certain rate averaging 1d. per unit being made for the use of the wiring and fittings. Where the electrical supply, as in Londonderry, was in the hands of the Corporation, it was responsible for the collection of the free-wiring rent, and handing it over to the company. Such a system of charging was exceedingly simple, but was not on a fair basis, as the long-hour consumer, who was the most desirable class of customer, was charged a higher rate of rental for his wires and fittings than his less profitable neighbour. The average cost of wiring a 16-c.p. lamp was £1. But it is proposed that the rental of wiring and fitting should not be base on the number of units, but on the number of lamps, or on the capital expended under a buying-out system, whereby the rate should include interest on capital plus the amount necessary to repay the capital over a short term of years, when the wire and fittings would become the property of the consumer. Over a term of five years the annual rental per lamp installed would amount to 4s. 8d., which allowed for the repayment of principal with interest. The reports are to be printed and considered at the next meeting of the Council.

St. Marylebone.—The Electric Supply Committee reported at the last meeting that the London County Council had resolved not to grant the application made by the Borough Council for sanction to the borrowing of the amount required for the purchase of the electricity undertaking under the terms of the umpire's award without further statutory authority being given to the Borough Council authorising it to borrow for electric lighting purposes. Mr. Asquith had said that if "the County Council proves to be unable or unwilling to assent, I think the Borough Council should apply for a license, under Section 2 of the Act, to the Board of Trade, which, under the very exceptional circumstances of the case, would probably be disposed to grant the application." Mr. Fletcher Moulton advised that, if the London County Council refused its consent to the loan, an appeal should be made to the Local Government Board, and that the aid of the Board of Trade should be invoked. The committee stated that an appeal to the Local Government Board would mean an appeal for the reversal of the decision of the London County Council, and possibly a local enquiry; application to the Board of Trade for a license to supply electricity would not involve an appeal against the London County Council, but the license, if granted, would remove the difficulty, the existence of which was the reason given by the London County Council for refusing consent to the loan. The committee had also considered the further opportunity of applying to Parliament next session for the necessary statutory power to borrow the amount required. Although the obtaining of an Act of Parliament and complying with the Borough Funds Act would be troublesome, they thought there would be some important advantages to be gained by such procedure. They might secure a longer period for the repayment of the loan, and the price at which they were authorised to supply could be varied, and many other useful powers could be provided for in such a Bill. The great objection to this on the part of the company is the delay, and it is on account of the Council's delay in completing that the company is proceeding with their action for specific performance. In conclusion the committee said: "Having regard to the legal advice we have received, and to the fact that we may shortly have to satisfy the courts that we are not merely doing our best, but taking all proper measures possible, and also that the delay in completing the purchase is causing serious injury to the goodwill of the business, we think there should be no unnecessary delay waiting for the decision of either Government department, and that the application for a license and the appeal from the County Council's decisions should be made simultaneously." Resolutions authorising these steps were carried, also another providing that the town clerk take steps to promote a Bill in Parliament in the event of the Government department not communicating their decision by the end of September.

Manchester Electricity Works.—The statement of the accounts of the electricity department for the year ended March 31 has now been published. The accounts show that the revenue derived from the sale of current, etc., amounts to £197,169, and the working expenses to £112,316, leaving a gross profit of £84,853. Out of this sum the following requirements had to be met: interest on mortgage debt, etc., £43,561; sinking fund, £28,070; instalment of loan repayable to the Public Works Commissioners, £4,907—£76,538; resulting in a surplus of £8,315. This surplus has been carried to the reserve fund, which now stands at a total of £25,077. During the period under review formal sanction was given by Parliament to the Manchester Corporation General Powers Bill, 1902, which contained clauses authorising the construction of Stuart-street railway, bridges to connect Dickinson-street and Bloom-street works, and subways for cables; also empowering the Corporation to raise the sum of £75,000 in connection therewith. The total borrowing powers at the present date amount to £2,246,121. The past year has seen the completion of the buildings at Bloom-street station and the erection of the four 3,500-h.p. generators. The total capacity of this station is 14,000 h.p. At Dickinson-street station four belt-driven sets, each of 400 h.p. capacity, have been dismantled and sold. On the space set at liberty there have been erected two turbo-generators, each of 3,000 h.p., and by this alteration the capacity of the station has been increased from 11,800 h.p. to 16,200 h.p. The committee are pleased to report that the work in connection with Dr. Kennedy's installation of 15,000 h.p. at Stuart-street station and the 10 sub-stations in conjunction therewith has been pressed forward with all dispatch during the past 12 months, with the result that very excellent progress has been made, and the whole equipment is now rapidly approaching completion. Although very large increased demands have been made during the past 12 months for supplies of electric energy, notably in connection with the tram service, the committee, in consultation with Dr. Kennedy, undertook to be in readiness to supply the Tramways Committee with current for working the cars on the southern routes on Nov. 30 last, and for the Ashton-road and Oldham-road routes on March 31, 1903. It is gratifying to record that these engagements were fulfilled on the dates arranged, and the cars commenced running accordingly. Steady progress is being made with the work in connection with the additional installation of the 12,000 h.p. at Stuart-street station and the various sub-stations. A statement of the quantity of electricity generated and sold since the commencement of the undertaking, shows that in the year ended March, 1895, the number of units generated was 1,277,507, and that 1,168,382 units were sold. In the year ended March, 1903, there were generated 22,198,241 units, and 19,400,223 units were sold. There were 6,836 meters in use on March 31, 1903. The total capital expenditure on land, works, etc., has been £1,713,627. The average price obtained per unit for electricity in the year ended March 31 was 2·68d. There has been a gradual decline in the price since the year 1893-4, when it was 5·57d. per unit.

Isle of Thanet.—Messrs. Handcock and Dykes, in a supplementary report, point out that the Isle of Thanet Tramway and Lighting Company's proposition was on a different basis entirely from those last considered by the committee, inasmuch as under their proposition the Corporation would not have now to raise a loan. They say this offer might be considered from two points of view: (1) that of the consumer of electricity, and (2) that of the general body of ratepayers. From the general consumer's point of view it should be noted (say the experts) that under the Thanet Company's proposition—

Digitized by Google

viz., to charge 6d. per unit the first two hours and 2½d. afterwards—the general body of consumers would probably pay 6d. a unit, as it is found in practice that the average consumption of electricity per lamp, taken over the whole kingdom, varies from 11 to 25 units per annum, which corresponds to an average use of from one hour to just over two, so that practically the ordinary consumer would never come on to their reduced rate. Messrs. Handcock and Dykes, assuming an average of two hours' use a day, and, secondly, an average of four hours' use a day, say the Thanet Company's proposition is inferior to those of Messrs. Edmundson and the National Electric Wiring Company. Turning to the question of this offer as it affects the general body of ratepayers, the experts find that there would be in the initial stage no difference between them, as, whether the Corporation accepted this offer or that of Messrs. Edmundson or the National Electric Wiring Company, either scheme would be free of expense to the town, as in the first case the money would be found by the Thanet Company, and in the second case, although the money would be borrowed by the Corporation, yet the interest and sinking fund would be guaranteed either by the company undertaking the work or by an approved assurance company. Assuming, however, that the Corporation wished to take over and work the undertaking themselves, under the Thanet Company's revised offer they could take over the mains at the end of 10 years at the actual cost to the company, plus a premium of 15 per cent., or at the end of 21 years without extra payment; but in both of these cases the Corporation would have to face the problem that they would possess no station of their own, and would then have to raise the money themselves, put down a new station, organise a staff, and undertake the generation of current, whereas, under the other two offers, at the same period, they would take over not merely the mains, but a complete station, which had been working for a number of years, which had a staff used to the work, and on which a large proportion of the capital cost had been already repaid. The experts consider the latter position a far superior one. Turning to Messrs. Edmundson's revised offer, it would appear that they were prepared to reduce their price from 7d. for the first hour and 4d. for the second to 7d. and 3d., as compared with 7d. and 2d. offered by the National Electric, and, further, that if the Corporation terminated the agreement at the end of 10 years the premium would be 5 per cent., instead of 10 per cent. as at first specified. The experts are of opinion that absolutely no financial liability would be incurred by the Corporation in the acceptance of either the offer of the National Electric or Edmundsons. They are of the opinion that by the time the Corporation took over the works they would find themselves in possession of a remunerative undertaking, which should prove a valuable asset to the town. Assuming, however, the very worst aspect of affairs, the Corporation would not take over the order until the termination of the agreement, by which time the whole of the loan would have been repaid, and the works would fall in relieved of all charges for interest and sinking fund, and without the Corporation having to pay a single penny. The experts consider that the keen competition among so many companies, whose directors are shrewd business men, to obtain control of this provisional order is a proof that the impression is that this electrical undertaking in Ramsgate will soon be a financial success. The matter is to be further discussed at a special meeting of the Council.

PROVISIONAL PATENTS, 1903.

JUNE 22.

13911. Improvements in automatic electric circuit breakers. Arthur Bernard Reynders, Carl Bennett Auel, Robert Donald Thain Alexander, and John Rudolph Spurrier, Westinghouse-building, Norfolk-street, Strand, London.

13912. Improvements in magnetic holders-up for drills and the like. William Henry Allen, Richard William Allen, and Charles Cæsar Hawkins, 24, Southampton-buildings, Chancery-lane, London.

13391. Improvements in secondary batteries. Lothar Fiedler and Frederic Julius Gerard, 22, Southampton-buildings, Chancery-lane, London.

JUNE 23.

13937. Therapeutic electromagnetic and faradic healer. Frederick Courtenay Fisher, 64, Hampton-park, Redland, Bristol.

13945. An improved electrical motor starting switch. Ughtred Horsfall, Joseph Crowther, and Thomas Cardwell Wild, all trading as "The New Contact Controller Company," 1, North-parade, Parsonage, Manchester.

13970. Improvements in indicator jacks for telephone switchboards. William Aitken, Beachcliff, Sandon Promenade Egremont.

13971. Improvements in telephone exchange systems. William Aitken, Milton-road, Edge-lane, Liverpool.

13973. Improvements in and relating to electric recording instruments. David John Steele and Charles Kratt, 75, Waterloo-street, Glasgow.

13903. Improvements in induction coils. John Splitdorf, 56, Ludgate-hill, London. (Date applied for under Patents Act, 1901, April 8, 1903, being date of application in United States.) (Complete specification.)

13992. An improved electric sparking plug for internal-combustion engines. Hugo Hirst and Herbert John Coates, 71, Queen Victoria-street, London.

14021. Improvements in galvanic batteries. Paul Brandt, 6, Lord-street, Liverpool. (Complete specification.)

14028. Improved process and apparatus for the production of metals of the alkali group and alkalies by electrolysis. Edgar Arthur Ashcroft, 111, Hatton-garden, London.

JUNE 24.

14062. An improved electrical cash-checking machine. Edgar Guess, 31, Tasman-road, Clapham, London.

14067. Improved automatic reversible dynamo to give a constant voltage irrespective of speed. Alec Gavan Inrig, Calydon, Goldworth-road, Woking, Surrey.

14079. Improvements in controlling systems for electric motors. The British Westinghouse Electric and Manufacturing Company, Limited, Westinghouse-building, Norfolk-street, Strand, London. (The Westinghouse Electric and Manufacturing Company, United States.)

14106. Improvements in electrically-operated ventilators. Herbert John Haddan, 18, Buckingham-street, Strand, London. (The Bergmann Electricitätswerke Aktiengesellschaft, Germany.) (Complete specification.)

14107. Improvements in and relating to electrically-operated lifts. Arthur Henry Adams and John Thomas Moulds, 11, Southampton-buildings, Chancery-lane, London.

JUNE 25.

14163. Improvements in apparatus for electric lighting. Frederick William Le Tall, Westinghouse-building, Norfolk-Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14164. Improvements in gas or vapour electric apparatus. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14165. Improvements in gas or vapour electric apparatus. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14166. Improvements relating to gas or vapour electric apparatus. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14167. Improvements in systems of electrical distribution. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14168. Improvements in systems of electrical distribution. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14169. Improvements in systems of electrical distribution. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14170. Improvements in starting means for gas or vapour electric apparatus. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14171. Improvements relating to gas or vapour electric apparatus. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14172. Improvements in systems of electrical distribution. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14173. Improvements relating to breaking and controlling electric circuits. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14174. Improvements in systems of electrical distribution. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14175. Improvements in gas or vapour electric apparatus. Frederick William Le Tall, Westinghouse-building, Norfolk-street, Strand, London. (The Cooper-Hewitt Electric Company, United States.)

14176. Improvements in electric heaters or rheostats. Frank Clarence Newell, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents Act, 1901, June 27, 1902, being date of application in United States.) (Complete specification.)

14190. Improvements relating to wireless telegraphy. Sidney George Brown, 45, Southampton-buildings, Chancery-lane, London.

14199. Improvements in machines for cutting turbine vanes. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Shepherd T. Fonda, United States.)

14204. Improvements in or relating to telephone systems with central battery. Gottlieb Magnus Teodor Piltz, 111, Hatton-garden, London. (Complete specification.)

JUNE 27.

14211. Improved electric switch and circuit breaker. Verity's, Limited, and Edwin John Selby, 31, King-street, Covent Garden, London.

Digitized by Google

14231. Improvements in arc lamps. Joseph Wilfred Bowley, 4, St. Ann's-square, Manchester.

14247. Improvements in "electric resistances." Hans von Kramer, 121, West George-street, Glasgow.

14269. Improvements relating to electrical fire-alarms and other electrical signalling systems, telegraphy, telephony, wireless telegraphy, and the like. Egerton Goolden Pulford, 10, St. George's-crescent, Liverpool. (Complete specification.)

14286. Improvements in cases or covers for the protection of electrical apparatus. Charles Mark Dorman and Reginald Arthur Smith, Ordsal Electrical Works, Salford. (Complete specification.)

14295. Improvements in electromagnets especially applicable for use in electromagnetic separators. The Edison Ore-Milling Syndicate, Limited, 188, Fleet-street, London. (Thomas Alva Edison, United States.)

14299. Improvements in telegraph apparatus. Henry Braun, 8, The Avenue, Barnet, London.

14300. Improvements in and relative to electrical alarm or signalling apparatus. George Rarp, 60, Queen Victoria-street, London.

14304. Improvement in sparking plugs for electric ignition of gas or oil engines. John Baxter Jarvis, Devon House, Clapham Common, London.

14309. An electric roasting oven. George Edmond Dutertre and Marie François Andre Nodet, 77, Colmore-row, Birmingham.

14318. Improvements in apparatus for regulating the supply of current in electric mains. Herbert William Butler, 47, Lincoln's-inn-fields, London.

14363. Improvements in telephone call recording systems. Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London. (The Automatic Telephone Meter Company, United States).

14373. An improvement relating to the illumination of railway or like signals by electric incandescence lamps. Siemens Bros. and Co., Limited, and Luiz Moraes Gomez Ferreira, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

14374. Improved device for securing the covers or doors of boxes and other receptacles in a tightly-closed condition. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Actiengesellschaft, Germany.) (Complete specification.)

14375. Improvements in switches for use in connection with selective electric signalling apparatus. Charles Mark Jacobs and Arthur Harold Nicholson, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published July 16, 1903.

1902.

6884. Telephonic apparatus. Graham.

13853. Electric switches. British Thomson-Houston Company, Limited. (Hewlett and Button.)

13614. Telephone connections on the party-line system. Oppenheimer. (Actiengesellschaft Mix und Genest.)

14109. Electromagnets. Timmis and Timmis.

14349. Electrostatic apparatus for measuring potentials. Ferguson and Kelvin and James White, Limited.

14430. Type-printing telegraphic instruments. Higgins.

15716. Electric cable or conductor junction and like boxes. Burnet.

16014. Wattmeter for the measurement of electrical power. Drysdale.

16492. Electrical cut-outs and regulators. Leitner and Lucas.

17222. Electric cranes, winches, and the like. Stokes.

17388. Systems of electrical distribution. Lake. (General Electric Company.)

17667. Maximum demand indicator for alternating electric currents. Evans.

17687. Maximum demand electrical indicators. Lake. (General Electric Company.)

17688. Commutator brushes. Lake. (General Electric Company.)

18076. Systems of electrical distribution. British Thomson-Houston Company, Limited. (Troy.)

18077. Electric current collectors. British Thomson-Houston Company, Limited. (Priest.)

18079. Protective devices for electric circuits. British Thomson-Houston Company, Limited. (Steinmetz.)

18082. Charging devices for storage batteries. British Thomson-Houston Company, Limited. (Lemp.)

18090. Electric meters. British Thomson-Houston Company, Limited. (King.)

18229. Field coils for dynamo-electric machines. Lake. (General Electric Company.)

18319. Electric arc lamps. British Thomson-Houston Company, Limited. (Fleming.)

18321. Systems of electrical distribution. British Thomson-Houston Company, Limited. (Stone.)

18323. Lightning arresters. British Thomson-Houston Company, Limited. (Johnston.)

18324. Systems of dynamo-electric machines. British Thomson-Houston Company, Limited. (Jeannin.)

18326. Means for preventing creeping of electric meters. British Thomson-Houston Company, Limited. (Lunt.)

18586. Electric fuses or cut-outs. Morse.

19110. Electric arc lamps. Green.

1903.

5973. Intercommunication telephone wall sets and the connections or wiring thereof. Berliner and Birnbaum.

7697. Incandescent electric lamps. Drecker.

9015. Electrical generators for producing alternating currents of low frequency. Siemens Bros. and Co., Limited. (Siemens und Halske Actiengesellschaft.)

9149. Pull-down or safety apparatus for the trolley poles of electric cars. Birkbeck. (Electric and Steam Railway Supply Company.)

9206. Methods of and apparatus for transforming electrical energy. Hewitt. (Date applied for under International Convention, April 25, 1902.)

9353. Shade holders for electric lamps. Birch.

9372. Insulators applicable to overhead tramway wires. Penny.

9586. Mechanism for controlling electric circuits. Tate and Newbery.

11193. Radiators for wireless telegraphy. Blondel.

UNIVERSITY OF

NOTES.

Wireless Telegraph Conference.—It is stated that a "preliminary" wireless telegraph conference will be held at Berlin on Aug. 4, which will be attended by "persons interested in the subject." It is not stated, however, whether the conference will be of an international character or whether it will be open to public attendance.

Royal Institution.—A general monthly meeting of the members of the Royal Institution was held on the 6th inst., Sir James Crichton-Browne, treasurer and vice-president, in the chair. The following were elected members: Lord Oxmantown, Mr. R. S. B. Hammond Chambers, K.C., Mr. M. B. Field, Mr. H. D. McLaren, Mr. G. Marconi, Mr. R. Pearce, Mr. E. P. S. Roupell, and Mr. W. Wavell. The special thanks of the members were returned to the Misses Gladstone for their present of a portrait of Dr. John Hall Gladstone, F.R.S.

Atlantic Wireless Telegraphy.—Mr. Vivyan, the engineer in charge of Marconi's wireless telegraph station at Table Head, on the other side of the Atlantic, states that he is sending messages of different lengths to Poldhu, in Cornwall, daily, but that the replies are still being sent by cable, owing to the installation of new apparatus on this side not yet being completed. He is further responsible for the statement that the apparatus at Table Head now works with ease, and that the transmission of messages is attended with the "greatest possible success."

Kew Observatory.—The officials at the magnetic observatory in Kew Gardens have found a new site for the station in Scotland, where stray electric currents from electric tramways will fail to have the present disturbing effects on the magnetic instruments. It is proposed to remove the observatory to a farm in the parish of Eskdalemuir, about 15 miles above Langholm. The farm is the property of the Duke of Buccleuch, who has expressed his willingness to grant an extensive site, and it is expected that the ground will be marked off shortly. Eskdalemuir enjoys almost perfect isolation, which is particularly suited to the delicate work it is proposed to carry out at the new station. It is an extensive upland pastoral parish in Dumfriesshire, and is 15 miles away from any railway.

Books Received.—From the Institution of Civil Engineers we have received a number of volumes which, for the most part, are reprints of papers read and discussed before the institution or some of its associated societies. Those that appeal to us more particularly as having an electrical interest are the following: Address of Mr. John Clarke Hawkshaw, the president, delivered in November, 1902; "Limmat Valley Electric Road Railway," by Mr. Chas. S. Du Riche Preller, Ph.D.; "Wrought-Steel Conduits," by Mr. H. F. Lloyd; "Automatic Circuit Breakers," by Mr. B. Hopkinson; "Electric Tramways," by Messrs. C. and B. Hopkinson and Ernest Talbot; and "High-Speed Electrical Generating Plant," by Mr. T. H. Minshall. In most cases the discussions that took place on these papers are given. Another useful volume issued by the institution is one giving a large number of abstracts of papers published in scientific transactions and periodicals. We have also to acknowledge the "Year-Book" of the Armour Institute of Technology of Chicago, and the May number of the *Wisconsin Engineer*.

Prussian Railways.—The Prussian State Railways Administration is pursuing the right course in regard to electric traction. It has already established a good lead in the displacement of steam locomotion by electrical working, and has just decided on another step in the same direction. Briefly, the decision is to run all the trains on the suburban railway between Berlin and Lichterfelde by electric traction. This is said to be an outcome of the long series of trials on the military railway between Berlin and Zossen, which proved the advantage of propelling trains by electric power. An experimental train has been running on the Berlin-Lichterfelde section for the past month with much success, and on the 15th inst. steam locomotives will be entirely banished from the line. The method of working will be by motorcars, each train consisting of two long coaches, one second and one third class, each with separate compartments for smokers. The advent of electrical working on one of Berlin's suburban lines is regarded as the beginning of a new era in railway locomotion in that city, which will soon see steam haulage on all the suburban lines replaced by electric propulsion.

Physical Society.—At the ordinary meeting of this society held in the Physiological Laboratory, University of London, on the 26th ult., Dr. Waller gave a demonstration of "The Effect of Light on Green Leaves." The origin of these researches was the result of the consideration of the retinal effects after light stimulation, and the wish to have a sensitive surface naturally spread out for examination. The effect of light is to produce a current (of an E.M.F. of the order of 0·01 volt), at first from the illuminated to the dark parts in the leaf, and later (or as an after effect) from dark to illuminated. These currents are apparently an index of two opposite processes in the leaf—*i.e.*, dissimilation and assimilation—and give very close analogies to the analogous processes in animal tissues—*e.g.*, nerves. Dr. Waller also demonstrated the "blaze" currents in animal and vegetable tissues. These are seen when a strong exciting current (such as an induction shock of sufficient voltage) is led through a pair of non-polarisable electrodes, and these are then connected with a galvanometer. An electrical response (of greater energy than the exciting current) is given in a direction commonly homodrome to the latter—*i.e.*, in the reverse direction to the ordinary polarisation counter currents. This "blaze" response is the algebraic sum of post-anodic and post-kathodic currents; the resultant is commonly homodrome, but an antidrome blaze, distinguished from polarisation by its much greater order of magnitude, is also seen.

Absence of Electrification in Condensation.—It has long been known that neither in cases of ordinary evaporation or condensation is there an accompaniment of electrification. On the other hand, when a mass of water is suddenly shattered as in jets, the electrification produced is marked. The electrification soon vanishes, however, whereas the nuclei persist. The question thus occurs, whether in ordinary slow evaporation the absence of an electric effect may not be due to the fact that the charges vanish too quickly to be noticeable. The matter has been enquired into by Mr. C. Barus, who has communicated to the American Physical Society the results of an examination of the case for sudden condensation and the rapid evaporation of fog particles. To test this question, a graduated electroscope was introduced into the condensation chamber. To insulate it in the saturated atmosphere, the stem was enclosed in a rubber tube open below, and only in contact with the stem at the top (sealing-wax joint). The tube was thoroughly dried before insertion into the chamber, and the instrument showed satisfactory insulation for a half hour or so, after which it was removed for desiccation prior to new experiments. Condensation was produced by sudden exhaustion, as usual. The nuclei used were obtained from the air as well as from phosphorus. The method of experiment consisted in observing the normal leakage of the charged electroscope by observations

Digitized by Google

made every half minute. Nuclei were then introduced, and the experiment repeated with the alternate sudden production and sudden dissipation of fogs between each observation. The two curves of leakage were not distinguishable even when the fogs were of the densely opaque character due to phosphorus. The error of the method was about 5 per cent., with somewhat larger uncertainty for the case of fog evaporation.

The Gordon-Bennett Cup.—From a technical point of view, electrical interest in the great "motor Derby," as it has been called, is not large. The race for the Gordon-Bennett cup, however, serves to indicate the spirit of automobilism which is pervading the people, and the immense interest which has been taken in this year's contest is evidence of the progress which the motorcar is making in this country. The Irish race was the fourth of the series of contests for the cup given by Mr. James Gordon-Bennett, and resulted in a victory for a representative of Germany—M. Jenatzy, on a Mercedes car. He did the run of 370 miles in 10 hours 15min. 1-5sec. It cannot be said that the race proved an instruction in any particular branch of automobilism, except, perhaps, that in such contests more depends on chance than on the skill of the driver or the mechanism of the car. For instance, all the American and English competitors were knocked out of the race by accidents which happened to their cars, and for which they were in no way responsible. We are glad to be able to record that no fatality occurred, as was the case in the recent Paris-Madrid automobile contest, although the Irish course is said to have offered many a dangerous incline and curve to motors running at an average speed of something like 45 miles an hour. All things considered, the race was a very successful and popular one, and there has naturally been considerable exultation over the German victory, although motorcars are not generally popular in Germany.

American Pacific Cable.—America is now the proud possessor of a direct cable to the Far East, and it is particularly gratifying to that country, and incidentally to the engineers engaged on the work, that the enterprise was accomplished by July 4—a day memorable in the history of the independence of the United States. On the evening of the 4th inst. the last connection of the cable, which has been laid by the Commercial Pacific Company, was made at Honolulu, when President Roosevelt sent his greetings to General Taft at Manila and to the people of the Philippines. The new cable with which American enterprise has girdled the Pacific is probably the outcome of the example set by England and the European Powers of connecting their colonies by cables which they can control in time of war. According to a Reuter message from New York, the President of the United States at 11.20 on Saturday night sent the following message to Mr. Mackay, the president of the Commercial Pacific Company, who was with him at Oyster Bay, New York, so that the message was cabled round the world in a westerly direction: "Congratulations and success to the Pacific cable, which the genius of your lamented father and your own enterprise made possible." The message came back at 11.35 p.m. Mr. Mackay's reply to Mr. Roosevelt, which was sent eastward around the globe, returned in 9½ minutes. The text was as follows: "I thank you deeply for your message, and earnestly hope that the Pacific cable, by opening the wide horizon of the great East, may prove a useful factor to the commerce of the United States."

King's College.—Thursday last week was "Prize Day" at King's College, when Sir Wm. Anson, M.P., distributed the prizes gained by students during the past year. The Rev. Dr. Headlam, the new principal, in opening the ceremonies, remarked that the engineering faculty had been entirely reorganised under Prof. Capper, who at the present time was engaged in working out a new departure in engineering education which might be of great importance for the country. In the course of an address after distributing the awards, Sir Wm. Anson observed that the feature of education at the present time was the direction which it took towards practical utility. They had been lately informed that a great impulse would be given to technological study in London by the offer which had been made to the London County Council of money in order to form a great technological institute How far-reaching that offer might be it was impossible to say, but it seemed to suggest very large and very fortunate results to the practical studies of this country. He learned also that the engineering school of King's College was likely to take a new development, and that the students of engineering in the college would be able to combine in a singularly happy way practical work with scientific study. It was plain that these practical scientific studies would take a large place in the education of London, which was a most important factor in the education of the whole country. But he begged those who took an interest in technological study to remember that technology and engineering did not represent the sum total of human interests, and that there were other departments of the field of knowledge into which in their leisure hours they might wander The annual conversazione followed, the guests, who numbered about 2,000, being received by the Principal and Mrs. Headlam.

Motor Speed Trials.—The world's record for the flying kilometre was substantially lowered in the motor speed trials which took place in Phœnix Park, Dublin, last Saturday. The interesting feat was accomplished by Baron De Forest on his 70-h.p. Paris-Madrid Mors, who brought the record, which previously stood at 29 seconds, down to 26⅘ seconds. This represents travelling at the rate of 86 miles an hour. In other contests on Saturday previous records were also greatly reduced, including those for motor cycles and tourist cars. The great event of the day was that involving a contest in which racing cars ran against each other instead of against the clock. Such a competition was only made possible by the possession of a broad and straight course, and happily there were no casualties. Hill-climbing and speed trials, the third important event in the programme of the Automobile Club's "Irish Fortnight," took place on Tuesday at Newcastle, in County Down. There were, as usual, plenty of competitors, and the hill selected for the contest offered a severe test, having a gradient of 1 in 7. The race was open to all types of cars, and the Henry Edmunds trophy was carried off by Mr. Campbell Muir on his 60-h.p. Mercedes, Mr. C. S. Rolls on his 80-h.p. Mors being placed second. The course was officially declared to be 1,200 yards in length, and the winner accomplished the run in 32⅖ seconds, or at the rate of 76 miles an hour. Those securing first place in the other events were as follows: Motor cycles (hill climbing)—Mr. A. C. Wright on an Ormonde bicycle equipped with a Kelacom motor; motor cycle speed trial, Class A—Mr. W. Hacking, Ormonde bicycle, Kelacom motor; Class B—Mr. H. Martin, Excelsior Cycle, Motor Manufacturing Company's motor; *Graphic* trophy for tourist cars—Mr. J. Scott Montagu, M.P., 22-h.p. light Daimler; speed trial for racing cars, Class A—Mr. A. Rawlinson, 30-h.p. Daracq; Class B, Mr. Louis Rigolly, 100-h.p. Gobron-Brillie.

Tramway Subways. — In entering upon a form of tramway construction which has never before been

Digitized by Google

UNIVERSITY OF MI

attempted in this country, the London County Council are wise in taking steps to acquire all possible information with regard to such schemes from actual experience in other countries. When the scheme in hand is for the construction of a tramway subway, one's attention is immediately directed to America, where, we believe, the city of Boston has the credit of carrying out the first shallow tramway construction in the world. At any rate, this is by far the most important work of its kind which has yet been executed, and it will be remembered that the details of the construction and method of working of this subway were reported upon by the tramways manager (Mr. A. Baker) and the electrical engineer (Mr. J. Rider) to the London County Council after their visit to America in 1901. Since then, however, there has been in progress the construction of an important tramway subway in New York, and it is proposed that Mr. Rider shall again this summer visit America with the purpose of informing himself of the methods which are being adopted in connection with the most recent construction of subway tramways. As our readers are aware, the County Council have commenced to carry out the construction of the tramway subway authorised by Parliament to be made under the new thoroughfare from Holborn to the Strand, and it is, therefore, very desirable, having regard to the importance and magnitude of the work, that the engineer under whose direction it is to be executed should have an opportunity of examining the conditions under which similar works are carried out in the States. Mr. Rider has, as was the case two years ago, promised to devote a portion of his annual leave to this purpose, and his committee are hopeful that it will be possible for him, while in America, to examine the most recent forms of tramway construction in New York and other cities, and thus obtain knowledge which will be of great value in connection with the execution of the tramway construction works to be carried out by the Council in London.

Engineering Standards Committee. — Messrs. Robert Atkinson, Limited, of Salisbury House, London-wall, E.C., inform us that, under the authority of the Engineering Standards Committee, they are preparing and issuing codified lists of the committee's findings in a form which should prove of great assistance to all buyers and sellers of British engineering sections. To render this publication a standard work of reference, arrangements have been made to include in it complete lists of the manufacturers and merchants who roll or stock the standard sections. Messrs. Atkinson have just issued a pamphlet giving a short history of the committee and their work, which will no doubt interest many of our readers. It contains a list of the various committees and sub-committees engaged in considering the question of standardisation, together with the names of the members who compose them, and a statement of the work with which each is occupied. The committee on electrical plant is divided into four sub-committees. One, on generators, motors, and transformers, is collecting evidence as to how far standardisation can be introduced in the construction of these machines and their component materials. Another, on temperature, is conducting experiments to determine the ability of different insulating materials to withstand heat, and also the deteriorating effects produced by their exposure to heat over long periods. A third is considering the standardisation of cables and of underground conduits other than tramway conduits, and is engaged in drawing up standard tables which should simplify and cheapen the manufacture of cables. The fourth is occupied in the preparation of standard tables and specifications for wires and with other matters directly affecting the construction of telegraphs and telephones. Other committees are concerned with screw threads and limit gauges, with pipe flanges, and with cement, there being also a committee for publications and calculations, and another for finance. Some two dozen representatives of public departments such as the War Office, the Admiralty, the Board of Trade, and the India Office, are serving on these different committees, and the Government has further shown its appreciation of the work by coming to their financial assistance with a grant of £3,000, as announced some time ago.

Proposed New Automobile Legislation.—In the House of Lords on Tuesday Lord Balfour of Burleigh introduced his Bill to amend the Locomotives on Highways Act, so far as it relates to automobiles. In the first place the Government proposes that, through the agency of the county and borough councils, every motorcar shall be registered, and carry a mark indicating the number as well as the local authority in whose district it has been registered. The responsibility for this identifying mark being at all times visible is laid upon the driver of the car. Then, as regards licenses, Lord Balfour proposes that any one who drives a car "for hire, fee, or reward" shall have to procure a license, but this obligation does not extend beyond such drivers, and it is not proposed that anyone other than those persons who drive for hire or reward shall be obliged to take out a license. In the event of a conviction a license may be suspended, endorsed, or forfeited, at the discretion of the Court. It is not proposed that the license shall be a test or guarantee of skill, as obviously there is no security that the most skilful man may not be the worst offender. On the important question of speed the Government's proposals are, on the whole, fair and equitable. It is proposed that the absurd 12-mile limit shall be repealed *in toto*, "except as respects any special limits or places," to which it may be applied by a regulation of the Local Government Board, with a view to the public safety. Further, a prohibition is put on all "reckless or dangerous driving," as evidence the following provision: "If any person drives a motorcar on a public highway recklessly or at a speed which is dangerous to the public, having regard to all the circumstances of the case, including the nature, condition, and use of the highway, and the amount of traffic which is actually at the time or might be expected to be on the highway, that person shall be guilty of an offence under the Act." Finally, the penalties for offences against the Act are increased, and there is indication, from what Lord Balfour stated in the House of Lords, that for a third offence imprisonment without the option of a fine may be imposed by the magistrates. The Bill was somewhat severely criticised by Lord Rosebery and others, but eventually it was read a first time. The second reading is fixed for next Tuesday, so that the Bill has a good chance of becoming law early next year. The measure applies to Scotland and Ireland as well as England.

Paris Tramways.—More than once lately have we had occasion to refer to the crisis which is surely approaching in regard to the electric tramways in Paris. As everyone knows, the majority of the tramway undertakings in Paris are operating at a loss, which is generally attributed to over-capitalisation, due to the compulsory adoption of the expensive underground conduit system. A contributory cause, perhaps, is the low fares which the municipal authorities compel the companies to run their cars at. With both these restrictions the public is, not unreasonably, perhaps, wholly in agreement. The companies are thus placed "between the devil and the deep sea." They are now looking to the overhead trolley system for salvation,

Digitized by Google

but appearances incline to show that they are again destined to failure in their meritorious attempt to place their undertakings on a profit-earning basis by adopting a cheaper system of traction. In the first place, the Parisians, who are known to be exceedingly jealous of the appearance of their streets, are up in arms at the new proposals, which they regard as heralding the approach of "a hideous network of overhead cables." On the other hand, the municipal authorities are very much opposed to the overhead trolley system also, it is believed, for æsthetic reasons. Thus the Paris tramway companies are in anything but an enviable position, and matters are made worse by the case of the East Parisian Tramway Company. Our readers will remember that last April this company obtained permission to use the trolley system for six months, as a temporary measure, while the tunnelling work for the underground railway was going on under the tramway company's line of route. Naturally enough, the company want to retain this system of working, but most unreasonably, in our opinion, the County Council of the Seine is offering the most strenuous opposition to this proposal, and has even refused to enter into negotiation on the subject. Other electric tramway companies in Paris are in much the same position, and matters are fast approaching a crisis, which at least can result in no worse position for the companies than they at present occupy. A suggestion for forcing the local authorities to be more conciliatory is made that on a given day all the tramways in Paris should stop running, thus causing great public inconvenience. We are afraid, however, that the companies are very much under the thumb of the local authorities, and even this resource is denied them, for the probable consequences would be that their concessions would be cancelled.

Electricity in Mining.—At the meeting of the Institution of Mining Engineers in London last week, two very interesting papers on electrical subjects were contributed respectively by Mr. A. S. E. Ackermann and Mr. A. Campbell Cormack. The former dealt with pneumatic and electric locomotives in and about coal-mines, the information being based upon the author's recent tour in the States. He pointed out that the local conditions in America are very different from those obtaining in this country. In America the seams are much thicker and nearer the surface, the dip is very much less, 5 per cent. being the maximum, while faults are almost unknown. Further, a large percentage of the mines are drift mines. The electric haulage system adopted is the overhead trolley, very similar to the electric trams in this country. Pneumatic locomotives are more cumbersome than electric. In some mines both the locomotives and the coal-cutters are worked by pneumatic power, but the more usual arrangement is to have electric haulage, even where the cutting is done with pneumatic machines. It has been stated that the cost of an electric installation is only one quarter that of a pneumatic plant, but the author does not think the difference can be quite so great. In upkeep the electric system also has the advantage, while the efficiency of electrical transmission of energy is considerably higher than that by air. In the discussion which took place on this paper, Mr. Dixon considered that compressed air properly employed would be as cheap as electrical energy for use in coal-mines. Mr. T. E. Forster, referring to the compressed-air locomotives used some years ago in Lord Durham's collieries, said they were only partially successful, owing probably to the smallness of the section. With a big section seam electric locomotives could, he thought, be used with advantage. Mr. J. Gerrard, H.M. inspector of mines, argued that before electricity could be introduced into mines electrical experts must be more agreed than they were at present as to what was safe and what was unsafe. In the second paper, that by Mr. Cormack, the author took up the subject of electrical plant failures. He insisted that with reasonable care in design, manufacture, and working, electric machinery could be and had been made more reliable than steam, gas, or oil power plants. As the result of an analysis of the breakdowns that had occurred to several thousand machines, chiefly to dynamos and motors, extending over a period of four years, Mr. Cormack showed that constructional defects were responsible for 39·36 per cent. of the breakdowns, and of these 18·36 were due to bad design, 7·4 to the perishing of insulation, and 13·6 to bad workmanship. Defective attention caused 22·5 per cent. of the breakdowns. In the discussion, Mr. G. S. Corlett said he had traced the history of 65 machines employed in collieries, and he found that the average number of failures was two per annum. Mr. Chandler suggested that a committee should be appointed to consider the whole question of coal-cutting machines, and the suggestion was referred to the council of the institution for consideration.

Pollak-Virag Rapid Telegraph.—The invention which goes under the above name has been elaborated during the past six years by Messrs. Autal Pollak and J. Virag, who claim to have achieved some remarkable results in operation. We have just received from the inventors a paper describing this letter-writing rapid telegraph system, which is very interesting, especially as they state that telegraphing is now going on successfully with their apparatus between Berlin and Frankfort-on-Main, a distance of about 370 miles. In abstract the *modus operandi* is as follows: The text of the telegram to be dispatched is noted down on paper ribbons in perforations, reminding one of the Morse signs. This notation is made by means of a perforating device which is perfectly independent of the telegraph apparatus. The sign transmitter deals with these paper ribbons quite automatically. The paper ribbon is carried through two rollers. One of these rollers consists of rings, isolated from one another, each ring being electrically connected with the corresponding junctures of a battery, giving different degrees of potentials. Immediately the wire brush, pressing on the roller underneath the paper ribbon, passes over a hole in the same, the battery sends during a certain period a current through the brush into the line. In this way one is able to dispatch about 400 current impulses per second. The receiver makes use of the vibrations caused by the current in the sensitive diaphragm of a telephone to receive these rapid series of impulses. By means of a mirror resting on a point firmly fixed in front of the vibrating diaphragm, the vibrations throw rays of an incandescent lamp on to a ribbon of sensitive paper. In this way the vibrations of the diaphragm are photographically fixed in the shape of a wave line. An ingenious part of the invention is the improvement by means of which the inventors, through double transmitting and receiving apparatus of twofold impulses sent on a double wire, impart to the small mirror mentioned a twofold movement—namely, a vertical and horizontal axial vibration or movement. By a successful combination of these vibrations, the reflected ray writes the text of the telegram in the well-known letters of the written Latin alphabet on the light sensitive paper ribbon. The photographic development and fixing take place automatically in a special part of the receiver, so that the portion of the ribbon leaving the apparatus which contains the full contents of the telegram can be delivered direct to the person addressed. It is claimed to be possible with the

Digitized by Google

Pollak-Virag system to transmit at a speed of 50,000 words per hour, according to the length and the nature of the wire.

London County Council Tramways.—Lord Avebury's criticisms of the working of the London County Council tramways south of the Thames have, unfortunately for him, not the merit of accuracy, and we do not expect that the statements—many of them erroneous—which he made before the Industrial Freedom League will carry much weight among thinking men. In case, however, there should be some who are inclined to agree with Lord Avebury's view that the undertaking under municipal control is working at a loss, when it might be profitably carried on by private enterprise, it is well to refer to a letter which Mr. J. Williams-Benn, chairman of the Highways Committee of the London County Council, has published in the daily Press. Mr. Benn repudiates Lord Avebury's statements almost in every particular, and shows that the £200,000 a year offer which his lordship alleges the Council received from a private company for a lease of the Council's system was not an offer which the Council could accept. It did not, as was conveyed by Lord Avebury, represent a net annual profit of £200,000 per annum to the Council, as the latter would first have had to raise the money to buy the lines (about 100 miles), and then when the interest and sinking fund was provided the offer dwindled down to a very insignificant figure. Lord Avebury's main allegation is that the Council have lost £30,000 in the past year, forgetting to state that during that period the lines were under reconstruction for electric traction, which resulted in temporary interruptions of the tramway service. But we cannot do better than quote Mr. Benn on this point, as the argument he puts forward is convincing beyond contradiction. He says: "I am sure Lord Avebury will be fair, and take the whole of the period since the London County Council started, because now that electric cars are running we are rapidly increasing our receipts. He will then see that, instead of a loss, the Council has secured a substantial profit on its southern system of £79,000, and, further, a reserve fund of £25,000. But Lord Avebury asserts we have lost money, because we did not lease these lines to a company instead of working them ourselves. There is a complete answer to that. Our predecessors, the London Tramways Company, made a definite offer, duly reported to the Council, based on the North Metropolitan rent, which was approved by Lord Avebury. The controller reported that after deducting interest and sinking fund charges the offer would yield £14,250 per annum net profit to the Council—*i.e.*, £57,000 for the four years. But we have secured £79,000 and a reserve fund of £25,000, and that after giving the men one day's rest in seven, without reduction in wages, better wages to the poorer classes of labour, and a 10 hours' day, all-night services, and a large increase of those halfpenny fares which have proved so helpful to 50 millions a year of workers. If these poor people travelled on Lord Avebury's company lines they would pay £100,000 a year extra in fares, for, alas, there are no halfpenny fares in the frigid north. There the old hours of labour and wages obtain, and all-night services have been few and far between."

High-Frequency Discharges.—At an extra meeting of the Junior Institution of Engineers, held at Finsbury Technical College, Mr. R P. Howgrave Graham, A.I.E.E., lectured on "High-Frequency Electric Discharges," attracting a large audience. The lecturer first explained the principles of self-induction and capacity, and the conditions necessary for their combination to produce oscillatory discharges of exceedingly high frequency. This was elucidated by mechanical analogies, including one based on hydraulic principles, and perfected by Prof. Northrup. As direct proofs Mr. Graham spoke of the reduction of the frequency to so low a value as to cause the spark to emit a musical note, and of the measurement of the oscillation period by photographing the discharge with the aid of moving plates or revolving mirrors. The range of frequency of electric oscillations up to 30,000 million per second was briefly sketched, and, as a rough guide, the figure given for most of the experiments shown was from 400,000 to 800,000 per second. Some attention was given to practical details, including sources of supply, regulation of spark gap, and the use of strip connections to allow for the confinement of these currents to the surface layers of their conductors. The enormous effects of self-induction were demonstrated by the lighting of an ordinary 100-volt lamp, short-circuited by two or three feet of ¼in. copper rod. Equally striking induction effects were shown, including the lighting of a lamp at 7ft. distance by the currents induced in a secondary of only three turns of rather large area, the primary being a similar coil on the opposite side of the lecture table. The lecturer emphasised the importance of syntony, and showed an experiment in which a lamp was caused to vary between darkness and extreme brilliancy, the tuning being performed by sliding a wire along an adjustable self-induction until a point was reached where the natural vibration period of the receiving circuit was identical with that of the transmitting coil a few feet away. After a demonstration of other high-frequency phenomena, Mr. Graham explained that currents which would kill at ordinary periodicities could be passed with impunity through the human body at very high rates of vibration, and showed a 100-volt glow lamp worked by the current flowing through him from hand to hand. He then dealt at some length with the medical aspect of the subject, and exhibited a neat and well arranged high-frequency medical apparatus made by Mr. Hillier and Mr. Cossor, of Farringdon-road. An account, illustrated by lantern slides, was then given of the work of Nikola Tesla and others, after which several beautiful experiments with a large Tesla coil were shown, including direct and brush discharges at very high voltages. Mr. Graham took long sparks to his body, charging it to a high alternating potential, faint glows and brushes being visible at his finger tips. These became purple tree-like discharges, ending in pale-blue streamers a foot long on approaching the free hand to a plate on the other coil terminal. Sparks 1½in. long were given to members of the audience from the lecturer's hands, and isolated vacuum tubes were made to glow brightly in the space surrounding the apparatus, which, with all metal objects attached to it, gave out brushes and streamers at all points. The very high-voltage current, after passing along a single transmission wire of No. 40 Eureka, flowed through the primary of a small coreless transformer and into an insulated metal plate, there being no return wire. The secondary of only five turns lit a 25-volt lamp. Eventually the transmission wire was cut and the power for a smaller lamp was transmitted by electrostatic induction between two plates more than a foot apart. Mr. Graham, in speaking of the future possibilities of high-frequency work, entertained hopes that at some future time power might be successfully transmitted to a distance without connecting wires, but concluded by expressing his opinion that at present it cannot be said to extend its sphere of usefulness beyond electro-therapeutics and wireless telegraphy. A vote of thanks was accorded the lecturer, special reference being made to the highly successful series of brilliant experiments with which the lecture was illustrated.

THE TEMPORARY POWER STATION AT THE WORLD'S FAIR, ST. LOUIS, MO.

In order to furnish the electrical energy necessary before the opening of the Louisana Purchase Exposition, and especially to take care of the lighting and illumination during the dedication ceremonies which took place on April 30, May 1 and 2, a temporary power station was erected on the World's Fair ground. The building, which is constructed of wood, is located just north of the boiler-house and occupies a space 10m. by 30m. Two-thirds of this space consists of the boiler-room, the engines and generators occupying the remainder. The following machines and apparatus are now installed in this power plant: one 700-h.p. marine-type boiler, furnished by the Düsseldorf Rattingen-Roehrenkesselfabrik, formerly Dürr and Co., Rattingen-Düsseldorf; one 300-h.p. Morrin-Climax water-tube boiler furnished by the Clonbrock Steam-Boiler Company, Brooklyn, New York (Fig. 1); one 250-h.p. boiler, the same make; one Sorge-Cochran feed-water heater and purifier with a normal rating of 1,500 h.p., furnished by the Harrison Safety Boiler Works, Philadelphia; one Cochran separator of the same make; two duplex steam-boiler feed pumps having a capacity of 385 L. per minute, when working against a boiler pressure of 11½ atmospheres—these are furnished by the National Steam-Piping Company, Upper Sandusky, Ohio; one 300-h.p. high-speed automatic tandem compound steam-engine, running at 225 revolutions per minute, with flywheel governor, furnished by the Buffalo Forge Company, Buffalo, New York—this engine is direct connected to a 200-kw. two-phase Stanley generator (Fig. 2) operating at 2,200 volts and 60 cycles (the Stanley Electric Manufacturing Company, Pittsfield, Massachusetts, is the maker); one 240-h.p. high-speed Skinner engine with flywheel governor running at 212 revolutions per minute, furnished by the Skinner Engine Company, Erie, Pennsylvania—this engine is direct connected to a 150-kw. single-phase Warren generator at 60 cycles, operating at 2,200 volts and 60 cycles; one exciter set, consisting of a single-phase alternating-current motor of 5 h.p., 110 volts, 60 cycles, 1,750 revolutions per minute, direct connected to a direct-current dynamo of 4½ kw., 125 volts (Fig. 3)—this set was furnished by the Wagner Electric Company, St. Louis, Missouri; one direct-current dynamo, 4 kw., 60 volts, made by the Northern Electric Company, Madison, Wisconsin—this machine furnishes exciting current

FIG. 1.

for the Stanley generator, and is belt-driven (Fig. 2); three single-phase static transformers (Fig. 4) for constant current, with a capacity of 100 arc lamps, 6·6 amperes each—these were furnished by the General Electric Company, Schenectady, New York; two distributing switchboards (Fig. 4) for the arc lamp installation; two switchboards (Fig. 2) containing switchboards and instruments for the generators. The accompanying figures

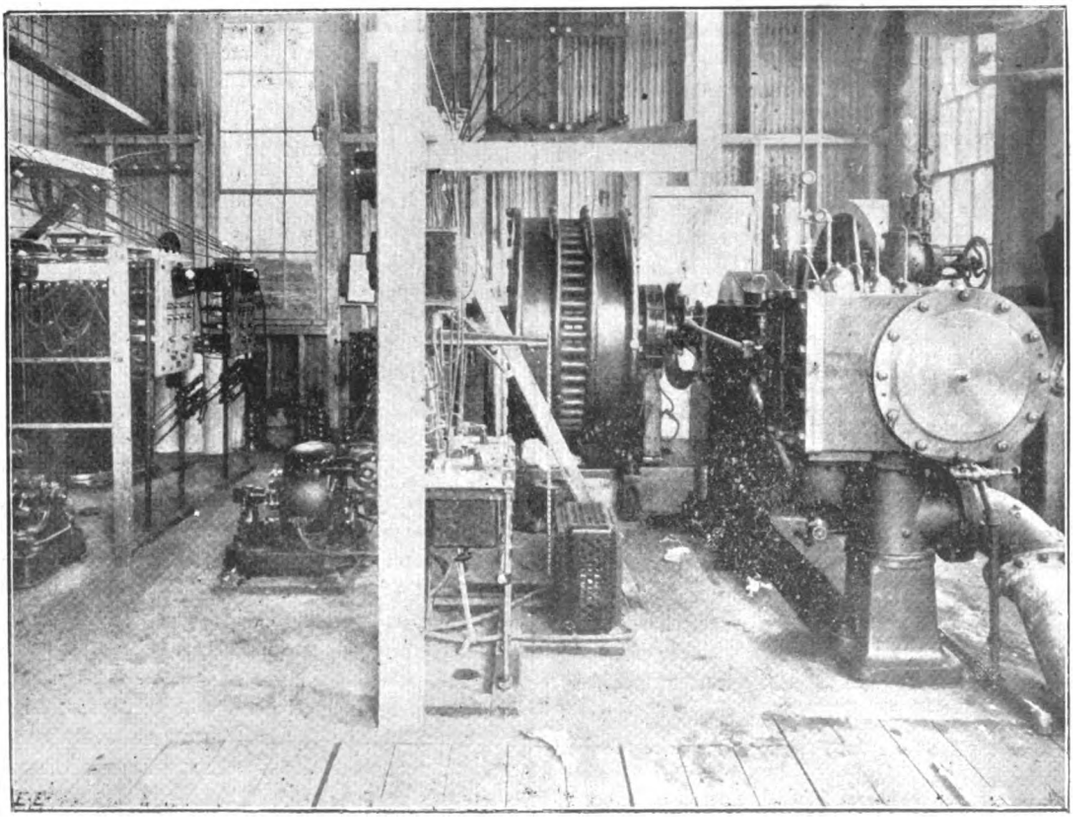

FIG. 2.

Digitized by Google

illustrate the above-mentioned machines and apparatus, and some of the peculiarities of these may be of interest to European engineers. The Morrin-Climax

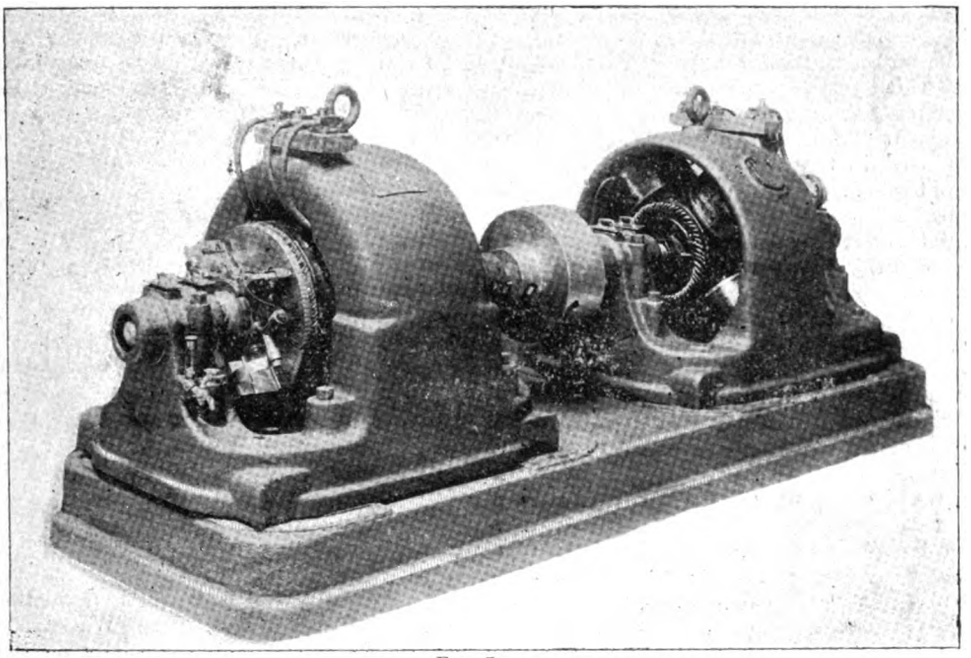

FIG. 3.

boilers (Fig. 1) are of the vertical water-tube type; the water-tubes being placed spirally around the vertical cylinder, the upper end of which forms the steam-drum; the exterior form of the entire boiler is that of a vertical cylinder. The firing is done by hand through four firing holes placed around the base, which has a practical disadvantage in that the fireman must go round the whole boiler in order to keep his fires fed; it is also awkward to handle the coal. The gases strike the lower tubes, and, after passing up the entire height of the boiler, enter the flue; this construction may not be without criticism so far as the real theory of steam-boiler construction goes, but it is worthy to note the simplicity of the mechanical construction and the ease with which the boiler may be installed. The mantle of the boiler is, as can be seen by the illustration, composed of several steel plates bolted together, on the inside of which is a layer of firebrick. These bricks are 200mm. square and each is secured to the sheet by means of a bolt; the joints between the bricks are smeared with cement mortar, and it can be seen that the boiler can be readily installed without the help of a trained mason, and, in fact, the boilers here shown were installed under the supervision of a foreman employing only ordinary labourers. The great advantage of this construction becomes evident when it is taken into consideration that on account of the strictly organised labour unions ruling the entire country, special work must be executed by the men belonging to a labour union. These workmen are three to five times more expensive than the common

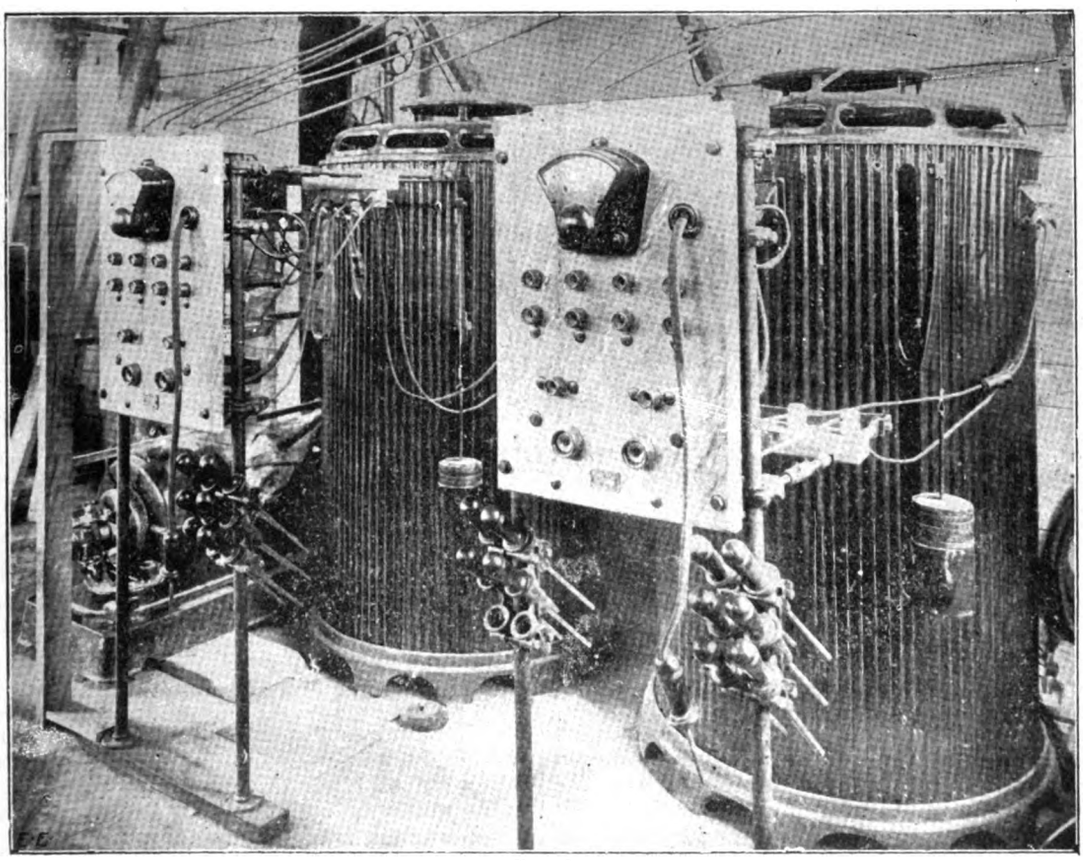

FIG. 4.

Digitized by Google

helper, and thus the economy in the boiler installation is apparent. In the States everything is made for the purpose of saving expensive installation forces. Each of the mantle sheets is provided with a door, by which the tubes are accessible for small repairs. In case a tube must be removed, the whole plate can be taken out.

Regarding the steam-engines, it may be briefly stated that they are provided with common slide valves, whereas such sized machines for driving electrical machinery in Europe are always built with Popet valves. Popet valves are seldom employed in the United States, and even the largest engines of 8,000 h.p. to 15,000 h.p. on the Manhattan Elevated Railroad in New York work with Corliss valves. Another essential difference between the American and European types is in the governor. The flywheel governor as shown on these engines is employed extensively in the States, chiefly on account of the simplicity and cheapness of construction, even though it is true that these governors are not as exact in regulation. Wherever weight governors are employed they are always driven by a belt, and only very recently has the American engineer got to realise the disadvantage of this construction and begun to employ a chain or gear transmission. The cheapness of the belt construction seems to be the only reason for still clinging to this type. Both the Stanley and Warren generators are of the revolving-field inductor type, the fields of both being excited by stationary coils, so that only the pole-pieces revolve; thus no slip-rings are necessary. The construction of the Stanley generator is very similar to that of a machine described in January, 1895, by Dolivo von Dobrowolsky. The magnetising coil is placed in the middle of the machine, and is embraced by the pole-pieces, which are semi-elliptic in form. On the one side of the coil all poles are north and the other south. If the exciting current is constant, the magnetic relations existing between coil and core are constant; if the field be revolved, current is generated by a succession of north and south poles supplied by the armature. That of the Stanley only the levers and blind contacts is placed over the marble plate bearing the live contacts. This machine shows still another interesting device which is seldom found on European machines. In Fig. 1, on the left side of the steam-engine, an iron case will be seen, to which two wires are connected. This iron case encloses two magnetic coils, the purpose of which is, according to the statement given by the manufacturer, to demagnetise the shaft of the steam-engine which is magnetised by the magnetic stray field of the machine. The Warren generator is, as mentioned above, built essentially on the same principle as the Stanley generator, but the exciting coil is placed on one side, and, therefore, the poles rotating before the armature are either north or south. This machine has also a similar supplementary magnetic coil for the purpose of correcting the stray magnetic field of the machine. This coil, enclosed in an iron case, resembles very much a pulley, and is placed in this case in front of the machine, and not between dynamo and steam-engine.

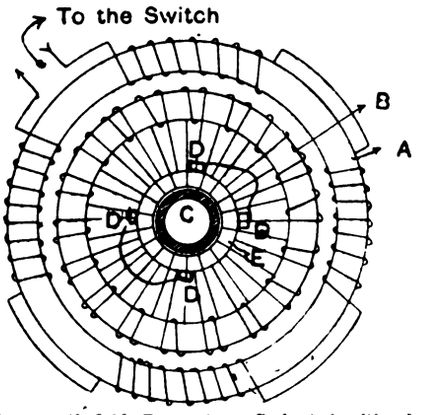

FIG. 5.—A, magnetic field; B, armature; C, short-circuiting device D, brushes; E, commutator.

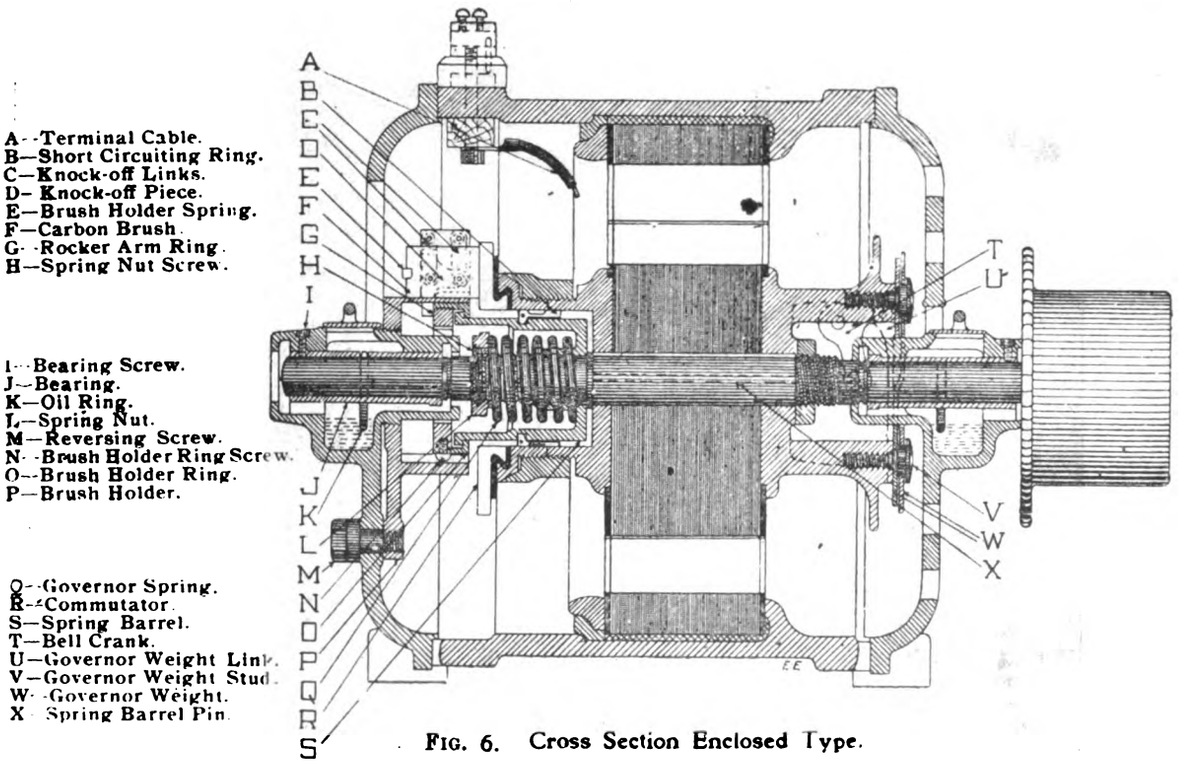

FIG. 6. Cross Section Enclosed Type.

generator is the scheme for independent voltage regulation in two phases. The terminals of the phase are conducted separately to a marble panel attached to the machine. The windings of the last armature coil of each phase are sub-divided, and from these sub-divisions taps are connected with a series of contacts of the panel; by shifting the lever over these contacts the voltage can be altered between the limits of 10 and 15 per cent. of the total voltage of the machine. In order to prevent a short-circuit between two adjacent sub-divisions when the lever touches two contacts, a choke coil is inserted. A second marble plate carrying

The Northern exciter embodies no novel features. The Wagner exciting set consists of a single-phase alternating-current motor driving a direct-current generator, and is worthy of notice. The principal patents covering the construction of the motor were granted to Prof. Arnold, of Karlsruhe, the United States patents being granted in 1895. Single-phase alternating-current motors have been built on similar principles as early as 1893 by the Maschinenfabrik Oerlikon, but this firm did not continue the manufacture of these motors on a large scale, on account of the fact that three-phase current has almost

Digitized by Google

entirely supplanted the single-phase system in Europe. In the United States a great number of single-phase alternating-current stations are employed, and even now preference is often given to the single-phase system on account of its simplicity and cheapness in wiring. It may be also noted that several prominent American engineers are now experimenting with a single-phase alternating current for electrical railroad work. The connections of the single-phase Wagner motor are shown diagrammatically in Fig. 5. The stationary field is fed with single-phase current; the rotary is wound similar to an ordinary direct-current machine, and is provided with a commutator. The brush-holder has four arms provided with brushes, these four

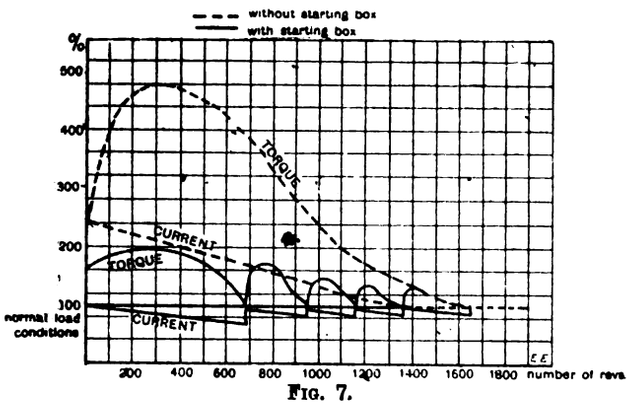

FIG. 7.

arms being spaced 90deg. Two neighbouring brushes are short-circuited so that the armature windings are connected in parallel-series. In starting the motor, the field is closed by means of a double-pole switch and the motor starts quickly, although loaded, and, as soon as it has reached a certain speed, all segments of the commutator are short-circuited by means of a very ingenious mechanism. This device has the advantage of keeping the exciting current of the motor within very small limits, and the mechanical construction of the motor, especially that of the short-circuiting device, is shown in Fig. 6. The commutator, as shown, consists of an annular ring instead of a cylindrical surface, and the brushes are placed horizontally and are shifted laterally, and the shifting of the brushes, and consequent short-circuiting of the commutator segments, is produced by means of the shell, S, which can be displaced along the axis, and is moved by means of the centrifugal regulator, W. Very little sparking accompanies the starting of this motor, and the operation of the shifting device is very reliable.

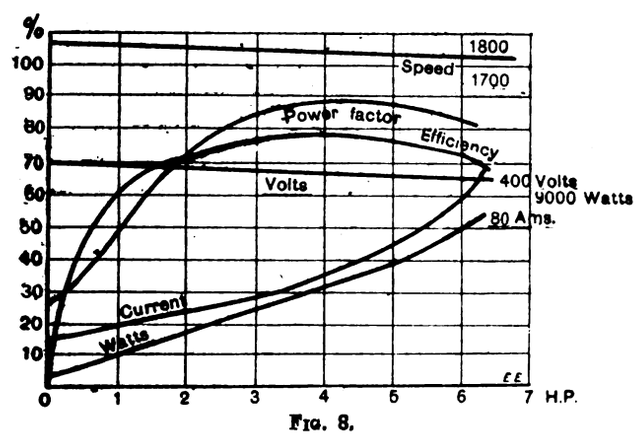

FIG. 8.

The Wagner Company builds this motor in sizes from ¼ h.p. to 35 h.p., to be connected directly on single-phase lighting lines. These motors have met with great success in the States, and are not only used in single-phase installations, but are very often connected to one phase of a three-phase circuit. The wear and tear of the commutator is very small, as the motor is running most of the time with the armature short-circuited and the brushes removed. No replacing of the commutator has been necessary on the motors that have been in regular service for six years, and, in recognition of these excellent results, the Wagner Electric Company was recently granted a medal by the Franklin Institute, Philadelphia. The accompanying curves (Fig. 7) show the results obtained with a 3-h.p. motor. Using speed as abscissa, the ordinates are plotted showing the torque and consumption of current under all conditions of normal load; the solid curve shows the result of using a non-inductive starting box, and the dotted curve is obtained without the use of a starting box. The motors will start with an overload of 40 to 50 per cent. Fig. 8 shows the speed, power factor, efficiency, watt consumption, and current consumption of several motor sizes operating under a given voltage. The transformers (Fig. 4) are used to supply the arc lamps installed on the Exposition grounds. This

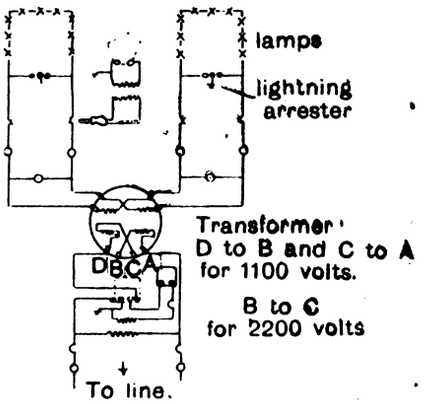

FIG. 9.

system differs materially from the European practice, and some detailed information may be of interest: The lamps are connected in series in groups of 30 to each circuit, and at the present time there are four circuits; the transformers regulate for constant current and variable voltage in the secondary circuit. The diagram of connection (Fig. 9) shows the manner of connecting the transformers and lamps; the lamps consume $6\frac{6}{10}$ amperes with a pressure on the arc of 72 volts, and they are provided with a small starting resistance and an automatic short-circuiting device to cut out the lamp in case of accident to the coils

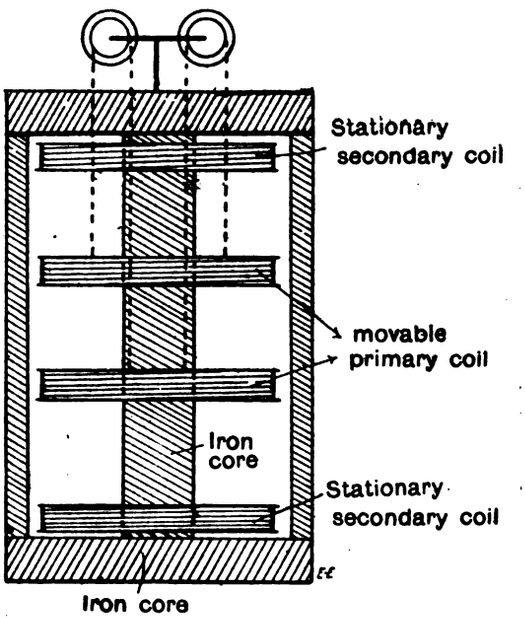

FIG. 10.

or of extinguishing of the arc. The vibrations produced in the iron cores of the coils are absorbed by a small blade spring of phosphore-bronze to which the cores are attached, and this system of connecting arc lamps in series is extensively employed in the States. The transformers are, of course, designed for constant current, and are constructed in different ways according to the size and the methods of cooling; the small types have a stationary primary coil, whereas the secondary coil is suspended and balanced by a counter-weight. The transformers illustrated in Figs. 4, 9, and 10 are air-cooled; the secondary coils are placed at the two extremities, and are stationary, while the primary coils, seen in the middle, are movable; the movable coils are

Digitized by Google

balanced one against the other, and a variable weight serves for balancing the repulsive force between primary and secondary coils. The intensity of this repulsive force depends on the current flowing in the coils, and the intensity of current may therefore be increased by adding weight, or decreased by decreasing weight. The transformers regulate from one-third to full load within one-tenth of an ampere, and the efficiency varies according to the size from 94·6 to 96 per cent., and the power factor from 0·77 to 0·78, and these transformers are often built for 10,000 volts. The transformers employed in the World's Fair station can be either connected to 2,200 volts or 1,100 volts across the primary (see diagram of connection, Fig. 9). A switchboard is furnished with each transformer, and this switchboard is, as shown in Fig. 5, connected mechanically with the transformer. The peculiar switches used with these panels, and serving for making the different connections, should be noticed; the connections being made by introducing a 250mm. copper rod into a brass tube (see Fig. 4). In order to make the necessary connection, 12 of these rods must be put in place; this is certainly not very practical, and besides the disadvantage of this feature, there is a possibility of the switchboard attendant touching the bare rod, and thus coming into contact with the high-tension circuit. The switchboard instruments are installed upon a marble plate supported by an iron frame, and bare live parts either on the front or on the back side of the switchboard are entirely avoided; the fuses are replaced by automatic circuit breakers, which have been perfected in this country to give great satisfaction. As lightning arresters three small bronze cylinders are used for each pole in this installation; these cylinders are 50mm. diameter and the same height, and are placed one after the other with an air-gap of 8/10mm. between the cylinders. The surfaces of these cylinders are not corrugated, and in addition suitable carbon resistances are placed in the grounded circuit.

TRACK CONSTRUCTION, WITH SPECIAL REFERENCE TO RAIL JOINTS.

BY F. H. DAVIES.

The great comparative weight and speed of electric tramcars has introduced problems into track design that were undreamt of by the permanent-way engineer of 30 years ago, and these difficulties have not been lightened by the necessity of maintaining all the rails in perfect electrical contact. Track construction of the present day is the outcome of years of experience, and as such has become to a great extent standardised, generally differing only in such details of weight and measurement as are compatible with the use the track is to be put to. An unfortunate exception to this is the gauge. While the majority of tramway systems in this country have been put down to the usual 4ft. 8½in. gauge, there are many, chiefly, however, of old design, that differ from this figure. Three feet six inches seems to be the gauge that finds favour next to the above, then 4ft. and 3ft. Glasgow stands by itself with a gauge of 4ft. 7¾in. The reason for the very wide divergence of opinion on this subject is difficult to see; presumably the adoption of anything under 4ft. 8½in. is on account of narrow streets necessitating narrow cars, and this appears to be the only valid reason, or, at any rate, the only one that is worth consideration.

The appearance of cars of a narrow gauge is certainly not attractive, and the gears and motors are apt to be somewhat more cramped than is desirable. Fortunately, practice seems to be levelling itself down to the 4ft. 8½in. measurement, and as ideas on standardisation are at the present time so strong, it may almost be confidently expected that this gauge will shortly be used to the exclusion of all others, with the possible exception of the 3ft. 6in. for special purposes. That all-important item of track construction, the rail, has passed through many stages both of shape and composition. Originally — that is to say, after wooden rails had had their day—it consisted of a plain cast-iron strip, 4in. wide, spiked on to a parallel wooden track in 5ft. or 6ft. lengths. Naturally this system had many faults, the chief of which were fragility and troubles caused by the great number of joints. To get over these faults, the rails were next made of wrought iron, and in longer lengths. Tramway affairs remained like this for some considerable period, until finally they were made commercially possible by the introduction of the rolled-steel girder rail, which has apparently come to stay; as for the last 25 years the improvements that have been made in it, although important, have merely been in details, such as shape and chemical composition, to suit various requirements.

The chemical composition of a steel rail naturally has a very great bearing on its life, electrical resistance, and general utility. Some authorities have advocated a comparatively soft and ductile rail, while others—and at the present day the majority—prefer one containing a larger percentage of carbon, and therefore of a harder nature. This percentage varies according to the weight of the rail per yard, and the best practice seems to determine it at from 0·35 per cent. for a 50lb. rail to 0 55 per cent. for a 100lb. These figures are the minimum and maximum extremes respectively for the weights quoted, and rails of intermediate weight should have a proportionate percentage, as, for instance, a 60lb. to 70lb. rail 0·38 to 0·48 per cent., and an 80lb. to 90lb. 0·43 to 0·53 per cent. A greater proportion of carbon than this tends to make the rail very brittle, and consequently liable to fracture. In America, however, this percentage has been considerably increased for heavy rails, as in cases Harveyised steel has been used showing in a 100lb. rail as much as 0·76 per cent. at the surface. With this type of rail no doubt this high percentage is practicable, as it applies only to the surface, which has a good backing up of more ductile metal, with the consequence that the rail is not particularly brittle as a whole. However, with the usual rail, such a percentage in the light of ordinary experience seems to invite disaster, and it would be interesting to hear what results have been obtained with rails of this description. An increase of carbon and hardness naturally goes hand in hand with an increase of electrical resistance. This, however, is not a matter of great practical importance, as considerations of wear and brittleness confine the proportions of carbon used, and consequently variations of the electrical resistance, to a very small range. Phosphorus as a constituent is not desirable, as it tends to increase brittleness. The average percentage is about 0·06 per cent., and it should never exceed 0·1 per cent. Sulphur is very undesirable, and should be kept as low as possible, as it has the effect of making the rails seamy. Silicon produces compactness and density in the metal. It increases the resistance of the rail in a greater degree than carbon, and in proportion should never exceed 0·2 per cent. Manganese very largely increases the specific resistance and causes crystalisation in the rails if present in excess. Its presence is, however, necessary in the manufacture of steel, and it is generally found in the proportion of from 0·7 to 1·1 per cent.

The jointing of rails is a subject upon which there seems a wide divergence of opinion, some—chiefly in this country—adhering to the usual form of joint made with fish and sole plates, and others—chiefly in America—to the cast-welded or electrically-welded joint. Whichever system is in use, too much care cannot be expended in the design and making of joints. The noise created by all electric cars when running at any speed is chiefly caused by pounding at the rail joints, and besides being objectionable from this point of view, this pounding is the cause of rapid depreciation at the rail ends and trouble with the bonds and joints. It also causes the concrete bed on which the rails are laid to wear away, and in this manner depreciation goes on with compound interest, so to speak. It has been suggested that a way out of this trouble would be to instal a split or double rail, so arranged that the joint of one half of the rail would be situated opposite the centre of the other half. While this system would undoubtedly reduce the pounding and noise, it seems scarcely practicable on the score of expense, not only with regard to first cost, but also maintenance. There would sure to be trouble with the two halves of the rail opening out, and consequent expense

Digitized by Google

would be incurred by the necessity of frequently pulling up the bolts.

To completely get over pounding, creeping of the rails, and consequent trouble with the joints and bonds, there is only one method, and that is to make the rails continuous by the aid of the above-mentioned cast-welded or electrically-welded joints. It has been, and is still, urged against this system that expansion and contraction due to changes in temperature are bound to produce buckling and general destruction of the road paving In practice, however, this has not been found the case to any serious extent, the reason undoubtedly being that the rails are held too firmly to allow of any great movement, and that, unlike railway track, they are to a great extent protected from variations of temperature by being almost entirely covered by the road paving. This latter is a point that has to be borne in mind when comparing the actions of railway and tramway lines. The result of temperature variation on a welded rail is, therefore, chiefly confined to molecular alterations and strains in the rail itself. That these strains are great there is no doubt, but that they do not exceed the tensile strength of steel is certain; and as the tensile strength of a good cast-welded joint is practically equal to that of the rail, and sometimes, as has been proved, even superior to it, there appears to be but little foundation for the fears that are entertained by some as to the effects of temperature variation. It is, of course, impossible to provide against flaws in the rail or joint, and in cases where fracture has occurred through cold it has been generally traced to this cause. If an expansion slip joint is placed about every 500ft., the fear of warping or fracture may be entirely dismissed. At crossings and the like it is necessary to securely anchor the nearest joint, as otherwise there is danger of the rails being pulled out of alignment by temperature changes.

The process of making the Falk cast-welded joint is roughly as follows: The rail ends and sides are scraped bright either with emery cloth, or preferably by a sand blast. This is very necessary, as the least oxide or scale interferes greatly with proper amalgamation. A tight-fitting cast-iron mould is now placed round the joint, and a cap on the top of the rail to protect the surface. The molten metal, consisting generally of a mixture of 50 per cent. hard silicon pig, 25 per cent. soft, and 25 per cent. scrap iron, at a considerably higher temperature than is usual in casting, is now poured in. The metal cools rapidly on the outside surface in contact with the mould, and there forms a scale. The web of the rail being thin is rapidly brought to a white heat, and fluxion ensues, thus making a perfect mechanical and electrical joint. To ensure perfect amalgamation, it is necessary for the rail to be scrupulously clean, and the metal to be of the right composition and poured at a very high temperature. It is also advisable to heat the rail ends slightly before pouring. When the joint is cooled, in a few minutes, the mould and cap are removed and the top of the rail filed smooth. The usual length of this joint is 14in., and the weight of metal used varies with the size of the rail from 70lb. to 140lb. It has been feared that the great heat to which the rail is subjected by this system would have the effect of annealing it at the joint. However, trouble in this direction does not appear to have arisen in practice. As an additional precaution, and in order to give the joint an even better hold on the rail than it gets by amalgamation, short iron plugs are sometimes inserted through the web close at the ends of the rails. These plugs fit tight in the rail, and, being finally embedded in the casting, have a good grip on it, and take most of the strain off the amalgamation.

The electrically-welded system is scarcely through the experimental stage, and is subject to the great objection that it is rather costly and necessitates cumbersome and expensive plant to perform the operation. Doubtless for this reason the cast-welded joint is much more prevalent, producing as it does a practically equal effect at a lower cost. When either of the above joints is used, bonding—that is, across the joints—becomes unnecessary, as the joint is electrically continuous and of practically equal conductivity to the rail. The usual cross bonds between the two rails of the track are, however, of course still necessary. This abolition of joint bonds is a great point in favour of the welded system. As the process is somewhat expensive, especially when carried out in a small way, there is practically no saving in capital cost, but maintenance has generally been found to drop considerably. A case in point that may be quoted is that of the French line between Lyons and Oulling, where the maintenance fell from £200 per kilometre per year to £4 after the introduction of the Falk cast-welded joint. This saving was, of course, not effected on bonding only, but there is no doubt it played a considerable part in it.

There are a great number of varieties of ordinary bonds, most of which attain the end of making good electrical contact between the rails in much the same way, the differences lying in methods of fixing to the rails and allowing for expansion and contraction. It is this last point, combined with the effects of pounding and vibration, that causes all the trouble with bonds working loose. It is obvious that, to be successful under these trying conditions, a bond must possess a very firm and permanent grip, that at the same time must introduce practically no resistance into the electrical circuit. The necessity of a good return path for the current is well known, and what has probably drawn most attention to it is the destruction by electrolysis of metal pipes in proximity to the track that has been frequently observed where the return circuit has not been all that it should be. With good bonding this trouble disappears to a great extent, and it is necessary, therefore, always to instal a type of bond which possesses all the above advantages. On the face of things, the welded bond, consisting of a corrugated copper strip welded to the ends of the rails, would appear to answer the purpose very well; but the trouble with this type is that under ordinary working conditions it is impossible to be certain of a good weld, and consequently the contact has frequently a higher resistance than it should have; also the cost of applying these bonds is very great. Much the same objections apply to the soldered contact bond, which consists of two large copper lugs connected together by waved copper wires. The continual vibration and movement of the rails in time has a very bad effect on the soldering, and the cost of installation is heavy. What is termed the "plastic bond" has been introduced as a solution to these difficulties, but, although possessing many good points, it has never been taken up to any very great extent. In the Edison-Brown plastic bond—about the only one in use at the present time—electrical continuity is preserved by the fishplates, the joint between them and the rail being made electrically perfect by a plastic metallic composition. These bonds have been very satisfactory when properly applied, but great care is necessary that the contact surfaces of the rail and fishplates are perfectly free from scale or rust, and properly amalgamated by the Edison process before application of the compound. A good feature is that they simplify track construction and maintenance by reducing the parts at the joints that are likely to go wrong to a minimum. Another example of the plastic bond is that in which continuity is maintained by a plate of copper placed under the fishplates, through which latter set screws are passed to keep the plate in tight connection with the rails. The contact surfaces are amalgamated by a good conducting plastic alloy. This bond allows free movement of the rail by providing what is practically a lubricated conducting surface, which is certainly an ingenious idea. It has been proved, however, to have several defects, the chief of which are varying and sometimes high resistance and rather heavy initial cost.

The mechanically attached copper bond seems to be the one most in favour, and the results obtained by some of the best makers are very satisfactory. The "Neptune" bond, made by Messrs. Felten and Guilleaume, may be cited as an example. It consists of a drop forged copper rod with an expanding slotted lug at each end. These lugs are passed through holes in the web of each rail, and expanded by steel drift pins driven in on the same side of the rail as the bond is inserted, as shown in section in Fig. 1. The great feature of this bond is that the driving in of the steel pin opens out the slotted ends on the far side of the rail, thus forming a shoulder and making it impossible for the bond to work loose even if the pin is

Digitized by Google

withdrawn. By the great pressure exerted the copper is naturally forced into complete and permanent connection with every part of the hole in the rail. This bond is easily and quickly applied, and is cheap in first cost. It has been made more flexible, and therefore improved, by the substitution of stranded wire or several waved copper strips for the solid bar; in the latter case it is, however, still drop forged out of one piece. The protected rail bond manufactured by the Forest City Company is another first-class variety. It is a flexible bond composed of a number of flat copper strips less than ¼in. wide, provided with U bends so as to take up all movement or vibration; these strips are fused to solid copper terminals, which are expanded by a special arrangement into the holes in the rail. These bonds are placed under the fishplates, hence their name, and it is claimed for them that owing to their shortness and position the result is a joint of very low resistance and cost.

The requisites of a good bond are, firstly, that it should have ample but not too great contact surface with the rail. A small contact under high pressure is preferable to a large area under a lower pressure, as in the latter case damp is apt to get in and cause corrosion. It is most important that the bond should have the most intimate connection with the rail possible, and that the pressure should be sufficient to force the copper into even the minutest irregularities in the surface of the hole. Where the pressure is distributed greatly, this becomes impossible.

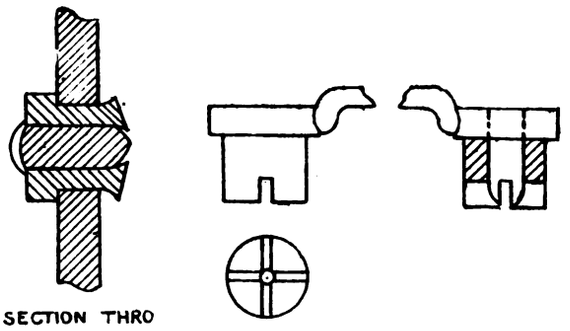

FIG. 1.

Secondly, the bond should be composed of one metal only—that is to say, in the conducting path—and that metal should be one that will not corrode by contact with the rail. Thirdly, it should preferably be made in one solid piece, but if this is not possible, as is frequently the case with flexible bonds, the terminals should be welded on. Fourthly, the lugs that make contact with the rail should be as simple as possible, and not composed of many parts, as each joint introduces a certain amount of resistance into the circuit. The lugs should invariably be expanded in, under as great a pressure as possible, and it is desirable that they should possess when fixed some form of shoulder, like the "Neptune" bond, which reduces risk of working loose to a minimum, and greatly takes up the strain of vibration and expansion from the contact area.

As regarding the fixing of bonds, it is necessary that all contact parts should be scrupulously bright, clean, and dry, and for this latter reason bonding should not be done in wet weather if possible. It is not advisable to use oil as a lubricant when drilling the holes in the rails for the reception of the bonds, as there is sure to be a film left that will for a time increase the resistance.

THE MODERN EQUIPMENT OF DOCKS, WITH SPECIAL REFERENCE TO HYDRAULIC AND ELECTRIC APPLIANCES.*

BY WALTER PITT, M.I.C.E.

Fifteen years ago Lord Armstrong, speaking in a discussion at the Institution of Civil Engineers, said "He felt satisfied that in point of safety, controlability, and adaptability for various purposes, electricity had little chance of ever rising to the level of hydraulic power." In the interval that has elapsed an immense change has taken place, the electric transmission of power is rapidly superseding all other methods, and nowhere is the change more marked than in the equipment of docks. It was the requirements of docks that first caused attention to be paid to the production of a practicable method of distributing power over a large area, and resulted in the evolution of the hydraulic system of power distribution, a system which has for many years been worked out with such thoroughness, and which has done such excellent work, that a modern hydraulic dock plant had come to be considered as almost beyond criticism, and yet at the present moment we may say that he would be a more than conservative engineer who would seriously recommend the adoption of a complete hydraulic equipment in a new scheme of any magnitude.

In dockyards we find in every direction, and separated often by considerable distances, appliances that require power to drive them. In the warehouses there are cranes, travellers, and lifts; on the quays there are jib cranes, capstans, and coal tips; and about the entrances and locks there are sluice-lifting gear and gate winches; in addition, there are generally workshops, sometimes on a very complete scale; and last but not least, the whole place has to be lighted at night. All these duties have to be performed in the first place effectively, and, in the second place, economically. The first thing is always to do the work well, rapidly, continuously, with the minimum of stoppages and breakdowns, and also with the minimum of skilled attention; the second consideration is to do all this at the minimum of cost, giving due weight to first cost, upkeep, and working expenses.

It cannot be denied that the hydraulic appliances that are to be found in a well-equipped dock fulfil admirably all that can reasonably be demanded of them with regard to those requirements that I have put in the first line, and which arise from the point of view of the man who merely has to use the machine and not to provide and pay for it. In spite of this, however, we find that a rapid change is taking place, although, as usual, we have allowed ourselves to lag somewhat behind our neighbours, and if we turn to the Continent we find that the change over from hydraulic to electric appliances about docks is becoming almost universal. I need only mention, amongst others, Hamburg, Rotterdam, Genoa, Bremen, Naples, etc. If we look for the reason of this change, we soon find it. The electric transmission of power can do everything that the hydraulic transmission of power can, and a great deal more besides, and it does it at a cheaper rate. With the same set of engines and boilers every appliance that requires power can be driven, the workshops can be kept running and the docks can be lighted, and there is that combination of a day and a night load which is dear to the heart of every electrical engineer.

In the restricted limits of this short opening paper it may be as well to give a few words to the most important of dockyard appliances, the crane. In respect of first cost, probably there is not very much difference between the cost of an electric and of a hydraulic crane installation. The electric crane is in itself more expensive than the hydraulic, the electric generating plant is perhaps slightly cheaper than the hydraulic power generating plant; but in the case of the connecting link between the power-house and the cranes we find an immense advantage on the side of the electric leads as compared with the cost of hydraulic mains. When we look at the efficiency of the crane as a machine, we find that the electric crane easily surpasses the hydraulic; the quantity of cargo loaded or unloaded for every electrical horse-power delivered at the crane is greater than that for a hydraulic horse-power.

In a paper by Mr. Philip Dawson, A.M.I.C.E., in *Traction and Transmission* for May, there are some interesting data on the power required by electric cranes in loading and unloading vessels at Continental ports, with comparative tests between electric and hydraulic cranes when working under exactly similar conditions, and I have also, through the courtesy of Mr. Baxter, the mechanical engineer of the Clyde Navigation, been given the results of a test made

* Paper read before the Engineering Conference of the Institution of Civil Engineers.

Digitized by Google

at Glasgow on March 19 and 20 last. The two cranes at Glasgow work side by side. One is a compound five-ton and three-ton hydraulic crane, and the other is a three-ton electric crane by Stothert and Pitt. The work is precisely similar, the hydraulic and electric cranes having in the previous 13 months discharged and loaded about 41,000 tons and 44,000 tons respectively. The cycle at the test was:

Lift	30ft.
Slew	100deg.
Lower	10ft.
Lift (empty bucket)	10ft.
Slew	100deg.
Lower	30ft.

Mr. Baxter gives the results reduced to cost of power delivered at the crane per 1,000 tons of cargo unloaded. I have analysed the figures on a similar plan to that adapted by Mr. Dawson, and have reduced them to equivalent watt-hours per cycle, with the following results:

	Load— 1 ton.	2 tons.	2½ tons.	3 tons.
Hydraulic crane	236·7	236·7	236·7	236·7
Electric crane	83·3	160·4	197·9	241·9
Ratio H/E	2·84	1·47	1·2	0·983

The foreign test given by Mr. Dawson tells the same story, but comes out a good deal better for the hydraulic, as the crane was a triple compound; the cycle was a somewhat longer one, the lift being 36·1ft., the lower 13ft., and the slew 140deg. The respective watt-hours per cycle are:

	Load. ½ ton.	¾ ton.	1 ton.	1¼ tons.	1½ tons.
Hydraulic crane	82·0	127·2	127·2	172·4	172·4
Electric crane	48·5	58·5	73·5	80·5	105·5
Ratio H/E	1·69	2 17	1·74	2·15	1·63

We thus see that in these two independent tests the hydraulic crane power consumption varied approximately between one and three times that of the electric crane per cycle of operations.

The question of the relative cost of the watt-hour delivered to a crane on either system will no doubt be dealt with in the discussion. As a basis of comparison, we may remember that electricity at 1½d. per unit is the mechanical equivalent in foot-pounds, or watt-hours, of pressure water at 9·8d. per 1,000 gallons, or 5s. 1d. per 1,000 cubic feet, the pressure being 750lb. per square inch, and we must also remember that we have to deal with the cost of power delivered at the work after allowing for all losses in transmission. But there is an aspect of the case that would carry the day in favour of electricity, even if the cost of working were slightly more, instead of less, and this is the extreme flexibility of the system, the great ease with which extensions can be carried out, and entirely different classes of work performed. An isolated machine can be placed in a remote corner, and there is no trouble in getting power to it economically; there is a general adaptability that quite turns the scale in favour of electricity, and it does not freeze up in winter.

Space will not allow me to go into descriptive details of particular machines on either system, but with regard to electrical appliances it may be said that a thoroughly satisfactory system has been produced. There is, however, still the battle of multiphase *versus* continuous current to be fought to a finish, and no doubt points of detail will be much modified and improved in the future—*e.g.*, the last word has not yet been said about controllers and resistances, especially capstan controllers; but, taken as a whole, the electric equipment of docks is here and has come to stay.

Summarising my argument: (1) the first cost of an electric installation is not more than that of a hydraulic plant; (2) the cost of up-keep is no more; (3) the electric machines are more efficient, and take less power for the same work done; (4) the power is less costly to generate; (5) the transmission losses are less; (6) the general adaptability is incomparably greater.

Discussion.

Mr. A. B. Ellington said it was really somewhat difficult to take Mr. Pitt quite seriously. He began by quoting Lord Armstrong, and with regard to safety and controlability Lord Armstrong was right then, and no doubt would be right now if he cared to express an opinion. He agreed that there was no power which was available for use which had the same adaptability as electricity. He contended that in the case of docks the adaptability of hydraulic power was sufficient. He then proceeded to deal with the figures mentioned in the paper in order, he said, to show that from his point of view nearly every argument that had been put forward in the paper was wrong. The 1½-ton hydraulic crane was put at 172 watt-hours per cycle, but he was quite sure there were plenty of makers who would be quite willing to put up cranes which would not consume more than 120. The amount of the electric crane was 105, but he did not think that would be anything like realised in ordinary practice. To attain it at all there must be some very special circumstances by which the very high efficiency could be obtained, and the motors must also be extremely efficient. There was no reference at all to the accumulator, which was the foundation of the hydraulic system—it was like criticising the play of "Hamlet" and leaving the character of Hamlet out of it. No speeds were given, and no rates of efficiency could be worked out satisfactorily, but he was quite sure he was within the mark when he said that the lifting of that crane ought to be done in under 15 seconds. They heard that the first cost of an electric installation was no greater than that of the hydraulic. He submitted that if the figures were properly compared, and if the hydraulic power was properly put down, having regard to the way in which the maximum efficiency of hydraulic machines could be obtained, then that was also untrue. He asserted that every electrical engineer who was dealing with that question was seeking to get something as good as hydraulic. There was an extreme discrepancy in coal consumption between electrical power and hydraulic. The reason for the greater economy was to be found in the hydraulic generating plant being worked at a varying speed at a varying load, but that every electric plant had to work at a constant speed at a varying load, so that the economy of the hydraulic plant was very much greater than that of the electric. He said that there had been some carelessness in presenting the paper in that form. Of course Mr. Pitt was an enthusiast, and he was very interesting, and would like to have a nice discussion and all that, but on p. 2 he said: "With the same set of engines and boilers every appliance that requires power can be driven, the workshops can be kept running and the docks can be lighted, and there is that combination of a day and a night load which is dear to the heart of every electrical engineer." It sounded nice, but it meant nothing.

Mr. Cecil Brown said he felt it incumbent upon him to speak as there had been such an attack on the paper. He was asked last year to prepare a scheme in connection with a Bill to equip in an up-to-date manner a harbour and docks, and he thought it was desirable to go thoroughly into the question of equipment almost before the building of the dock, and he advised the promoters that he thought it would be better to consider the equipment first and make that thoroughly efficient, and just spend what money they had left in making the dock. He did so, because he thought it was better to have a smaller dock thoroughly equipped than a larger one not so thoroughly equipped. He found it pretty much as that paper stated: that the cost of electric installation was pretty much the same as that of hydraulic, and there was one point in which it was ever so much better. He made an estimate for the electrical equipment, and as the Bill was before Parliament, he might just state that the cost would be £24,000 for the plant and £10,000 for the generating plant. He believed Sir Leader Williams had some electric cranes working on his canal, and he thought if the fairies could give him a wish, it was that the whole of that canal should be worked by electricity at the present moment.

Mr. Baxter, Mr. Stokes, Mr. G. H. B. Homfray, Mr. J. M. Dobson, Mr. P. Sothert, Prof. Jameson, Mr. C. J. Hobbs, Mr. B. J. Arkwright, Mr. J. C. Dove, and Mr. Robson having spoken, Mr. Pitt replied.

RADIUM AND OTHER RADIOACTIVE SUBSTANCES WITH A CONSIDERATION OF PHOSPHORESCENT AND FLUORESCENT SUBSTANCES. THE PROPERTIES AND APPLICATIONS OF SELENIUM AND THE TREATMENT OF DISEASE BY THE ULTRA-VIOLET LIGHT.*

BY WILLIAM J. HAMMER.

(Continued from page 864, Vol. XXXI.)

There are also many insects, such as fireflies and glow-worms, and many deep-sea fishes, which have the properties of producing phosphorescence. Phosphorescence is exhibited among other animals by the infusorian noctiluca, marine radiates, polyps, etc., which are the principal causes of phosphorescence of the sea. In Fig. 1 is shown an illustration of the Pyrophorus Noctilucus. This tropical beetle has been most carefully studied by Prof. S. P. Langley and F. W. Very, and the efficiency of the light given off tested by the Langley bolometer; and they have demonstrated that practically all the energy which its phosphorescence represents appears as light; and the light given off by this insect is the most

* A lecture delivered at a meeting of the American Institute of Electrical Engineers and the American Electrochemical Society, New York, April 17, 1903.

Digitized by Google

efficient light known, it being produced at about one four-hundredth part of the cost of the energy which is expended in the candle flame.* Sir Oliver Lodge says if the secret of the firefly were known, a boy turning a crank could furnish sufficient energy to light an entire electric circuit. And Prof. Langley says: "There seems to be no reason why we are forbidden to hope that we may yet discover a method (since such a one certainly exists and is in use on the small scale) of obtaining an enormously greater result than we now do from our present means of producing light." Langley believes the light of these insects is due to chemical action, as it is decreased by nitrogen, which checks combustion, and is increased by oxygen, which increases combustion, and furthermore, the product is apparently carbon dioxide. We also may produce phosphorescence by rubbing crystals together, or by friction of other bodies, or by cleavage, such as fracture of lump sugar in the dark. Among plants, phosphorescence was first recorded by A. Linnæus, whose daughter discovered it in the nasturtium. Phosphorescence or flashes of light are often observed, especially just after sunset, in the common red and yellow marigold, the tuberose, sunflower, poke weed, martagen lily, and the poppy. The root stock of khus-khus grass and the sap of certain tropical vines and subterranean plants, some liverworts, ferns, mosses, fungi and algæ, and the mycellium of fungi in decaying wood phosphoresce. This phosphorescence is said to be due to slow decay and oxidation, either in the mycelia or fructifications of the fungi. Heat and dryness soon dissipate it.

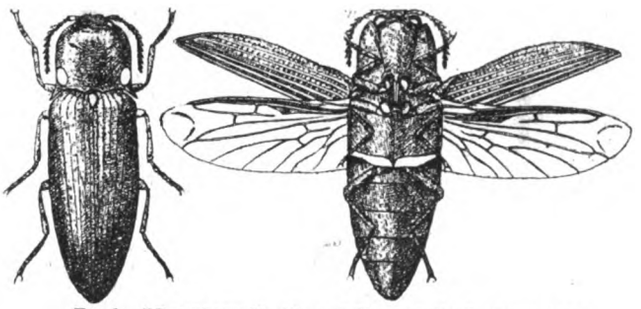

FIG. 1.—"Pyrophorus Noctilucus" (life size), the Producer of the Cheapest Form of Light Known.

Having considered certain of the phenomena of phosphorescence and fluorescence, I wish now to call your attention to these remarkable substances which have recently been discovered, which give off light the moment they are created, without having to be stimulated by any form of heat, light, electrical, or other vibrations, so far as we are at present cognisant of, and these substances are attracting a great deal of attention, and are likely to teach us more about the constitution of matter, and the co-relation of the vital and physical forces, than any substances which have been created since the world began. I refer to "radium, polonium, actinium, and thorium."

RADIUM AND OTHER RADIOACTIVE SUBSTANCES.

To the discovery of M. Henri Becquerel, member of the Institute of France, in 1896, of those remarkable radiations emanating from uranium, the science, if we may so term it, of radioactivity owes its foundation. Great importance must, however, be attached to the previous investigations into the phenomena produced on the interior and exterior of vacuum tubes of various kinds by such men as Varley, Hittorf, Crookes, Lenard, Röntgen, Hertz, J. J. Thomson, Goldstein, Schmidt, Ebert, Wiechert, Geissler, Kaufmann, Puluj, Perrin, Villard, Wien, Wiedemann, Majorana, Birkland, Deslandres, Poincaré, Edison, Tesla, Rowland, Michelson, E. Thomson, Moore, Rollins, Campbell-Swinton, and others, which investigations had already wrested from Nature so many secrets bearing upon the constitution of matter and paved the way for the Becquerel rays. Two important links in the chain were supplied by the experiments of M. Henry† and M. Niewenglowski.‡ The former showed that phosphorescent sulphide of zinc penetrated black paper and affected a photograph plate, similar to Röntgen rays, and the latter in his experiment replaced the usual cover of a loaded photographic plate holder by a thin sheet of aluminium, on top of this he placed four glass squares sprinkled over with sulphide of calcium, rendered phosphorescent by exposure to sunlight. A jeweller's glass bell jar was put over each plate, and the whole apparatus was then placed in a dark room for 23 hours. On developing the negative, the plate showed an excellent image of the squares of glass and the bell glass covers which had been made through the aluminium, a substance heretofore supposed to be entirely opaque to light; the white line shown bordering the squares of glass (where the plate had not been affected) indicated that the rays had here been bent or refracted in passing through the edge of the glass, demonstrating that he was only dealing with ordinary light rays. Subsequently Prof. Becquerel investigated the effect of phosphorescent substances on photographic plates covered with black paper, such as is used for covering X-ray plates, and which while transparent to X-rays is impervious to ordinary light waves (a plate so protected may be left in the sunlight for 24 hours), and he exposed various uranium salts to sunlight to try their effect, at times placing an aluminum, copper, or glass plate between the paper and the photograph plate or film. On one occasion after he had placed some double sulphate of uranium and potassium on a photographic plate the weather became stormy, and he placed his plate with the uranium salts upon it in a drawer, where it remained for several days on account of continuance of the cloudy weather. It then occurred to him to develop the plate, and much to his surprise he found a well-defined impression upon the plate, and this caused without any effect of phosphorescence due to exposure to sunlight. This led to his discovery and investigation of the remarkable radiations which have since been known by his name.*

I have here some samples of the first substances employed by Becquerel, consisting of double sulphate of uranium and potassium and double sulphate of uranium and ammonium, for which I am indebted to the courtesy of Dr. C. F. Chandler, of Columbia University. Peligot, in 1840, succeeded in isolating metallic uranium from the chloride. Well-known forms of it are also uranium arsenate, uranium carbonate, uranium niobate, uranium phosphate, uranium silicate, and uranium sulphate. Uranium was first discovered in 1789 by the German chemist Klaproth, he naming it after the planet "Uranus." I have here various forms of this uranium, and also some metallic uranium prepared in the electric furnace by Moissan, which is more powerful than any other form of uranium. Uranium, although widely distributed, is never found in large amounts, and forms several minerals. The commonest of these is "uraninite," commonly known as "pitchblende," which is a compound oxide containing 81½ per cent. of uranium, 4 per cent. of lead, and ½ per cent. of iron with oxygen and water, and sometimes magnesia, manganese, or silica. The pitchblende which contains the largest percentage of radioactive material which has thus far been discovered is the Bohemian pitchblende. It is also found in Saxony in small pockets, and a distinct vein of it has been found in Cornwall, England. Prof. Curie informed the writer that he had secured some excellent radioactive pitchblende from the United States (Colorado). The ore as mined in Cornwall yields 18 to 20 per cent. of the metal, this being the most important source, and this is usually put on the market in the form of uranium sesquioxide, and is largely used for giving porcelains a velvety black when heated in the annealing fire, and to some extent for imparting a greenish-yellow fluorescence to glass. It has also been suggested to use it on account of its high resistance in connection with incandescent lighting

Following the original discovery of the Becquerel radiations in 1896 came the discovery in 1898 of "polonium" by Prof. Pierre Curie and Mme. Sklodowska Curie, who in investigating Becquerel radiations from uranium found

* "On the Cheapest Form of Light," by S. P. Langley and F. W. Very, No. 1,258 Smithsonian Misc. Coll.

some samples of pitchblende, from which the uranium is extracted, which was much more powerful than any uranium they had found, being four times the radioactivity of metallic uranium. Concluding naturally that the Becquerel radiations were due to some unknown substance in the pitchblende, they commenced a most painstaking search for it, and discovered a substance associated with bismuth, which it resembled very much in its chemical characteristics, to which Mme. Curie gave the name

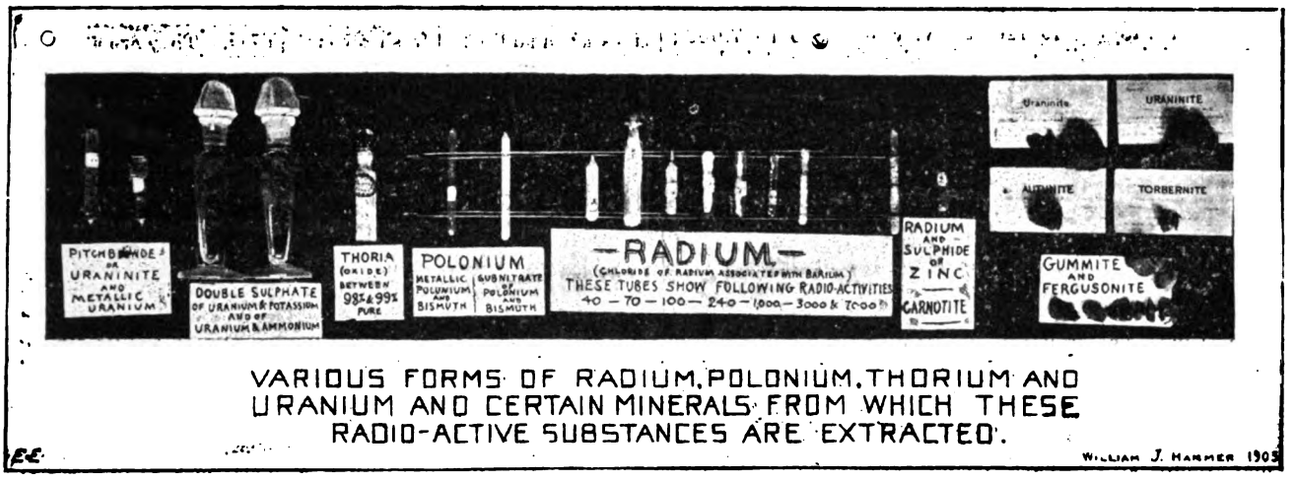

FIG. 2.—Radioactive Substances.

"polonium," after her native land, Poland. I have here, perhaps, the only sample in this country at present of metallic polonium, which in colour resembles somewhat the particles of nickel; and here also is some sub-nitrate of polonium. Where substances are referred to as possessing a certain "radioactivity," for instance, 300, it means that the radiations are 300 times as powerful as the original radiations emanating from uranium, which were discovered by Becquerel, and which are taken as a standard of comparison. The two tubes which

M. Bemont, succeeded in isolating a second substance found in pitchblende, which was associated with barium and possessed many of the chemical and other characteristics of that substance, and to this they gave the name "radium." Of this we shall treat later. In 1899 was discovered the third substance in pitchblende, which possessed the chemical and other characteristics of thorium with which it was associated, and to this Debierne gave the name "actinium." It is precipitated by ammonium sulphhydrate. Crookes states that actinium is identical with

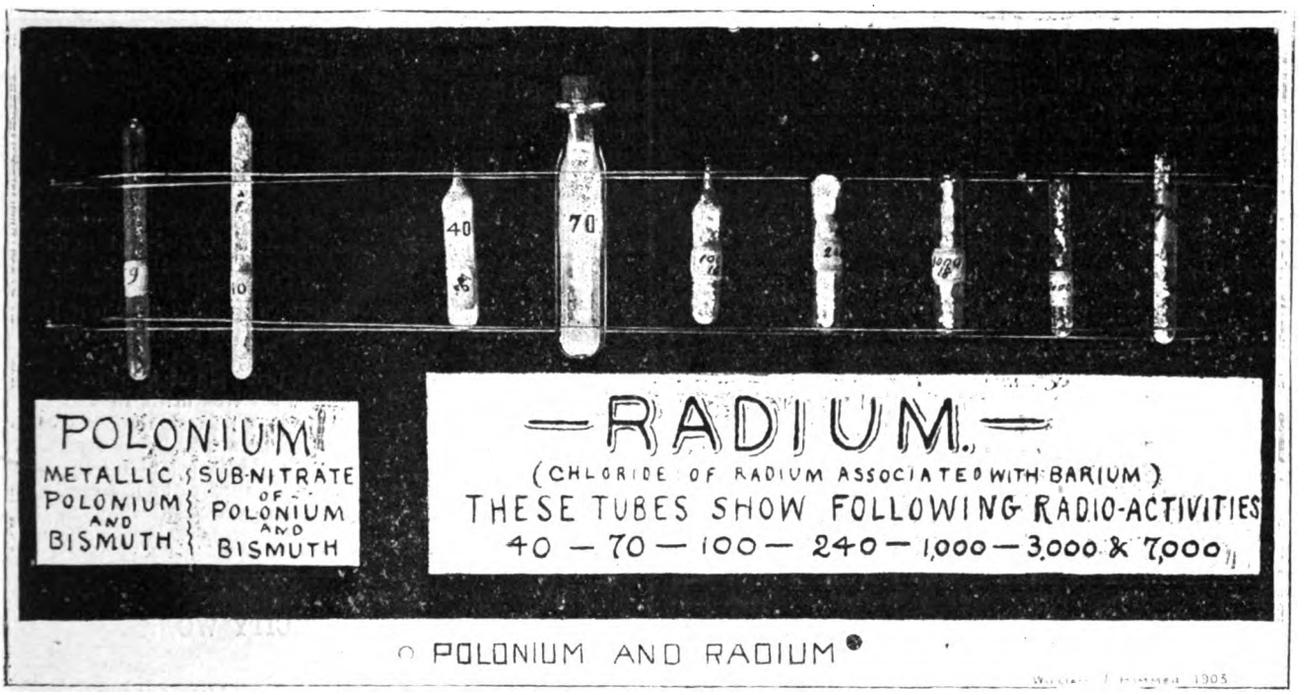

FIG. 3.—Showing Two Tubes of Metallic Polonium and Bismuth and Subnitrate of Polonium and Bismuth, and Seven Tubes of Chloride of Radium and Barium in the possession of the Author. (About two-thirds natural size.)

I have here to-night are of the sub-nitrate and metallic form, and possess a radioactivity of only about 300. The sub-nitrate form is a white powder, and the metallic, as said, resembles in appearance particles of nickel. Polonium is precipitated by hydrogen sulphide. Polonium apparently loses its power much more rapidly than radium, and the Curies have not been able to prepare any in which the rays have been deviable, although Giesel has prepared a form possessing both deviable and non-deviable rays; and Elster states that when polonium is placed in a vacuum the rays may be deviated by a magnet to a greater extent

the substance which he had isolated from uranium, and to which he gave the name "uranium X." The rays from actinium are deviable. Of the three substances to which I have referred, radium is by far the most important, and is of extraordinary interest. It is doubtful whether any substance has been discovered in the history of the world of such stupendous interest and importance and possessing such puzzling characteristics as radium, which seems so at variance with well-established scientific theories as to the constitution of matter. In Fig. 2 are shown in consecutive order from left to right a tube containing pitchblende, or

Digitized by Google

uraninite, from which radium, polonium, and actinium, as well as uranium, are extracted; a tube containing metallic uranium made in the electric furnace by Moissan; two flasks containing double sulphate of uranium and potassium, and double sulphate of uranium and ammonium, these being the original salts of uranium with which Becquerel experimented when he discovered the Becquerel rays; a tube containing thorium, the most radioactive substance next to radium; two tubes of polonium and bismuth, one tube of metallic polonium and the other sub-nitrate of polonium; seven tubes of chloride of radium associated with barium ranging in radioactivity from 40 to 7,000; a tube containing radium and phosphorescent sulphide of zinc; and a tube containing carnotite, which, together with the samples shown of uraninite, autunite, torbernite, gummite, and fergusonite, are among the mineral substances which are rich in radioactive materials. Other active minerals are orangite, euxenite, broggerite, cleveite, monazite, samarskite, xenotime, æschynite, niobite, arrhenite, hielmite, sipilite, chalcolite, etc. In Fig. 3 the two tubes of polonium and the seven tubes of radium are shown about two-thirds their natural size. Radium, actinium, and polonium, Prof. Curie states, possess an activity which is a million times that of uranium. Prof. Curie says radium emits exactly the same quantity of Becquerel rays when in the liquid air as it does at normal temperature of the atmosphere. The luminosity of the chloride of radium is stronger in the liquid air than in the atmosphere at a normal temperature. My friend, Mr. R. R. Bowker, whom I met in Paris last fall, told the writer that he had shortly before that been dining seated between Lord Kelvin and Prof. Becquerel, and that Lord Kelvin had turned to him and said that the discovery of Becquerel radiations had placed the first question mark against the principle of conservation of energy which had been placed against it since that principle was enunciated.

(To be continued.)

TRADE NOTICES AND NOVELTIES.

Dick, Kerr, and Co.'s Modified Standard Car.

Messrs. Dick, Kerr, and Co., Limited, have recently delivered to the Leicester Corporation a sample car, built by the Electric Railway and Tramway Carriage Works, Limited, Preston, Lancashire, which embodies some features that are new and important in railway car construction. These features are principally an improved method of ventilation and an improved design of interior finish, which, taken together, have produced a very satisfactory car, and one which is a long way in advance of what has come to be universally known as the "Preston standard top-seat car." The provision made for ventilation will be readily understood from the annexed diagram, which shows a cross-section of a top-seat tramcar roof constructed to provide for an inlet of fresh air, and an outlet for the foul hot air that ascends to and fills the upper part of the car. The inlet for fresh air is provided for through the usual line of hinged windows placed above the large fixed glass windows universally used in recent tramcar work. These hinged windows were first adopted by, and have since become an essential feature of, the Preston standard top-seat car. They are shown in the diagram at the points marked A A, and the circulation of the air that takes place from the outside into the car is shown by the arrows marked B B. These hinged windows, which are arranged in the outside walls of the car on each side, have proved to be the best means for the admission of fresh air into the car that has yet been devised, and they have been universally copied by all the principal car-builders throughout England in tramcar work. With the use of these windows experience has shown that the only thing wanting for thoroughly ventilating a tramcar was some provision for a further supply of fresh air from the outside into the car, and a means for the escape of the foul hot air which ascends to the roof, and which cannot get out without interrupting the current of fresh air passing into the car through the hinged windows already referred to. This increased supply is provided for by a hinged sash on each side of the end door in each end of the car, marked on the diagram F F. These sashes can be opened in exactly the same way as the sash, A A, at the sides when additional fresh air is required. They are also provided with perforated louvre panels, G G, on the outside, and being in the end of the car they admit of a large supply of fresh air passing into the car without interfering with the arrangement of coloured signal lenses, and without allowing the admission of water in wet weather. The outlet for the foul hot air has been provided for by a recess made in the roof of the car, marked C C, and which, as shown in the diagram, is just above the hinged windows above referred to. The circulation of the foul hot air through this recess to the outside is shown by the arrows marked D D. On the outside of the car on each side and connecting with this recess are fixed ventilators, marked E E, constructed in such a way that no air can pass into the car at these points, but the ventilators are exhausting, or drawing, the hot air out when the car is running. It will be noted that this recess, C C, not only connects direct with the interior of the car, but that it also connects with the roof space, H H H, between the millboard ceiling and the main deck, and that this space, which in ordinary tramcars is a dead air-space without means of escape, is thoroughly ventilated by this arrangement. If required, a further outlet for the hot air in the top of the car may be provided for by perforating the millboard ceiling to connect with this space and indirectly with the ventilators on the outside of the car. It will also be noted that this exhaustion of the air by the ventilators through the recess and roof space is not arranged with any means for preventing their action, and the escape of the foul hot air continually taking place. The effect of this construction and arrangement of ventilation is that the interior of the car is constantly provided with a circulation of fresh air into and the foul air out at the points named, absolutely without dangerous or annoying draughts. The application of this principle of ventilation to the car lends itself to a very satisfactory treatment in the way of interior design and general finish, which adds very largely to its appearance. The accompanying illustrations clearly show this. The woodwork connected with the interior finishing is done in oak and mahogany, and, as the illustrations show, has been treated in an entirely new and original way, much to the advantage of its general appearance.

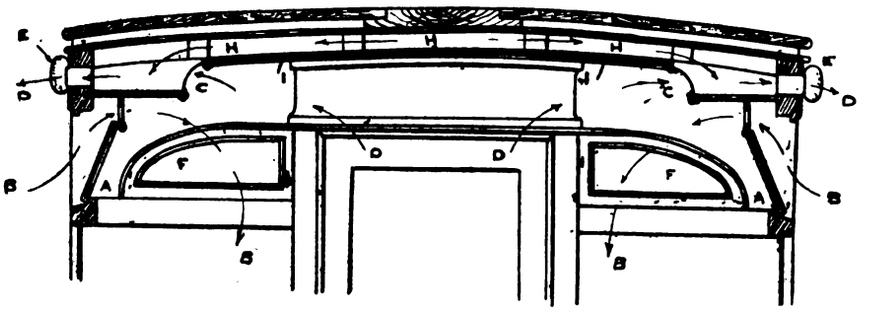

Diagram showing Method of Ventilation—Dick, Kerr, and Co.'s Modified Standard Car.

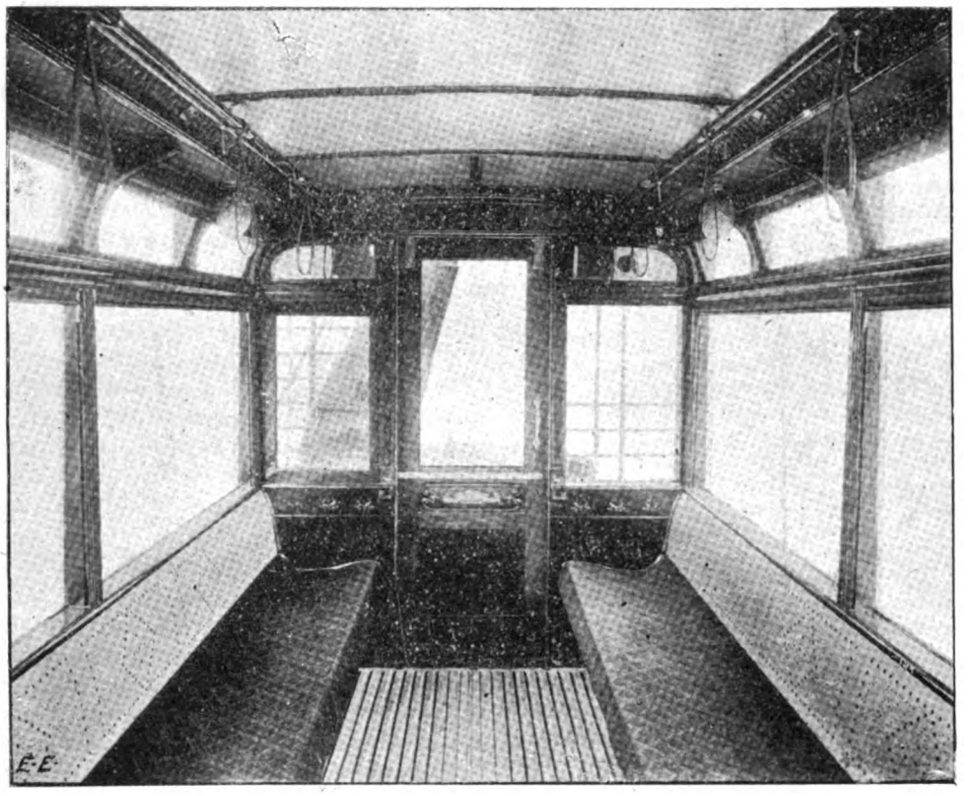
DONCASTER ELECTRICITY WORKS.

The engineer's report on the third year's working of the electricity department of the Doncaster Corporation to March 31 last has just been issued. It states that at the beginning of the first year (April 1, 1902) the amount of capital expended was £45,727. During the year a further amount of £8,748 has been expended, bringing the total expenditure at the end of the year to £54,475. 13s. 1d. The increase in the amount of plant installed in the power station during the year was 220 kw. This is entirely taken up by the power required for the tramways. Part of the capital expended was to compound the then two largest dynamos in the station in order to make them serviceable for supplying both the traction and lighting loads. The fuel economiser, too, has given very satisfactory results in the saving of fuel, and from the results up to the present the undertaking promises to pay for itself in two or three years' time. The condensing plant was not completed before the end of the year, and had not then started working, but the great benefit of this will be marked in the next year's working. The

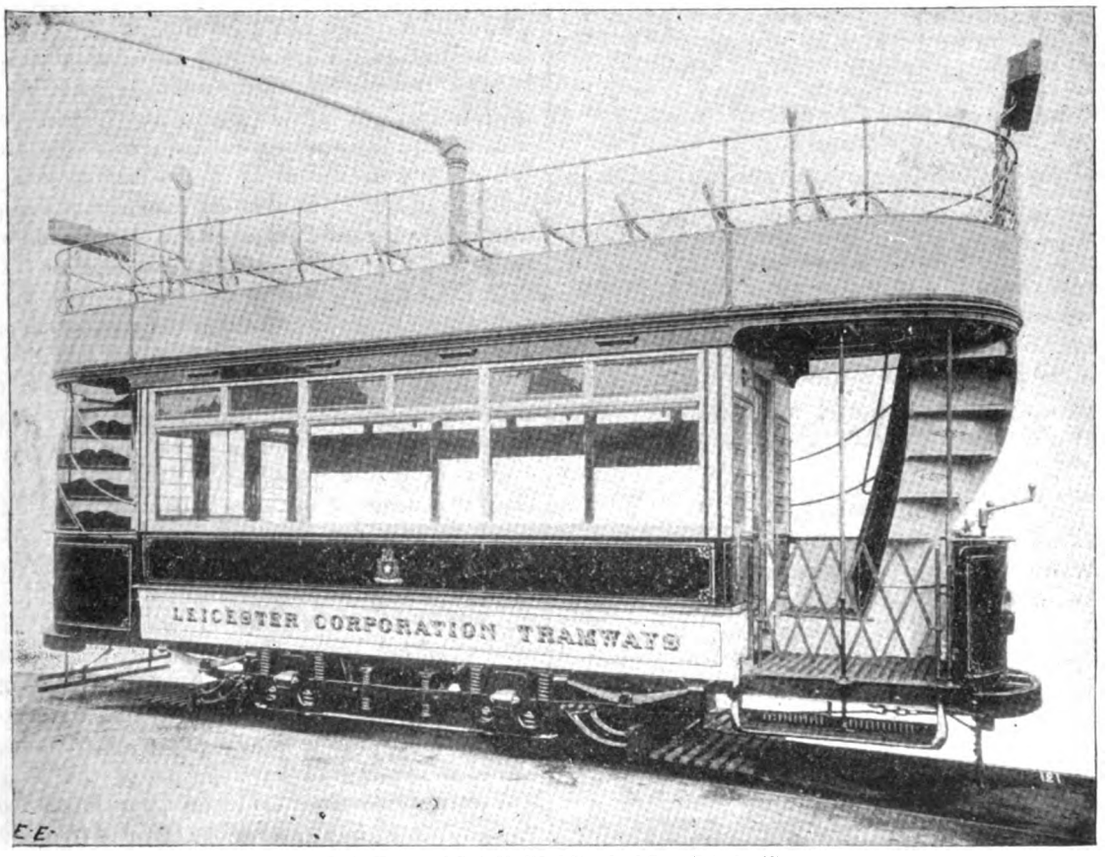
Digitized by Google

progress of the connections of consumers has been satisfactory. The number of consumers at the end of the year was 258, and the number of lights (8-c.p. lamps) 20,344. The motors connected



Dick, Kerr, and Co.'s Modified Standard Car—Interior View.

numbered 26, with a total horse-power of 166·5. The number of units sold was 139,458 for lighting, 31,107 for power, 238,640 for traction—total, 409,205. The number of units generated was 478,699. The total revenue amounted to £24,484. 14s. 3d., and the expenditure



Dick, Kerr, and Co.'s Modified Standard Car—Exterior View.

to £22,755. 1s. 3d., leaving a gross profit of £1,729. 13s. The average price per unit obtained was 2·54d. The price obtained for lighting alone was 4·45d. per unit. The maximum load on station in kilowatts was 510·5. With regard to the gross profit (£1,729. 13s.), after paying all charges on working costs there is this surplus available to go towards paying off interest and sinking fund. Although this is not sufficient to meet the capital charges, yet it is considerably more than was available from the previous year's working, showing an increase of 387 per cent., and promises well for the department soon being able to be considered as a paying concern. In conclusion, Mr. W. Wyld expresses his best thanks to the whole of the committee for the support they have given him in the various suggestions he has from time to time brought forward, and trusts that the results may be such as to not only fully justify the support which they have given him, but to thoroughly satisfy the committee that they have been material in assisting to make the undertaking a successful one.

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Bound Volumes of "THE ELECTRICAL ENGINEER," containing half-year's copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, July to December, 1902, now ready.

PROGRESS.

It has been our custom for some years past to *report* the annual meetings of the Verband Deutscher Elektrotechniker. As reward we have on several occasions had the satisfaction of bringing to the knowledge of our readers important developments or inventions, details of which had been purposely reserved for publication at these meetings. This year's proceedings, according to the account rendered by our correspondent, the introduction to which has already appeared in these columns, were marked by the absence of any very special announcements. That great development which the Germans are craving to instil into their industry, fresh vigour and prosperity, seems as far off as ever, and the situation consequently remains depressed. It is not so much from the lack of orders as from the unremunerative prices obtained that the electrical industry in Germany is suffering. Over-capitalisation and the too hasty extension of works have been chiefly responsible for the trouble, but, fortunately, most of the concerns involved have been of sufficiently stable proportions to endure, and can look to the future without much fear as to the outcome. The balance between productive capacity and normal demand has been severely upset, but is bound to be restored sooner or later as the natural consequence of an improving home market. Meanwhile, the capital invested yields but a poor return, and this is where the shoe pinches. In their distress the Germans have certainly proved themselves resourceful, and have met depression with effective means to prevent undue competition from within, besides endeavouring to obtain more economical production. In some cases amalgamations have been effected between large firms, and in others small firms have been absorbed by the large ones. In the Siemens-Schuckert combine we have an example of the former, and in the absorption of the electrical department of Gebr. Körting, Hanover, by the Allgemeine Elektricitäts-Gesellschaft, Berlin, a good instance of the latter case. One of the principal objects attained by the Siemens-Schuckert combine will be the concentration of the dynamo construction departments of the joint concern at Nürnberg, while the establishments in Berlin will be devoted exclusively to the manufacture of instruments, cables, etc. But not even commercial depression has been without its advantages to the German industry, if we are to take the president of the Verband, Herr Geheimerath Prof. Dr. Ulbricht, seriously. In his address the president pointed out that the prevailing commercial depression had enabled greater attention to be paid to scientific and technical problems, whereby the way was prepared for future material developments. As examples of recent progress made, Herr Ulbricht mentioned the use of induction coils coupled in series for compensating the capacity of telephone lines, thus enabling the voice to be clearly heard and understood over increased distances, and the extended use of the telephone in railway work. He referred also to the increased utility of asynchronous machines derived through improved methods of winding, and to the use of multiphase currents of different frequencies in the same conductor, which justified the hope of greater economy of transmission through long conductors. The successful production of nitrogen in a marketable form by electrical means, the development of the steam-turbine, and recent improvements in lamps, were further commented upon in turn. But whether our German friends are indeed justified in assuming that extra stimulus has been given to research by the prevailing lull in commercial activity is open to question, especially as the pioneering work in some of the directions indicated was initiated outside the Fatherland. However, that may be as it may, we should be the

Digitized by Google

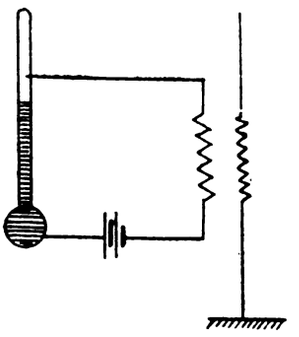
last to grudge them progress in the scientific development of their electrical industry, since we are all striving for the same end and greet progress irrespective of its source. Much as has been already accomplished, there remains more to be done, especially at the consumer's end of the transmission line. Take, for example, the question of lighting. No great stimulus has yet been given to electric illumination such as was given to gas by the Welsbach mantle. It may be that the Nernst lamp is yet destined to effect a general reversion to electric lighting, but the symptoms of rapid development are absent. Judging by casual observations, we should say that this lamp is gaining favour at a slower rate in Germany than here. Probably its slow evolution from the experimental to the commercial stage still has a retarding effect on its introduction. Greater initial cost, high minimum candle-power, and extra complexity as compared with the ordinary form of incandescent lamp, no doubt also stand in its way, but these objections will scarcely maintain a preponderating influence in face of the economy effected.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

WIRELESS FIRE-ALARM.

SIR,—Allow me to bring under your notice an application of wireless telegraphy which, however modest it may be, might be of real use. The invention has the object to call the fire brigade's immediate attention, automatically and without wires, to fire or to any dangerous rise of the temperature in the buildings where the apparatus is installed.



It consists of a mercury thermometer, in the bulb and tube of which platimum contacts are inserted. The contact in the bulb is placed at the degree where the temperature becomes dangerous. The contacts communicate with the ordinary wireless telegraphy apparatus. The transmitter, which consists of a special cog-wheel, transmits automatically the name of the street and the number of the house of the building in danger. The contact in the tube is not reached by the mercury as long as the temperature remains normal. When the apparatus is at rest, if the temperature rises to the critical point the mercury column touches the contact, the circuit is closed, and the transmitter sends the requisite information to the receiver. This apparatus should, it appears to me, prevent many a catastrophe by advising the fire brigade in good time. In the hope that you will allow me space for the above in your columns, I have the honour to remain—Yours, etc.,

EMILE GUARINI.

RE COMPOUND WINDING.

SIR,—Does Mr. McCausland ask this question in a spirit of sarcasm, since an answer more enigmatical would be difficult to conceive? Taking the answer as it stands, it is full of untold possibilities, for a motor which, under ordinary circumstances, requires less current with increased load has yet to be designed; and a *motor* giving an increased E.M.F. under load is indeed a *rara avis*.

To see what really takes place in a compound motor when loaded, we may first consider the case of a simple shunt motor. When the armature of the motor revolves due to the reaction between the current flowing in it and the lines of force generated in the field, it is at the same time acting as a dynamo, and a back E.M.F. is induced, proportional to the speed, in accordance with the equation

$$E = E_1 - C R_a,$$

where E = back E.M.F.;
E_1 = E M.F. supplied to motor terminals;
$C R_a$ = volts drop due to armature resistance.

This equation may be said to govern the behaviour of the motor when under load. For suppose that due to an increase of load, the speed is momentarily reduced; then E in the equation, being proportional to the speed, is decreased. But as E^1 is supposed constant, and R_a is constant, the armature current must increase, and in doing so supplies the torque necessary to overcome the increased load. Hence we see that for a shunt motor an increase of load results in a larger armature current and slightly decreased speed and back E.M.F.

It is easy to see how the addition of series coils on the field magnets will modify the above conditions. As before, due to increased load, the armature current will increase, and consequently also the current in the series coil. The field by this means being strengthened, a large torque is exerted, tending to pull the motor up to speed again. The compound-wound motor therefore occupies a place intermediate between the series motor and the shunt motor. It has to a greater or lesser extent, depending upon the nature of the compounding, the advantages peculiar to the series motor—viz, a larger starting torque without excessive current—but due to the variation in the field, it has not the constancy of speed for which shunt motors are usually designed.—Yours, etc, L. D. WAINWRIGHT.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

599. Describe the electrical equipment necessary for a large 500-volt electric crane to lift, say, 50 tons, preferably a travelling crane, with special reference to the method of starting and controlling.—D. R.

600. Distributors run along a main road, and a consumer's residence is situated 180 to 190 yards up a side road, which is a public bridle path and footway. Is it legal to charge the consumer for the whole cost of such main, or would he come under the Board of Trade minimum charge clause of the provisional order—*i.e.*, "to pay in the aggregate for a supply of energy for three years a sum not exceeding 20 per cent. upon the cost of laying such distributor to the nearest available source of supply"?—H. F.

ANSWERS.

Question No. 589.—A shunt-wound 500-volt four-pole motor drives the circulating pump of a surface condenser, and as this motor is semi-enclosed, the two bottom sets of brushes are difficult to get at for cleaning purposes, etc. It is now proposed to use two sets of brushes only instead of four. What alterations must be made to the armature in present use? and if an entire new armature is necessary, show exactly how it must be wound.

Answer to No. 589 (*awarded 7s. 6d.*).—Unfortunately "R. M." has not in his question specified the manner in which the present armature of the motor is wound, whether ring or drum; or, if the latter, whether lap or wave. It is therefore difficult to answer the question in its present form directly, or to do more than just consider some of

Digitized by Google

the general principles involved in the problem for the most probable cases. An easy means of identifying the winding of a drum armature may perhaps be mentioned—namely, by simple inspection of the top layer of end connections at the two ends of the armature. In the common form of straight-out end connections of the armature coils of a wave winding the wires at one end are parallel with those at the other end, so that any one wire is connected at, say, the pulley side to another wire under the next pole, which wire is in its turn connected on the commutator side to a wire under a still further pole, whereas in the case of a lap winding the wires of the top layer of end connections at the two ends, if produced, would meet at approximately 90deg., and any one armature wire is connected to two *adjacent* wires under the next pole, instead of two wires under different poles.

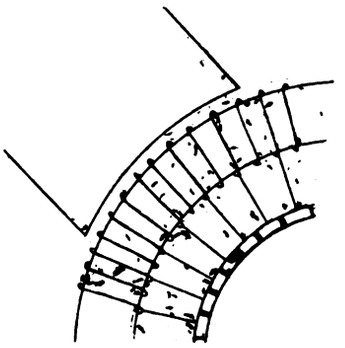


FIG. 1.

The various ring windings may, perhaps, be dismissed from consideration; these windings have been pretty extensively used in the United States, but are now, in this country at least, the exception rather than the rule. In any case the remarks which apply to the lap winding will generally apply also to the ring winding, if the latter is wound as a continuous ring, such as is shown diagrammatically in Fig. 1; while in the less general case, when the coils under any one pole are connected to the coils under another pole of the same polarity, as in Fig. 2, the winding may be looked upon as being very nearly equivalent to a wave-drum winding; the winding of Fig. 2 when completed would have 13 coils (on the six-pole machine), re-entrancy being attained at the end of the fourth complete encircling of the armature. The simple winding of Fig. 1 properly requires four brush sets, spaced equally round the armature, while the series winding of Fig. 2 requires only two sets placed at 90deg. apart, but may be run with four sets if more convenient.

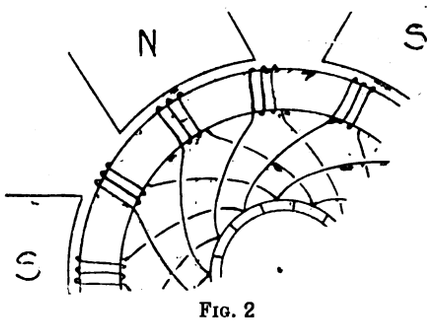

FIG. 2

Motors for 500 volts are very usually wave-drum wound. A simplex wave winding, of two possible circuits only, may be used and run with either two or four sets of brushes; to enable a shorter commutator to be used, one half the brushes may be taken from two spindles and placed on a second pair of spindles, the commutation and current collection being unaffected. A winding of this type for a four-pole machine is partly drawn in Fig. 3. It has 14 face conductors, and re-enters on itself after encircling the armature three times. If the armature is coil-wound, the dotted lines indicate the position of the coils at the commutator end of the machine, the full lines representing the connecting wires from one coil to another, with a junction at the commutator segment. With such a wave winding, should there be four brush sets used at present, and should the commutator be of ample length parallel to the shaft, in order to run with two brush sets it would simply be necessary to increase the brush collecting surface on the two spindles to double the present area to ensure normal conditions for collection and commutation.

Assuming, now, that the motor has a lap-wound armature—that is, that the connecting wires at the commutator end of the coils, instead of going forward to a conductor under the next pole (as in Fig. 3), return, after connection to the commutator segment, to the next conductor or coil under *the same* pole, the last wire being finally joined to the first after one complete round of the armature, or, less probably, after two rounds, or even three. This form of winding has commonly as many brush sets as there are poles on the machine, and in a four-pole machine the current will thus have four distinct paths through the winding—namely, from the two positive brushes to the

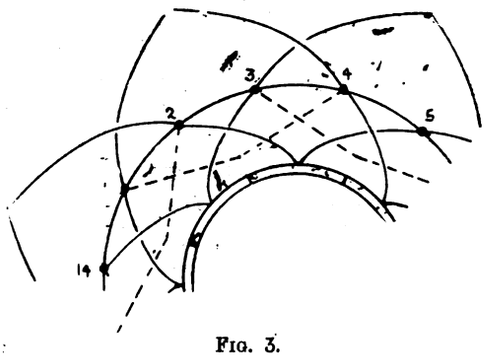

FIG. 3.

two negative. Ordinarily, a motor so wound, unless with a cross-connected commutator, could not be satisfactorily run with two brushes.

The simplest means of adapting a four-pole lap winding for running with two brush sets would probably be to carry out a system of cross-connections; the number of segments in the commutator being divisible by 2, each segment must be connected to the segment immediately on the opposite side of the commutator by a wire of a sectional area double that of the present armature wire, the operation probably necessitating the dismantling of the commutator and its rebuilding. Once carried out, a pair of doubled brush sets 90deg. apart will now fulfil all the functions of four brush sets spaced equally round the commutator, the heating, speed, and sparking conditions being quite normal.

Should it be thought advisable to strip the armature, and rewind as a wave winding to run at the same speed and voltage and with two brush sets, it will be necessary to halve the number and double the section of the armature wires when winding as a simplex two-circuit winding.—E. W. S.

Answer to No. 589 (*awarded* 7*s.* 6*d.*).—There are two methods of connecting up the conductors of a multipolar drum armature, commonly known as "lap" or "wave" winding. In the lap winding, the armature conductors are connected up into as many paths in parallel as there are number of poles; but in the wave winding they are always connected up into two paths in parallel independent of the number of poles. We thus see that with a given number of conductors on the armature the voltage generated by a wave winding will always be $\frac{\text{number of poles}}{2}$ times the voltage set up by a lap.

Figs. 1 and 2 give a diagrammatic view of the two windings, with the commutator spread out into a flat band. If the wave winding was applied to a four-pole machine, the commutators bars marked with an asterisk in Fig. 1 would be one and the same—*i.e.*, we should have gone all round the commutator. We can now see that the potential difference between each pair of commutator bars in the wave-wound armature will be twice, or $\frac{\text{number of poles}}{2}$ times that of the lap, since between them we have two armature coils in series instead of one. In a four-pole lap-wound armature, since there are four circuits in parallel, we must have four sets of brushes to collect the currents, but in a wave-wound armature, as we only

Digitized by Google

have two circuits, we need only have two sets of brushes. These two sets of brushes must, of course, be 90deg. apart as with a lap winding, but we can chose any convenient position we like for them—*e.g.*, at the top of the commutator—where they are easy to get at for cleaning purposes, etc.

We can, if we like, fit four sets of brushes to a wave winding thus filling up the intermediate commutator bar, A, in Fig. 1; the difference of voltage between it and the other set of brushes of like sign (which we will suppose to be on the commutator bar marked with an asterisk) can only be that due to one armature coil, which will not matter.

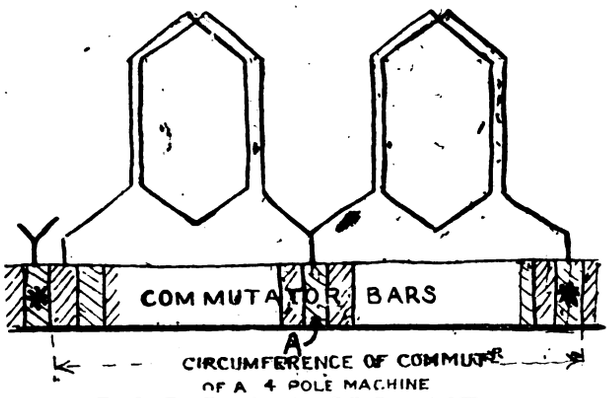

FIG. 1.—Two-Turn Armature Coils Connected Wave.

The only effect of doing this is to reduce the current density in the brushes, the voltage of the machine and everything else remains unaltered. In a wave winding, however, there is no tendency (such as there is in a lap) tending to make the current distribute itself evenly over the two pairs of brushes. We are thus liable at any time to find that one pair of brushes is taking all the current while the other is taking none at all. The use of four sets of brushes is therefore, we see, not of any very obvious advantage, since we must design them so that one pair is large enough to carry the full current. It has, however, been found that commutation is rather better with four sets of brushes than with two. The armature in question may, therefore, either be a wave-wound armature with four sets of brushes or a lap wound. If the former is the case, the two bottom sets of brushes may be removed at once, and the machine will still run as before. If the brushes show signs of undue heating, or the tips of the carbons become red hot, wider brushes should however be substituted.

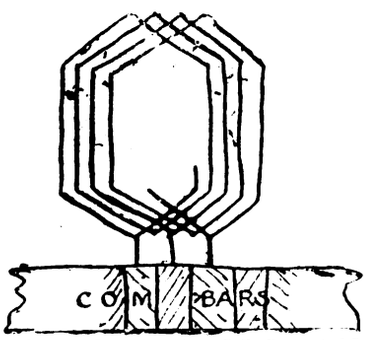

FIG. 2.—Two-Turn Armature Coils Connected Lap.

We can easily determine whether the armature is wave or lap wound by tracing out the connections of the two ends of any one armature coil to the commutator. If the two ends are connected to adjacent commutator parts, it is a lap winding; if to commutator bars 180deg. or two pole pitches, apart it is a wave. If lap-wound, we must disconnect all the armature coils from the commutator, and, after bending their ends into the correct shape, connect them up again as a wave winding. If the brushes of the machine are, when in their working position, nearly under the centres of the poles, the two ends of the armature coils will be of equal length, and, after being bent, will probably be of the right length for connecting up as a wave winding. If the length of the ends be insufficient, pieces must be brazed on, which is a very awkward job, so that it might possibly be cheaper to wind new coils. If it is decided to make new coils, only half the turns per coil should be used, as we have seen above that the wave winding gives twice the volts of a lap for the same number of conductors, the cross-section, therefore, being about twice that of the lap winding. If we can work in the old coils we must connect together the commutator bars in pairs, thus virtually making a double winding of it, or reducing the effective conductors by half, so that the armature still generates the same voltage, or if a motor runs at the same speed.—T. SQUARE.

Answer to No. 589 (*awarded* 5*s.*).—This question results in a discussion on the methods of winding armatures. Multipolar armatures are either parallel or series wound, or some modification of these systems. The parallel-wound armature has so many paths through it and as many sets of brushes as there are poles, and may be adapted to use two sets of brushes only by connecting together the equipotential points on the commutator. There would be as many of these points as there are pairs of poles. The connections could be made by means of insulated connectors (washers provided with lugs) strung on the shaft between the armature and commutator. The arrangement, however, is awkward, and takes up much valuable space on the shaft, besides necessitating a larger commutator, since the whole armature current, which was formerly divided between as many sets of brushes as there are pairs of poles, is now carried by one set, and to get the same brush contact surface as before a commutator of either larger diameter or greater length, or of both, is required. It may be concluded, then, that there is no really practical way of adapting a parallel-wound armature for the use of two sets of brushes other than rewinding as a series armature.

The series-wound armature has only two paths for the current round the armature, irrespective of the number of poles, and the potential across the brushes is the potential produced by half the total number of conductors on the armature, whereas in the parallel-wound armature the pressure across the brushes is the pressure produced by the conductors between any two poles, and hence the wire on a four-pole parallel-wound armature is just half the area of the wire on the same armature-wound series—*i.e.*, assuming same voltage and same speed. The fact that a thicker wire must be used on a series-wound armature is a great advantage in the smaller sizes of motors, whereas for a multipolar design the wire would be too thin for economic handling if the armature were parallel wound. (The series method is also used with moderate sizes of machines, in order that a bar winding may be utilised.) There is another advantage in using a two-circuit winding, which is this: good commutation may be obtained even when the armature is eccentric with respect to the field. This

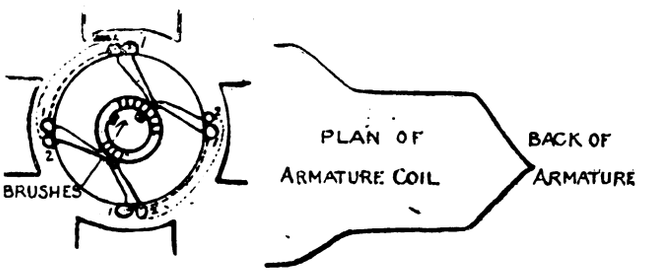

FIG. 1.—Series-Wound Armature, Wave Winding.

eccentricity, which would be produced by wear in the bearings, is disastrous as regards sparkless running in a parallel-wound armature. This, coupled with the fact that the brushes may be placed in an accessible position, is the chief reason for adopting the series type of armature in a tramway motor. But a series-wound armature is often provided with as many sets of brushes as there are poles, as this arrangement reduces the reactance voltage of the sections undergoing commutation, hence lessening the tendency to spark. The motor in the above question may be so arranged (being probably under 50 h.p. and working with a high terminal voltage), and if so, would run almost as well without the two lower sets of brushes as with them.

Fig. 1 is a sketch of a series-wound armature, showing two coils. The dotted lines represent the wire at the back

Digitized by Google

of the armature. The end connections are so bent that while the active conductors to which they are joined are 90deg. apart, the commutator sections which are connected to them are 180deg. apart—*i.e.*, for a four-pole machine. The brushes are 90deg. apart, and the number of commutator sections will be odd. Fig. 2 is a sketch of a parallel or lap wound armature, showing three coils. The end connections are bent so that while the active conductors

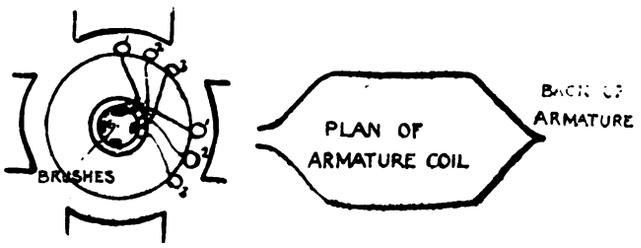

Fig. 2.—Parallel-Wound Armature, Lap Winding.

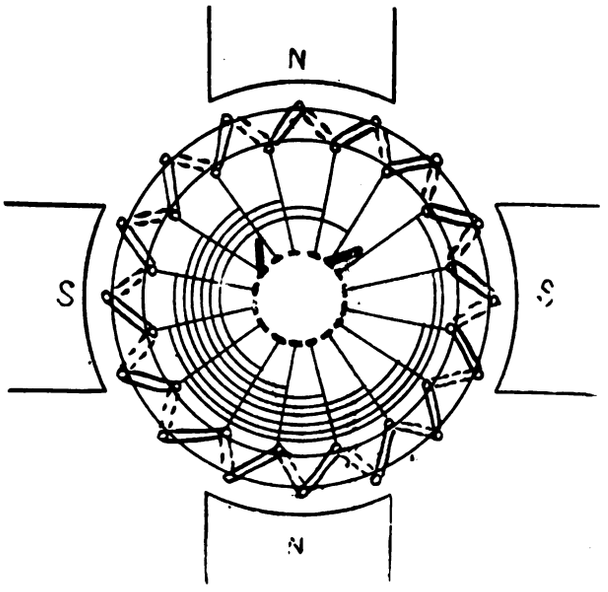
of a coil are 90deg. apart, their respective segments on the commutator are adjacent.—E. H.

Answer to No. 589 (*awarded* 5*s.*).—If the armature of the motor is a ring it will be possible to run with one pair of brushes, provided opposite parts of the winding are connected as shown in the accompanying diagram. These connections may be at either end of the armature, or, provided, of course, that there is sufficient room for the purpose, within the armature or the commutator. There are several windings for drum armatures in a four-pole field suitable for one pair of brushes. Without having more data than is given in the question it is impossible to give a scheme for rewinding, or to say whether the present winding could be utilised for the desired purpose. In any case it must be remembered that if one pair instead of two pairs of brushes be employed, the amount of current to be carried by each brush will be approximately doubled. This will necessarily entail a longer commutator when only one set of brushes are used, and it is quite possible that the construction of the motor will prevent any appreciable



lengthening of the commutator bars. "R. M." will do well to consider the propriety of fitting a more suitable form of brush-holder, or whether some alteration cannot be made to allow greater accessibility in cleaning and adjusting them than in making such a radical change in the armature. M. M.

Question No. 592.—Give an illustration of the methods adopted for determining the proper sizes of the cables for a three-phase combined lighting and power scheme for a large works, voltage between the phases 350, voltage between neutral point and any one wire 200 volts, length of longest feeder circuit 500 yards, maximum power in one feeder 50 h.p.

Best Answer to No. 592 (*awarded* 10*s.*).—In working out the size of alternating-current feeders, we must first of all know the frequency: for a combined lighting and motor system a frequency of 60 cycles ought to be very satisfactory where the circuits are not too long, remembering that arc lamps will not burn efficiently when the frequency is lower than 40. Having settled this point, the next three most important factors to be considered are: (1) the most economical conductor; (2) the permissible drop in pressure; (3) maximum current density permissible without undue heating.

The most economical feeder is given by Lord Kelvin's law: "The most economical area is that for which the annual cost of the energy lost just equals the annual interest on capital invested." The maximum drop of volts should never exceed 10 per cent. The current density limit is generally taken as 1,000 amperes per square inch of sectional area, or ·87 ampere per circular mil. In the present case the longest circuit is only 500 yards, so that our considerations may be chiefly governed by the maximum current density and the maximum drop of volts allowable. It might be well to mention here that for a three-phase four-wire system the weight of copper necessary is only 33·3 per cent. of the weight required on a single-phase two-wire system at the same minimum voltage.

For calculating sizes of cables for alternating work, the General Electric Company, of Schenectady, have issued some very useful sets of tables which are sufficiently accurate for most practical purposes. Of course, the losses due to induction will greatly depend on the distance between the lead and the return conductors. The following are general formulæ to be used:

$$\text{The area of conductor (circular mils)} = \frac{D\,W\,K}{P\,E^2}.$$

$$\text{Volts loss in line} = \frac{P \times E \times m}{100}.$$

$$\text{Current in main conductors} = \frac{W \times T}{E}.$$

$$\text{Weight of copper in pounds} = \frac{D^2 \times W \times K \times A}{P \times E^2 \times 10^6}.$$

In the above formula—

W = total watts delivered;
D = distance of transmission (one way) in feet;
P = loss in line per cent. of power delivered—*i.e.*, of W;
E = voltage between the main conductors at receiving end.

A, K, T, and *m* are constants given by tables, extracts of which are given below:

System.	Values of A.	Values of K. Per cent. power factor.				Values of T. Per cent. power factor.			
		100	95	85	80	100	95	85	80
Single-phase.....	6·04	2,160	2,400	3,000	3,380	1·00	1·05	1·07	1·25
2-phase 4-wire	12·03	1,080	1,200	1,500	1,690	·58	·53	·59	62
3-phase 3-wire	9·06	1,080	1,200	1,500	1,690	·58	·61	·68	·72

A. W. gauge of wire.	Values of *m* at 60 v. Per cent. power factor.			
	95	90	85	80
0000	1·62	1·84	1·99	2·09
000	1·49	1·66	1·77	1·95
00	1·34	1·52	1·60	1·66
0	1·31	1·40	1·46	1·49
1	1·24	1·30	1·34	1·36
2	1·18	1·23	1·25	1·26
3	1·14	1·17	1·18	1·17
4	1·11	1·12	1·11	1·10
5	1·08	1·08	1·06	1·04

The value of A is based on the fact that ·00000302lb. is the weight of one mil-foot of copper. For direct current K = 2,160, M = 1, T = 1. These calculations hold only for the three main conductors. The neutral wire may be made one-half or one-third of this size, or omitted entirely when the system is well balanced. This is not likely to be the case in the present instance. It is well to note that two wires in parallel have the same resistance and about half the reactance of a single wire of double the cross-section of either. Thus, replacing a No. 0000 wire by two No. 0 wires in parallel, the resistance, weight of copper, etc., is the same, but the reactance is lessened by about one-half. In the present case, line reactance and resistance should not account for more than about 5 per cent. of total power generated.—R. S.

Answer to No. 592 (*awarded* 5*s.*).—The determination of the correct size of cable for any electrical power transmission scheme, whether alternating or continuous current, comes down primarily, like most other things, to a question of cost. In this case we have two "losses" to consider: (1) the $C^2 R$ loss due to the resistance of the cable; and (2) the interest on the money which has to be sunk in order to buy the cables, and also the money which has to be put away in order to provide a depreciation fund, so that when after a period of years the cable requires renewing there shall be sufficient money in the fund to do it. We can, knowing the average "load curve" of the transmission line, at once calculate out the root mean square current during working hours, and taking this current the average $C^2 R$ watts which will be wasted in any particular size of cable. Knowing, also, the cost of production of electricity per Board of Trade unit at the power station, we can at once turn this loss into pounds per month or year, so as to be directly comparable with the other loss. That size of cable which gives the sum of these two losses a minimum is the correct size to use. Since both the resistance and the cost vary directly as the length, the best size of cable will evidently be independent of the length, but proportional to the current.

Mr. Ellis Crapper gives the following formula for determining the best section of cable to use in any particular case:

$$\text{Section in square inches} = \frac{\text{R.M.S. current in amperes}}{\sqrt{\left(\frac{\text{Working hours}}{\text{per year}}\right) \times \left(\frac{\text{Resistance of 1 mile of}}{\text{copper, 1 sq. in. section}}\right) \times \left(\frac{\text{cost per watt-}}{\text{hour in £}}\right)}{\left(\frac{\text{Wt. tons of cop. conductor 1}}{\text{mile long, 1 sq. in. section}}\right) \times \left(\frac{\text{price of copper}}{\text{cable, ton in £}}\right) \times \left(\frac{\%\ \text{interest}}{100}\right)}}$$

Let h = working hours per day;
n = cost per Board of Trade unit in pence:
σ = resistance of a copper conductor one square inch section and one mile long = ·045 ohm;
m = weight of a copper conductor one square inch section and one mile long, in tons = 9·1;
f = price of copper cable per ton in £;
p = per cent. of interest for capital spent on cables and for depreciation

$$= \frac{p}{100}$$

$$\text{Then section square inch} = C\sqrt{\frac{365 \times \sigma\, h\, n}{1{,}000 \times 240 \times m\, f\, p}},$$

or substituting for σ and m and simplifying

$$= \cdot00274 \times C\sqrt{\frac{h\, n}{f\, p}}.$$

Applying this formula to the example given, assuming that 30 h.p. is the root mean square load and 50 the maximum, we have (the transmission line being evidently a "star" grouping):

Line current per conductor

$$= \frac{\text{power}}{\sqrt{3} \times \text{line volts}} = \frac{30 \times 746}{1{,}732 \times 350} = 37 \text{ amperes.}$$

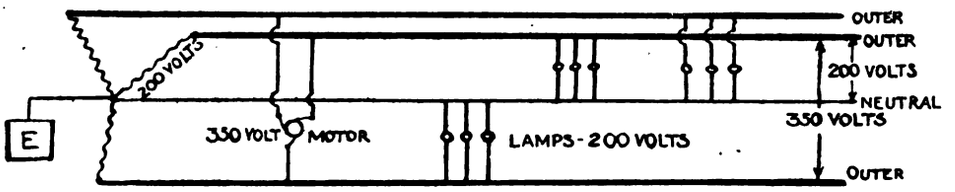
Assuming the line is used for 12 hours per day, that power costs 1d. per Board of Trade unit, that 8 per cent. on the cost of the cable is allowed for interest on capital and depreciation, and that cable costs £150 per ton, we have

$$\text{Section sq. in.} = 37\sqrt{\frac{12 \times 1}{\frac{8}{100} \times 150}} \times \cdot00274 = \cdot1015 \text{ sq. in.}$$

$$\text{Hence current density} = \frac{37}{\cdot1015} = 364 \text{ amperes per sq. in.}$$

This density is quite safe, since for maximum load it will only be $364 \times \frac{5}{3} = 606$ amperes per square inch. Sometimes, however, the density may by this method work out so high as to overheat the cable or cause too great a voltage drop along it for the maximum power. In these cases we must, of course, take a larger cable than that given by the formulæ.—T. SQUARE.

Answer to No. 592 (*awarded* 5*s.*).—The arrangement would be practically a four-wire system, with three outer wires and one neutral wire, this latter being connected to the centre point of the star machine windings and earthed. The motors being three-phase, and connected up between the three outer wires at 350 volts, and the incandescent lamps divided as equally as possible between the three outers and the neutral, the motor load, whatever its size, and however varied, will not then affect the balance of the system. The accompanying diagram shows the connections. It would be cheapest and best, from all points of view, to use four-core cables throughout. In calculating the size of cable, we shall require to know the amperes carried by each outer conductor, and this is found by the following formula:



$$\text{Amperes} = \frac{\text{horse-power carried} \times 746}{\text{volts between phases} \times \sqrt{3}}.$$

In the example given, with 50 h.p. carried and 350 volts between phases, this works out to 61·5 amperes, which a ·062 square inch conductor will safely carry at 1,000 amperes per square inch cross-section.

The question says nothing about the permissible voltage drop in the 500 yards of feeder cable. The loss per 100 yards of single conductor working at 1,000 amperes per square inch is $2\frac{1}{2}$ volts, and, therefore, the drop in the 500 yards of feeder between two-phase wires—*i.e.*, 1,000 yards of conductor—is 25 volts, which means 7 per cent. of 350 volts. The loss due to induction and dielectric hysteresis is negligible. If the drop ought not to exceed 5 per cent.—*i.e.*, $17\frac{1}{2}$ volts—the section would be $\cdot062 \times \frac{25}{17{\cdot}5} = \cdot088$ square inch. This gives the sizes of the three outer conductors, but there is yet the neutral to consider. It will be seen from the diagram that if the incandescent lamps are so arranged as to be equally balanced between the three outers and the neutral, no current would flow in the neutral conductor. This is not possible in practice, but in a small system like that we are considering it should be possible, by careful arrangement of circuits, to balance so far that the out-of-balance current flowing in the neutral would not be more than 25 per cent. of the line current at any time. In this case the neutral need only be one-quarter of the sectional area of the outer conductors—*i.e.*, the four-core feeder cable mentioned would have three conductors, ·062 square inch area ($^{19}/_{16}$ S.W.G.) and the neutral, say, ·017 square inch area ($^{7}/_{17}$ S.W.G.). In town lighting the neutral is generally made the same area as the other conductors.—DUPLICATOR.

LONDON TRAFFIC COMMISSION.

The Royal Commission on Locomotion in London sat last Friday, under the presidency of Sir D. Barbour, to hear further evidence by **Mr. E. Harper,** statistical officer of the London County Council.

Examined by the Chairman, the witness described the effect upon the Metropolis of the railway system. He first submitted a table giving the figures of the number of persons entering the central area daily by railway, tramway, and omnibus before half-past 10 o'clock in the morning, and stated that 300,000 came from the north of the river and nearly 200,000 from the south. The congestion in the streets was due to the setting down of large numbers of passengers at particular points, as the railways and tramways did not, as a rule—as the omnibuses did—run through to the far side of the central area. The extension underground of railways and tramways through the central area would relieve both pedestrian and vehicular traffic in the streets. In some cases certain railways conveyed passengers right across the central area.

The **Chairman:** The general tendency of your evidence is this—that to get the working classes to live out of congested districts there is no measure so effective as cheap fares?—Yes. Fares of all kinds have been tried for years past, but none of them have succeeded.

By Sir G. Bartley: There were certain classes connected with certain trades where it is almost impossible for them to live in the country, owing to their having to go backwards and forwards to their workshops.

Examination continued: There were a great number of trades in the neighbourhood of Regent-street and Soho where people were continually going backwards and forwards between the shops and their own dwellings during the day, but he thought that under the existing conditions it would be much better for those people to be working in workrooms open to Government inspection than working, as many there did at present, at home, and if that were so the factories could be removed further out. He thought that a number of radial lines going out considerable distances at cheap fares would greatly relieve the pressure, and he would add that the radial lines should run across the central area so as to distribute the passengers equally over the whole of the central area, instead of dumping them down at one particular spot and so causing congestion.

Mr. J. W. Benn was the next witness. Examined by the Chairman, he said he had been chairman for the past five years of the Highways Committee of the London County Council, which dealt with all matters relating to tramways and electric lighting in the county of London. Two important defects in connection with the unsystematic manner in which tramways had been authorised in London were: (1) in the first place, certain of the undertakings authorised as distinct systems could only be worked satisfactorily as one undertaking, and the result had been the amalgamation of various lines working under different Acts containing a diversity of clauses governing their control and management; (2) owing to this lack of uniformity in the obtaining of legislation, different periods of purchase had been fixed for the same system. The Council, since it was constituted in 1889, had almost uniformly adopted the policy of refusing consent to the tramway proposals of companies on the ground that, as the tramway authority under the Tramways Act, it should itself construct and own all new tramways in the county in order to secure continuity in the tramway system of London, and to ensure the works being carried out in a satisfactory manner as regarded extent of widenings, etc. There had been certain exceptional cases, however, in which the Council had consented to the construction of lines in extension of and supplementing existing systems. In those cases it had required that the date of purchase should coincide with that obtaining with regard to the tramways of which the new lines had formed a part. The witness said that there are about 115 miles of tramways in London, but to be properly served London should have 1,000 miles of street tramways.

The Commission adjourned.

PERSONAL.

We understand that Mr. R. A. Chattock, city electrical engineer, Bradford, has been appointed to a similar position in Birmingham, at a salary of £1,000 per annum.

Mr. H. Webber has been appointed chief assistant engineer at the Hastings Corporation electricity works.

APPOINTMENTS VACANT.

Two Skilled Cable Jointers, Durban Municipality, 15s. a day. Applications, by letter, to be sent to Z.X.Y.Z., care of Deacon's Advertising Offices, Leadenhall-street, London, E.C., by July 27. See advertisement.

Electric Lighting Superintendent, Electricity Works, 27, Osborn-street, Whitechapel, E., July 20. See advertisement.

Assistant Electrical Engineer, Corporation of Torquay, £156 per annum, July 20.

Clerk of Works, generating station, Bath, July, 13.

Assistant, with knowledge of details of overhead "trolley" system, Messrs. Pritchard, Green, and Co., 37, Waterloo-street, Birmingham.

Clerk of Works, London County Council Tramways, 3 to 3½ guineas per week, July 22.

STOCKTON-ON-TEES ELECTRICITY ACCOUNTS.

Herewith are given abstracts of the revenue account and general balance-sheet of the Stockton-on-Tees electricity department for the year ended March 31, 1903, together with the statement of electricity generated, sold, etc.

REVENUE ACCOUNT.

Dr. Expenditure.	£	s.	d.

LEGAL INTELLIGENCE.

ST. MARYLEBONE ELECTRICITY PURCHASE.

On the 2nd inst. Mr. Justice Buckley had before him the case of the Metropolitan Electric Supply Company, Limited, *v.* the Mayor, etc., of the Metropolitan Borough of St. Marylebone, an action by the plaintiffs to enforce specific performance of a contract for the sale of a portion of the plaintiff's undertaking to the defendants.

Mr. Cripps, K.C., Mr. Astbury, K.C., and Mr. Sarjant appeared for the plaintiffs; and Mr. Fletcher Moulton, K.C., Mr. Buckmaster, K.C., Mr. E. Clayton, and Mr. A. B. Cane for the defendants.

It appeared from the statement of **Mr. Cripps** that the plaintiff company obtained parliamentary powers for the supply of electricity in the districts of St. Marylebone, Paddington, St. Martin's-in-the-Fields, and the Strand districts. Under special statutory powers the company constructed a generating station at Willesden, from which they supplied electric energy to their areas of supply in London. In addition, they had various supply stations, and subsequently they supplied St. Marylebone partly from these supply stations and partly from energy from the Willesden works. In 1901 the defendants obtained parliamentary powers to supply electric energy within their district, on the basis of buying out the plaintiff company. Notice to treat was given on Nov. 1, 1901, and the amount payable as compensation by the defendants to the company was to be settled by arbitration. By the award of Mr. C. A. Russell, K.C., the umpire in the arbitration, the sum awarded to be paid by the defendants to the company for the sale of its undertaking was £1,212,000, Mr. Russell fixing the value as from Dec. 31, 1901, which was, by arrangement between the parties, to be treated as the date of the notice to treat. After this award had been issued, the defendants could not obtain the consent of the London County Council for a loan, and thus could not complete the purchase of the plaintiff company's undertaking at once. Since Dec. 31, 1901, the company had, it was said, incurred an annual capital expenditure of about £50,000 in performing their obligations to the consumers, and the main question in the present case was whether the company could recover this amount from the defendants under the contract. The plaintiffs accordingly asked for a decree of specific performance and an enquiry as to the amount of capital expenditure incurred by the company in meeting their obligations since Dec. 31, 1901.

The defendants' case was that the plaintiffs were bound by the findings of the arbitrator. They further said that the expenditure in question was incurred by the company in respect of their external undertakings at Willesden and elsewhere, and that they had therefore no benefit in it. It was stated that defendants were appealing from the decision of the County Council to the Local Government Board, as to raising a loan for the purpose of completing the purchase, and that the defendants were willing to take and pay for all mains, etc., laid down, which was suitable for the St. Marylebone supply.

In the result, **His Lordship** gave judgment for the plaintiffs for specific performance of the contract, and directed that there should be an enquiry as to the title to certain leasehold and freehold premises included in the contract. He referred it to Mr. C. A. Russell to take, for the purposes of completion, accounts of the capital and other expenditure, and all the receipts of the plaintiff company from Dec. 31, 1901, to the completion of the purchase, and left it to him to determine what part of such capital and other expenditure ought, for the purposes of the accounts, to be allowed as between the plaintiffs and the defendants. His Lordship referred it to Mr. Russell to say, in case the plaintiffs did not show a good title to any freehold or leasehold premises, what sum should be allowed the defendants for compensation. He fixed Dec. 31, 1903, as the date for completion, and directed that the sum of £100,000 should be paid into Court by the defendants, the balance of the purchase money to be paid to the plaintiff company. He gave liberty to apply to extend the time for completing, and reserved the costs. It was arranged that if the parties could not agree on Mr. Russell acting as directed by his Lordship, Mr. Pollock (the official referee) should conduct the enquiry.

FENCING OF ELECTRICAL MACHINERY.

In the Divisional Court, composed of the Lord Chief Justice and Justices Wills and Channell, on Wednesday the Mile End Guardians appealed from the decision of the magistrates of the Thames Police Court fining them 1s. and 10s. costs for not securely fencing a steam-engine at the electricity generating station attached to their workhouse and infirmary in Bancroft-road. The proceedings were instituted at the instance of the factory inspector after a man had been killed while attending to the engine.

On behalf of the appellants **Mr. Danckwerts, K.C.**, contended that as the premises were not used for the carrying on of any trade, and were not a public building in the strict sense of the term, the public having no right of access, the Factory Act did not apply.

Mr. Robertson, on the other hand, submitted that in the sense intended by the Act the workhouse and infirmary were public buildings.

The **Lord Chief Justice**, while admitting that the case raised a difficult question, thought the Act intended to include buildings of this kind used for *a quasi* public purpose.

The other judges concurred, and the appeal was dismissed, with costs.

South Staffordshire Tramways.—This Bill was before Lord Morley's Committee on Tuesday, and the preamble was declared proved. The Bill gives the company power to construct additional tramways, and for working tramways by electrical power.

COMPANIES' MEETINGS AND REPORTS.

BRITISH ELECTRIC TRACTION.

The ordinary general meeting of the shareholders in this Company was held at Hamilton House, Victoria-embankment, on Wednesday, Sir Charles Rivers Wilson presiding.

The **Chairman**, in moving the adoption of the report and accounts (which appeared in our last issue), said he was able again to congratulate the shareholders on the continued expansion of the business, but they had to pay interest and dividends on a much larger capital than last year, so that, although the profits were about £35,000 larger, they were not able to recommend the payment of the same rate of dividend on the ordinary shares as last year without unduly reducing the amount to be carried forward. The reduction of the dividend by 1 per cent. was mainly due to a larger amount of new capital having been expended during the year, which during the period covered by the accounts had not become productive of profit, but, nevertheless, ranked for interest or dividend. An important point for the shareholders to know was that the proportion of profits which came in the form of dividends and interest on the shares and debentures they held in associated companies showed a steady and considerable increase each succeeding year. Giving details of how the main item of £264,000 of gross profits was made up, he said he hoped he had made it clear that a portion of the profit was made in connection with the construction of new works and the establishment of new undertakings; but the important point for the shareholders to appreciate was that the profits which were of a recurring kind, which were not dependent upon the establishment of new undertakings, were increasing very satisfactorily, and now constituted by far the largest proportion of the total profits. Taking all matters into consideration, there should be no cause for surprise or disappointment in the slight reduction of dividends; but, on the contrary, it was a matter for congratulation that, in the circumstances, they were able to pay so high a dividend as 8 per cent. With regard to the proposal to issue second debenture stock, he pointed out that it was important they should raise a larger proportion of their capital at a lower rate of interest than was payable upon the share capital. They, therefore, suggested that the directors should be empowered to borrow up to an amount equal to the share capital, and this would enable the directors to issue second mortgage debenture stock. Further capital would be required from time to time for the conversion to electric traction of several tramways still worked by horses or steam, and for the construction of lines for which they had obtained powers. The issue of second debenture stock would not in any way whatever affect the rights of the holders of the first debenture stock. With regard to the investments, these showed a considerable increase. They were desirous that the reserve fund should be a real one, and £200,000 of it was invested in consols, the rest being employed in the business. The return on these investments was steadily increasing. The Birmingham papers had recently published a series of remarkable misstatements in regard to the Company's objects and methods. As a matter of fact, they had every reason to be satisfied with the progress they had made there. For many years they had worked steadily to consolidate the tramway systems of the Black Country and to convert them to electric traction, and, although the process had been a slow one, it had been eminently successful. Unfortunately, the desire for municipalisation prevailed in Birmingham; but the result of their work had been to get the people of Birmingham and the Corporation a vast amount of information, and he was glad to say that the Corporation of Birmingham was showing a disposition to deal with the matter seriously, and to give the Company, voluntarily, the necessary facilities for through communication and for electrification of the lines, which, until lately, they refused to grant. After referring to the acquisition, in North London, of the Metropolitan Electric Tramways, and to the Auckland Electric Company, the chairman proceeded to refer to their investments in the Brush Electrical Engineering Company and the Electrical Distribution Company, and passed on to refer to some details in the accounts.

Mr. E. Garcke seconded the resolution, which was carried unanimously.

An extraordinary general meeting was afterwards held, at which resolutions were passed, making certain alterations in the articles of association to enable the directors to issue second debentures.

The proceedings closed with the usual vote of thanks.

NEW GENERAL TRACTION.

The annual general meeting was held on Friday at Salisbury House, Baron E. B. d'Erlanger presiding. In moving the adoption of the report, which appeared in our last issue, the **Chairman** said that, considering the bad times through which the Company had passed, and from which it might be said to be only just emerging, he thought that the shareholders would agree with the Board that it would not be prudent to distribute that amount, and that it would be better to carry it forward. The Company had been gradually converted by force of circumstances from a construction company into a trust company. He then proceeded to deal in detail with the various undertakings in which the Company were interested. Their Bill for a railway from Coventry to Arley, which would have placed the former town in direct communication with the Midland Railway, and which received a large amount of local support, was unfortunately thrown out. Terms had been arranged with the Corporation of Coventry granting the Coventry Electric Tramways Company very valuable extensions. The receipts of the Norwich Electric Tramways Company had shown a steady improvement since the autumn. There seemed to be a feeling

Digitized by Google

in the town that the tramways there should have been a municipal concern. The Company had a large stake in the Philadelphia, Morton, and Swarthmore Street Railways Company, the completion of which was delayed by legal proceedings. Last year the Company's critics alleged that their capital was too large, but he quoted statistics to disprove this. A sum of £240,000 would be needed for the new extensions and other matters, but the Board hoped that before the money was actually required they would be able to sell in the United States a sufficient number of the bonds of the Philadelphia enterprise to meet the necessity.

The **Hon. A. G. Brand, M.P.**, seconded the motion, which was adopted.

BRITISH ALUMINIUM.

Presiding over the ordinary general meeting of the shareholders at Winchester House on Tuesday, **Mr. J. D. Benner**, in moving the adoption of the report (*vide* last issue), said that it indicated that even at the close of 1902 considerable progress had been made in overcoming the difficulties which beset the Company a year ago. Although the year's trading had had to bear an abnormal expenditure of about £2,000, the profits were about 60 per cent. greater than those of the preceding 12 months. The demand for aluminium continued satisfactory throughout the world. The Company's sales during the year had been very materially in excess of those for the corresponding period of the previous year, and the increase had been well distributed over all sections of the business. There had consequently been a material reduction in the amount of stock. The Board thought that, as a matter of policy, they should always have a considerable reserve of stock. They have therefore decided to increase the production at Foyers as soon as the necessary furnaces could be erected. A material increase in the Company's productive power before the end of the current year was assured. The aluminium and carbon works would have to be extended. The revision of the basic terms of the understanding between the Company and other aluminium producers was arranged at a conference early in the present year. The Board did not consider that they succeeded in obtaining all they were entitled to, but they recognised that there was an evident desire to meet their wishes. They therefore decided to content themselves for the present with the concessions which they accepted. The new arrangement took effect from Jan. 1 last, and the profits for the current year would be favourably affected by it. A considerable reduction in the cost of the manufacture of carbide had been effected, and the Board had resolved to continue its production. Consequently the whole of the present valuable water power would be utilised, and as it was possible that later on further power might be required for the production of aluminium, the Board decided to proceed with the erection of two more dynamos. This step, with the accompanying necessary works, would involve an outlay of nearly £15,000, but the expenditure would be extended over a period of not less than 18 months, which would be required for the completion of the work. All the extensions which he had mentioned would involve an outlay of nearly £240,000, but the Board hoped that the improved position of the business would enable them to provide this sum from the internal resources of the Company.

Mr. H. Wolfenden seconded the motion, which was adopted.

UNITED RIVER PLATE TELEPHONE.

The annual general meeting was held on the 2nd inst. at Winchester House, Mr. J. Irving Courtenay presiding.

The **Chairman**, in submitting the usual motion to the shareholders, reminded them that the report dealt with a period for the most part anterior to the great improvement resulting from the bountiful harvest with which the River Plate had been favoured. The Company had progressed throughout, and the increased prosperity of Argentina must undoubtedly still further improve the prospects of the Company. Unusual expenditure for maintenance and renewals was occasioned in the early part of the year by the removal of their chief central exchange from the location it had occupied for more than 20 years in Calle San Martin to their building in the Avenida de Mayo, and during the latter months by storms of extraordinary severity in the province of Buenos Ayres, which seriously damaged some of their most important lines in many directions. The Company's underground plant, established and being extended in Buenos Ayres and commenced elsewhere, would remedy to a considerable extent the risks from these severe storms, but their pole lines must always be subject to possible injury from this source. The present position of the Company was better and stronger than it had ever been. They now covered to a great extent the city and province of Buenos Ayres, the richest and most populous district in South America, and they also occupied the two most populous cities in Argentina outside this district—Rosario and Cordoba. They might, therefore, confidently look forward to a reliable future for the Company's business and to its increasing importance.

The report was adopted.

ELECTRIC AND GENERAL INVESTMENT.

The ordinary general meeting of the shareholders was held at Winchester House on Wednesday, the 8th inst., Mr. George Herring presiding.

In moving the adoption of the report (which appeared in our last issue), the **Chairman** said the gross profit on the year's transactions of £19,424 was a falling off compared with the figures of the previous year, but the profit varied more or less with the condition of business, and last year was not a very favourable period. He afterwards went through the accounts, and explained the item of loan account, £309,211. With reference to the item of investments at cost, £299,758, he stated that he thought it right on the present occasion to say that they showed a small loss, as on previous occasions he had pointed out that their value was in excess of their cost. He wished again to state that the Company must be considered more or less of a speculative nature as regarded the rate of dividend paid. The shareholders had received dividends of 35 per cent., 45 per cent., and on one occasion 55 per cent., and it must be distinctly understood that the dividends might vary.

Mr. J. B. Braithwaite, jun., seconded the motion, which was unanimously adopted.

URBAN ELECTRIC SUPPLY.

The ordinary general meeting of the shareholders was held on Friday at the offices, Broad Sanctuary-chambers, Westminster.

In their annual report the directors state that the stations at Stamford, Hawick, Twickenham, Weybridge, Godalming, Dartmouth, and Camborne and Redruth, and the tramway between the two latter places were completed and opened during the year. Although these stations were running for an average period of less than six months, the profit derived therefrom amounted to £2,264. After adding interest on loans and deposits and deducting London expenses, including directors' fees and interest on calls paid in advance, there remains a balance of profit of £1,371. Dividends guaranteed by Edmundsons' Electricity Corporation, Limited, under their agreement amounted to £6,697, and after deducting the above profit, the balance of £5,326 has been duly provided by them.

Mr. Francis E. Gripper, who presided, said that during the year seven of the Company's undertakings were opened and commenced work, and the accounts in connection with them had to be audited, not only by their own auditor, but by the official auditor of the Board of Trade. The issued capital of the Company had now all been called up. Practically the whole of the capital that had been provided had been expended. It would be readily understood that the profitable development of such business required further capital from time to time. The Board had arranged with Edmundson's Electricity Corporation to advance any sums which might be required during the year, so that it would not be necessry to make any further capital issue at present. The form which the new capital would take was a matter which he thought the shareholders might safely leave in the Board's hands, as it would depend on the conditions existing at the time of issue. An official quotation on the Stock Exchange had been granted for both the ordinary and the preference shares. Valuable extensions to the Company's Twickenham undertaking had been obtained by agreement with the local authorities of the adjoining districts of Teddington and Hampton. He concluded by moving the adoption of the report.

Mr. W. Page seconded the motion, which was adopted.

CHILI TELEPHONE.

The report of the directors for the year ended March 31 last states that the aggregate number of subscribers at all centres at the end of the year was 5,371 as compared with 4,981 at the beginning, or a gain of 390 for the year. The gross revenue in Chili from all sources was 841,193dol. as compared with 759,139dol. the previous year, an increase of 82,054dol. The expenditure in Chili was 401,519dol. as compared with 365,776dol., an increase of 35,743dol. The net income in Chili from all sources was 439,674dol., as compared with 393,362dol. in 1901-2, an increase of 46,312dol. The average rate of exchange for the year was 15·68d., as compared with 14·85d. in the previous year, giving an increase for the year of 0·83d. Converted into sterling at these rates, the figures given are: in 1902-3, £28,723; in 1901-2, £24,340—an increase of £4,383. The liquid assets and liabilities in Chili on March 31, 1903, were valued at 16¾d., the current rate of exchange on that day, as compared with 13¾d. at which they were valued on the corresponding date of the previous year. The increase in the value of the liquid assets over liabilities in Chili due to this rise in exchange amounts to £1,455, which has been carried to reserve. The balance to the credit of the revenue account, including £2,733 brought from the previous year, is £26,100, of which £11,088 has been carried to reserve for renewal of plant, etc. The directors recommend the payment of a dividend of 6s. per share, less income tax, being at the rate of 6 per cent. per annum, absorbing £12,375, and leaving a balance of £2,637 to be carried forward. The total mileage was on March 31, 1903, 9,205 miles 892 yards; on March 31, 1902, 8,754 miles 527 yards—an increase of 451 miles 365 yards.

NEW COMPANIES REGISTERED.

Robert Atkinson (London), Limited (77,852).—Capital, £12,000. Object: to acquire that part of the business of the Viâ Eastern Code Company, Limited, which is known as the British Engineering Standards Coded Lists. Registered office: 729-730, Salisbury House, London-wall, E.C.

Uddington District Electric Lighting Company, Limited (77,856).—Capital, £1,000. Object: to carry on in Bothwell, co. Lanark, the business of electricians, mechanical engineers, and suppliers of electric light in all its branches. Registered office: 83, Cannon-street, E.C.

Havana Electricity Company, Limited (77,897).—Capital, £300,000. Object: to adopt an agreement with Señor Don Tiburcio Castaneda and La Compania de Electricidad de Cuba; to construct, equip, develop, and control railways, tramways, electric light, tele-

Digitized by Google

phone and telegraph works, and other public or private works and conveniences in Cuba or elsewhere.

Nicole Record Company, Limited (77,923).—Capital, £10,000. Object: to acquire the business now carried on at 147-150, Great Saffron-hill, E.C., as Nicole Frères, Limited (New Record Account); to adopt an agreement with Nicole Frères and G. H. Burt, and to carry on the business of manufacturers of and dealers in talking and sound-producing machines, electrical machinery and apparatus, telephones, apparatus for wireless telegraphy, telephony, etc. Registered office: 147 to 150, Great Saffron-hill, E.C.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Beszterczebanya, Neusohl (Austria).—The Municipality require tenders for the construction of an electricity station and plant of about 600 h.p. Tenders by Aug. 1.

Hammersmith.—The Borough Council invite tenders for the supply of 40 alternating-current series arc lamps and accessories. Tenders by July 15. See advertisement in last issue.

West Ham.—The Borough Council invite tenders for the supply of high-tension paper-insulated cable for tramway feeders and of multicore telephone and pilot cables. Tenders by July 14.

Barnstaple.—The Corporation invite tenders for wiring, lamps, fittings, switches, etc. Particulars may be obtained from Mr. James Bosson, town clerk, Barnstaple. Tenders by July 16.

Stepney.—The Electrical Committee of the Borough Council invite tenders for the supply of feed, suction, and other pipework, water-softening plant, and storage tanks. Tenders by July 21.

St. Asaph (Flints).—The Guardians invite tenders for lighting the workhouse and the new infirmary by electricity. Particulars may be obtained from the Master of the Workhouse. Tenders by July 16.

Sheffield.—The Electric Light Committee invite tenders for various electricity meters. Particulars may be obtained from Mr. S. E. Fedden, general manager and engineer. Tenders by July 21. See advertisement.

Pietermaritzburg.—The Corporation invite tenders for the supply of electric tramcars. Particulars may be obtained from Messrs. Mordey and Dawbarn, 82, Victoria-street, London, S.W. Tenders by July 29.

Ipswich.—The Corporation invite tenders for the supply and delivery of electricity meters. Particulars may be obtained at the office of Mr. Will Bantoft, town clerk, Town Hall, Ipswich. Tenders by 14th inst.

Pointe-a-Pitre (Guadeloupe).—The Municipality invite offers for a concession for public and private electric lighting for 15 years. Tenders by Aug. 29. Particulars may be obtained from the Colonial Office, Paris.

Manchester.—The Electricity Committee invite tenders for india-rubber matting. Particulars may be obtained on application to Mr. F. E. Hughes, secretary, Electricity Department, Town Hall, Manchester. Tenders by July 17.

Barnstaple.—The Corporation invite tenders for wiring, lamps, fittings, switches, etc. Particulars may be obtained from Mr. W. H. Trentham, 39, Victoria-street, Westminster. Tenders by July 16. See advertisement in last issue.

Lisbon.—The Public Works Department require tenders for the construction of 1m. gauge light railways as follows: (1) Limatal, Vianna-Ponte de Barca; (2) Oberer Minho, Braga-Monçao; (3) Braga-Guimaraes. Tenders by Aug. 1.

Blackburn.—The Town Council invite tenders for one complete main switchboard and accessories. Particulars may be obtained from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster. Tenders by July 27. See advertisement.

Reigate.—The Town Council invite tenders for electric lighting station extensions. Particulars may be obtained at the office of Mr. Fred. T. Clayton, C.E., borough engineer and surveyor, Municipal Buildings, Reigate. Tenders by July 15.

Christiania.—The Norwegian State Railways invite tenders for telegraph and telephone materials. Conditions of tender may be obtained on application to "Telegrafinspektörens Kontor," No. 8, Stenersgade, Christiania. Tenders by July 15.

Newport (Mon.)—The School Board invite tenders for the installation of electric light at St. Woolos School. Particulars may be obtained at the offices of Messrs. Lansdowne and Griggs, architects, Metropolitan Bank-chambers, Newport. Tenders by July 16.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

St. Pancras.—The Borough Council invite tenders for the supply of about 350,000 carbons of various lengths and diameters for 12 months. Specifications, etc., can be obtained at the Electricity Department Offices, No. 57, Pratt-street, N.W. Tenders by July 14 at noon.

London, N.W.—The St. Pancras Borough Council invite tenders for supplying about 31 miles of lead-covered and armoured cable. Particulars may be obtained upon application to the Chief Clerk, Electricity Department Offices, 57, Pratt-street, N.W. Tenders by July 14.

Manchester.—The Paving, Sewering, and Highways Committee invite tenders for laying underground telephone pipes, with other appurtenant works. Particulars may be obtained on application at the City Surveyor's Office, Town Hall, Manchester. Tenders by July 20.

Vienna.—The Minister of Commerce requires tenders for the construction of a lift for the Danube-Oder Canal, capable of allowing vessels to negotiate a difference of 35·90 metres. Premiums of 100,000, 75,000, and 50,000 kroner will be given to the three best schemes.

Swindon.—The Corporation invite tenders for seven electric tramcars, with all trucks, motors, and accessories. Particulars may be obtained from Messrs. Lacey and Sillar, 78, King-street, Manchester, and 2, Queen Anne's-gate, Westminster. Tenders by July 23. See advertisement.

Bath.—The Corporation invite tenders for the supply and erection of a jet condensing plant, etc. Particulars may be obtained from the consulting engineers, Messrs. Kincaid, Waller, Manville, and Dawson, 29, Great George-street, Westminster. Tenders by July 17. See advertisement.

Derby.—The Electric Lighting Committee invite tenders for the supply of accumulators, balancers and reversible boosters, and switchboards. Particulars may be obtained from Mr. T. P. Wilmshurst, borough electrical engineer, Full-street, Derby. Tenders by July 13. See advertisement in last issue.

London, N.W.—The St. Pancras Borough Council invite tenders for supplying an electric jenny and grab to their King's-road powerhouse, Camden Town, N.W. Particulars may be obtained upon application to the Chief Clerk, Electricity Department Offices, 57, Pratt-street, N.W. Tenders by July 14.

Preston.—The Corporation invite tenders for the supply and erection of economisers, feed-water heaters, electrically and steam driven pumps, and overhead travelling crane. Particulars may be obtained from Mr. Walter H. Tittensor, consulting and resident electrical engineer, 25, Burrow-road, Preston. Tenders by July 22.

Launceston (Tasmania).—The Mayor and Aldermen invite tenders for the supply of 500 or more electric meters. Particulars may be obtained on application to Mr. William Corin, city electrical engineer, Launceston, Tasmania, or to Messrs. John Terry and Co., 7, Great Winchester-street, London, E.C. Tenders by Sept. 28.

Heston and Isleworth.—The Urban District Council invite tenders for the supply of steam-engines, dynamos, boosters, etc., storage batteries, cables, and arc lamps and glow lamps. Particulars may be obtained from the Council's engineers, Messrs. J. and J. S. Enright, 47, Victoria-street, S.W. Tenders by 23rd inst. See advertisement in last issue.

Cheadle (Cheshire).—The Urban District Council invite tenders for the supply and delivery of about 350 tons of grooved steel girder tramway rails, eight tons of tie-bars, 13½ tons of fishplates, and three tons of bolts and nuts; also for 17 sets of points and crossings. Particulars may be obtained from Mr. Charles R. Brady, A.M.I.C.E., 13, Warren-street, Stockport. Tenders by June 27.

Weymouth and Melcombe Regis.—The Corporation invite tenders for the supply, delivery, and erection of the following in connection with the electric lighting of the town: Lancashire boilers, engines and dynamos, overhead travelling crane, switchboard and battery boosters, storage battery, arc lamps and arc lamp posts, pipework, feed pumps, economiser, ejector condensers, etc., distributing mains and feeders, by July 19.

RESULTS OF TENDERS.

Felixstowe.—The Urban District Council have accepted the tender of Johnson and Phillips, for cables, at £945.

Rochdale.—The Tramways Committee have accepted the tender of W. A. Peters and Son, Crossfield, Rochdale, for the erection of a car-shed.

Colchester.—The Tramways Committee recommend the acceptance of Messrs. J. G. White's tenders for the construction of the Colchester tramways at £35,035.

Crewe.—The Town Council have resolved to accept the tender of the British Thomson-Houston Company to supply lamps of 5, 8, 16, and 25 c.p., 130-250 volts, at 9½d.

Marylebone.—The Council have accepted the tender of Messrs. A. W. Penrose and Co., 109, Farringdon-road, for electric light installation at the town hall, at £73. 9s. 6d.

Bradford.—The Guardians have accepted the tender of Messrs. Smith and Croft, Bradford, at £1,020. 3s., for a complete electric light installation at their sanatorium for consumptives at Eastby, near Skipton.

Middlesbrough.—The Electric Lighting Committee have accepted the tender of Messrs. Callender, London, for the carrying out of the electric lighting extension scheme to Grove Hill and Linthorpe, at £2,733.

Ilford.—The Urban District Council have accepted the tender of W. Newbold and Co., Pearl-buildings, London Bridge, S.E., at £384. 5s., for supply of machinery and tools in connection with their electric tramways.

Colchester.—The Electric Light Committee recommend the Council to accept the tender of the Henley Telegraph Works Company, Limited, to supply the required lengths of cable for North-hill, North Station-road, and Bergholt-road extension, at £1,635; and for raising main switchboard, etc., at £56.

Spennymoor.—The Urban District Council have accepted the tender of the Electricity Company at £2. 10s. per lamp for the

Digitized by Google

district now lighted by Spennymoor Gas Company, £2. 11s. 6d. per lamp for the Blocks, and £2. 9s. 6d. per lamp for the Tunnel and Merrington-lane footpath.

Engine Contracts.—Messrs. J. Howden and Co. have recently booked the following orders: One 100-kw. engine and generator for the Scottish Co-operative Wholesale Society, Limited (Leith branch); one 300-h.p. compound engine, for Messrs. A. M. Bruce Peebles and Sons, Limited, Rishton Paper Mills; one 300 h.p. compound engine, for Messrs. Mather and Platt, Limited, Manchester.

Battersea.—The Lighting Committee recommend the following tenders for acceptance: Messrs. H. and G. Messures for carrying out necessary works of repair, etc., to the blow-down tank at the central electric generating station, £37. 10s.; W. T. Glovers, Limited, for supp'ying cable, etc., required for the purpose of connecting the new dynamo with the switchboard at the central station, £38. 1s. 7d.; Callender's Cable and Construction Company for supplying materials as may be required in connection with the extension of electric mains, the estimated cost of such articles and materials amounting to £1,148.

Rochdale.—The following tenders have been accepted in connection with the tramways: J. G. White and Co., Limited, London, for overhead line equipment of the remainder of the tramway system, at £21,619. 13s. 10d.; Lorain Steel Company, for points and crossings and for the entrance to the car-shed, including rails and fishplates, at £2,587; Hadfield's Steelfoundry Company, Limited, Sheffield, for the supply of points and crossings for the general track, at £5,322; W. Scott, Limited, Leeds Steelworks, Leeds, tramrails and fishplates: Bayliss, Jones, and Bayliss, Victoria Works, Monmore-green, Wolverhampton, tiebars, bolts, and nuts; L. Cooper, jun., Leeds, soleplates.

Paisley.—The following tenders are recommended for acceptance for the work to be carried out at the electricity works:

J. Porter and Sons, Jeanfield Brickworks, London-road, Glasgow, bricklayers and masons	£2,267	13	6
D. Clerk and Son, Limited, 92, Wellington-street, Glasgow, steelwork	358	13	1
G. and T. Houston, 5, Maxwellton-street, carpenters, ironmongers, etc.	521	13	9
A. Shaw and Sons, 51, High-street, slaters	135	5	0
A. Forsyth and Son, 46, Broomlands-street, plumbers	154	1	2
D. T. Hutchison and Son, 25, Gauze-street, plasterers, concretors, etc.	99	3	9
Cherry and Co., Limited, 100, Bath-street, Glasgow, tilework	94	0	6

Maidenhead.—The following tenders have been received for extensions to the central station buildings:

Peerless, Dennis, and Co., Eastbourne	£1,242	0	0
Thompsett and Co., Farnham	1,221	0	0
W. J. Bloxham, Banbury	1,174	0	0
H. Flint, High Wycombe	1,127	12	6
C. W. Cox and Sons, Maidenhead	1,110	0	0
A. J. Colborne, Swindon	1,099	19	6
F. W. Edwards, Maidenhead	1,080	0	0
F. Bissley, Maidenhead	1,020	0	0
W. E. Theaker, Maidenhead (accepted)	874	0	0

The following tenders have been accepted: Messrs Aiton and Co., extension of steam, exhaust, feed and other pipes, feed-pump, etc., £490. 5s.; Messrs. Johnson and Phillips, extensions to switchboard, connections to new dynamo, etc., £236.

London County Council Tramways.—The following tenders have been received for the erection of the second portion of the Clapham car-shed:

Kirk and Randall, Woolwich (recommended for acceptance)	£29,434	0	0
H. Lovatt, London and Wolverhampton	29,844	0	0
W. Pattinson and Sons, Westminster	29,852	0	0
C. Wall, Chelsea	30,047	0	0
W. Jones and Sons, Bow	30,240	5	2
F. Morton and Co., London	30,355	0	0
Holloway Bros., Limited, Lambeth	30,875	0	0
F. and H. J. Higgs, Loughborough Junction	31,000	0	0
Grays Steel Construction Company, London and Grays	31,202	0	0
B. E. Nightingale, Lambeth	31,552	0	0
Perry and Co., Bow	31,700	0	0
H. L. Holloway, Deptford	31,900	0	0
M. T. Shaw and Co., London	32,277	0	0
W. Norton, Chelsea	32,878	0	0
J. Westwood and Co., Millwall	33,071	6	1
F. G. Minter, Westminster	33,612	0	0
J. Jackson, London	34,541	10	0
Peirson and Co, London	39,941	0	0
C. B. Roberts and Co., Redhill	36,528	0	0

BUSINESS NOTES.

TRACTION.

Prestwich.—Bury Old-road is to be widened for tramway purposes.

Clydebank.—A demand is being made for special car facilities for working men.

Reading.—The formal opening of the electric tramway system has been fixed for the 22nd inst.

Bexley.—The District Council are taking up £20,000 of the loan of £30,000 for tramway purposes.

Branksome.—The local authority have withdrawn their opposition to the Bournemouth Tramways Bill.

Ashton.—The electric cars will probably be running through from Manchester in about a month's time.

Blackburn.—The Town Council have again rejected a proposal for the extension of the tramways to Revidge.

Central Wilts.—A meeting in support of the proposed Central Wilts light railway was held at Calne on Friday.

Lizard Light Railway.—It is proposed that work shall be started on the construction of this railway in the autumn.

Brampton.—The Parish Council are considering a scheme of electric tramways which has been submitted to them for approval.

Tipton.—A start is to be made with the work of equipping the tramway from Dudley to Wednesbury through this district for electric traction.

Airdrie.—With the intervention of the Board of Trade an agreement is being come to between the Corporation and the tramways company.

St. Marylebone.—The Borough Council are recommended to oppose the construction of the proposed tramway along Tottenham Court-road and Edgware-road.

Sheffield.—A proposal to defer the question of accepting advertisements for the tramcars for 12 months was defeated at this week's meeting of the Council.

Birkenhead.—The Tramways Committee have transferred £3,595, the amount of income over expenditure on revenue account for the past year, to a renewal fund.

Fraserburgh.—The new light railway, which connects the villages of St. Combs, Inverallochy, and Cairnbulg, with Fraserburgh, has been opened for passenger traffic.

Paisley.—It is announced that contracts have been placed in connection with Mr. Murphy's tramway scheme, and the work of construction will be commenced forthwith.

Crewe.—Terms of agreement are being arranged between the Town Council and the company which proposes to lay down a system of light railways for the town and district.

Brighton.—Lord Hatherton's Committee of the House of Lords has passed the preamble of the Bill promoted by the Corporation to extend the tramways in various directions.

Camberwell.—The Borough Council have agreed to contribute one-third of the cost of the necessary street widenings in connection with the County Council's tramway scheme.

Great Orme's Head Tramway.—The upper section of the Great Orme's Head tramway was opened for traffic on Wednesday after satisfying the requirements of the Board of Trade.

Newcastle.—The Tramways Committee have decided to request Mr. Rossignol to prepare an estimate of the cost of laying an extra line of rails from the centre of the city to Gosforth.

Hanwell.—Land at Hanwell has been sold at the rate of £15,000 an acre, which before the advent of the "tube" and the electric tramways was disposed of at about £1,000 per acre.

Ilkeston.—Mr. Pilcher, engineer and manager, has been instructed to draw up the necessary plans and specifications for substituting double track in place of the existing single-track tramways.

Wallasey.—It was stated at the monthly meeting of the District Council that there is a prospect of an early extension of the tramways to Wallasey village, nearly all the surveys having been completed.

Aberdeen Suburban Tramways.—A meeting of the Aberdeen Suburban Tramways Company has resolved that the directors be now authorised to issue the total share capital of the company, £72,000.

Ipswich.—A memorial from tradesmen of Tavern-street has been sent to the Town Council protesting against "the long-continued stoppage of traffic owing to the reconstruction of the tramways."

Stepney.—The Borough Council have decided not to consent to the London County Council's proposal to adopt overhead traction on the projected electric tramways on the Mile End, Burdett, and other roads in East London.

Bromley (Kent).—The Urban District Council have decided to organise "effective opposition" to the application by the British Electric Traction Company for tramway powers in this and neighbouring districts, referred to in our last issue.

Bournemouth.—The Town Council have decided by 29 votes to 6 not to run tramcars on Sundays. The Corporation will shortly take over the Poole and Branksome tramway, and, according to agreement, will have to run Sunday trams in those districts.

Derby.—The Tramways Committee have arranged to pay to the Electric Lighting Committee £150 per annum for the next three years in consideration of the services rendered by Mr. Wilmshurst, the electrical engineer, in connection with the electric tramway scheme.

St. Pancras.—A letter from the London County Council has been referred to the Electricity Committee of the Borough Council asking if the Council are prepared to give their statutory consent to the construction of the suggested tramway along Tottenham Court-road.

Cathays.—In view of the continued agitation in Cathays for the lowering of Salisbury-road Bridge, which would enable the ordinary double-decked tramcars to be run, the members for the ward have arranged for a *plébiscite* of the inhabitants to be taken on the question.

Lewisham.—The Borough Council are approaching the London County Council on the subject of their proposal to construct electric tramways through the borough, asking for information which, when obtained, will doubtless be very valuable and assist towards the solving of the problem.

Digitized by Google

Irvine.—At the monthly meeting of the Irvine Town Council this week it was unanimously agreed to open negotiations with the County Council of Ayrshire and the town councils of the neighbouring burghs with a view to obtaining their opinions on the formation of a joint electric traction scheme for the district.

Rochdale.—The tramway company's lines will be taken over by the Corporation on the 31st inst., and it is intended to begin the reconstruction of the tramways for electric traction forthwith, so as to have the electric cars running in the centre of the town and on the best paying sections as soon as possible.

Bury.—The section from Blackford Bridge to the boundary of Unsworth and Whitefield is to be laid with a double track in place of the single line originally contemplated. The tramways in Radcliffe, when constructed, are to be taken over by the Corporation under an agreement with the Urban District Council.

Ilford.—The District Council, by way of experiment, have decided to equip one of the electric cars with a covered top, after the fashion adopted at Liverpool, Leeds, etc. The electric cars are now running on the section from the Broadway to Rodingbridge, within a few yards yards of the East Ham electric car terminus.

Wednesbury.—The difficulties between the Corporation and the South Staffordshire Tramways (Lessee) Company, Limited, are now settled, and the Town Council at their next meeting will be recommended to sanction the sealing of the necessary agreement for an improved system of traction in the borough.

Lowestoft.—The question of running the electric trams on Sundays, which evoked considerable opposition on the part of the members of the religious bodies in the town, has been decided by the Corporation. The cars will not commence to run until noon, a compromise which, it is hoped, will meet the wishes of the townspeople.

Chester.—A movement is on foot with a view to securing the extension of the electric tramways from City-road to Great Boughton. Numerous residents are discussing the advisability of selecting two candidates for the November contest, irrespective of party, who, if returned to the Council, would use very effort to obtain the extension.

Southend.—On Friday, whilst an electric car was proceeding down London-road at Southend-on-Sea, the trolley boom broke and fell on to the top of the car. A lady passenger was cut about the face and head, and was removed to the nearest surgery. Other passengers had narrow escapes, whilst a number of seats were smashed. Traffic was interfered with for a considerable time.

Baker-street and Waterloo Railway.—Lord Morley's Committee had before them on Tuesday the transfer Bill which transfers the above undertaking to the Underground Electric Railways Company, Limited. There was no opposition, and the preamble of the Bill was declared proved. In the Commons the Baker-street and Waterloo Railway (Extension of Time) Bill has been read a third time.

Leeds.—The Board of Trade is examining the details of the working of the Leeds tramway system with a view to authorising an acceleration of speed. At the request of the Board of Trade the Leeds authorities have prepared particulars as to gradients, speeds, etc., on the routes over which they run cars, and it is hoped that as a result a revision of the maximum speed allowed may be made.

West London.—As an example of the popularity of the London United Electric Tramways system, it is interesting to know that during the past week considerably over a million passengers have been carried, the receipts being £7,654, thus comparing very favourably with other metropolitan lines, such as the Central London, the receipts for the same period being £6,788, and the Metropolitan District Railway £7,079.

Maidstone.—The Board of Trade have determined to confirm the order of the Light Railway Commissioners as to Railway No. 1 (from High-street to the borough boundary), but not as to Railway No. 2 (from the borough boundary to the Bull Inn, Barming. It is stated that this decision is quite agreeable to the Corporation, who have no ulterior motive in view, such as extending the borough boundaries, so as to include Barming.

Bradford.—Major Pringle, Board of Trade inspector, on Friday, travelled over and inspected the Drighlington and Buttershaw extensions of the Bradford city tramways. He was accompanied by the general manager (Mr. C. J. Spencer), the city surveyor (Mr. J. H. Cox), the tramways engineer (Mr. Taylor), the traffic superintendent (Mr. Schofield), and the rolling-stock superintendent (Mr. Edwards). Major Pringle was understood to be fully satisfied with the lines.

Leith.—Mr. James More has presented his report to the Town Council as to the value of the tramways undertaking in the burgh, and the conversion of the present lines to electric traction on the overhead system. He estimates the undertaking as worth £78,512, and the cost of reconstruction at £77,000, giving a total capital expenditure of £157,000. The new system worked by the Corporation, and with the terminus at Pilrig as at present, would, he considers, result in a net annual profit of £3,444.

Darlaston.—The Urban District Council have decided to offer no objection to the proposed transfer of the undertakings authorised by the Dudley, Sedgley, and Wolverhampton Tramways Order, 1880 and 1884, the Dudley and Wolverhampton Tramways Order, 1899, the South Staffordshire Light Railways Order, 1900, and the South Staffordshire Light Railways (Extensions) Order, 1900, from the British Electric Traction Company, Limited, to the Wolverhampton and District Electric Tramways, Limited.

Turton.—The delay of the Board of Trade in giving their decision on the application of the Lancashire Light Railway Company for powers to construct light railways in the district, under the Bolton, Turton, and Darwen order, was discussed at the last District Council meeting, and the chairman and clerk were authorised to interview the Board of Trade and urge that the order should be confirmed or rejected forthwith, as the withholding of the decision was preventing other schemes from being submitted.

Halesowen.—The Light Railways Committee have resolved to empower a representative to settle for the transfer of the electric lighting order and light railways orders upon the following terms—viz.: (1) the costs of and in connection with the orders to be paid back as quickly as possible after the execution of the agreement; (2) the Lye to Halesowen line to be put down at an early date; (3) the Halesowen to Old Hill length to be carried out at an early date; (4) the Halesowen to Birmingham line to be put down as early as possible.

Bromsgrove Light Railway.—The promoters of this light railway scheme are applying to the Board of Trade for an extension of time for the completion of the works sanctioned under a parliamentary order some years ago. The delay that has occurred in the carrying out of the scheme is attributed to the obtaining of a lighting order, and to the failure of negotiations for amalgamating the scheme with the proposed Redditch undertaking. The project has now, however, been revived in another form, and the promoters are hopeful that the work will be proceeded with shortly.

Hammersmith.—At the last meeting of the Borough Council the Law and Parliamentary Committee recommended that the London County Council be informed that, subject to details being arranged, the Borough Council will be prepared to consent to the construction of the proposed tramway from Shepherd's Bush to the Marble Arch, and to make a contribution of one-third of the cost of the necessary street widenings, not exceeding £9,260, provided that the tramway is continued either along Uxbridge-road to Bayswater or along Latimer-road. The recommendation was carried.

Stroud.—The following resolution has been passed by the Urban District Council: "That the Council consider that the Stroud District and Cheltenham Tramways Bill will if passed be of great benefit to the district, and they therefore strongly approve of the Bill, and hereby resolve to give it their hearty support. The Council respectfully urge the Great Western Railway Company to withdraw their opposition, and the Council appoint their vice-chairman, Mr. C. P. Allen, M.P., and Mr. J. H. Tratt to attend, if necessary, before the committee and give evidence in support of the Bill on behalf of the Council."

Walsall.—The permanent way for the tramway extensions in Walsall and district is rapidly approaching completion, and the erection of the overhead electrical equipment is being pushed forward. It is proposed to have the whole of the new lines in readiness for the cars to commence running on Jan. 1, the date upon which the Corporation take over the lines in the borough. At a meeting of the Town Council on Monday the Tramways Committee will present a special report with respect to the arrangements to be made for working the Corporation tramways, as amended and approved by the General Purposes Committee.

Additional Traffic Returns.—Anglo-Argentine, £1,610 increase; Barcelona Ensanche y Gracia, £205 increase; Barcelona, £8 decrease; Brisbane, £43 decrease (month of June, £9,575, decrease £612); British Columbia Electric (month of March), gross earnings £10,352, net income £2,658; Buenos Ayres and Belgrano Electric, £298 increase (month of April, £12,995, increase £1,125); Calcutta, £423 increase; Cape Town (month of April), receipts £16,003, expenditure £8,313; Isle of Thanet Electric, £205 increase; Mexico Electric (month of March), receipts £46,200, expenditure £26,400; Perth Electric, £18 increase; Port Elizabeth (month of April), receipts £4,292, expenditure £2,281.

Ruabon.—Several memorials have been sent to the company who recently commenced running electric cars between Johnstown (Ruabon) and Wrexham, asking them to discontinue running the cars on Sundays, as the practice led to a great deal of drunkenness in the district. At a meeting of Rhos Council, a letter was read from the secretary to the company, who said that in view of the large number of residents in the district who had availed themselves of the facilities offered by the trams on Sunday, the company could not see their way to discontinue the service. The company had made enquiries locally, and found that the little drunkenness which there was in the district had in no way been increased by reason of the service of cars on Sundays.

Wolverhampton.—A balance-sheet on the past year's working of the Corporation tramways has been issued by Mr. Howell, borough accountant. It shows that the working of the horse tramway section cost £5,478, and the income amounted to £94,654, the loss being £824, without taking into account anything for interest and sinking fund on borrowed capital. On the electric traction system there was spent last year £12,670, and the income was £21,352, the gross profit being £8,682. The interest and sinking fund on both the horse and electric traction had been charged against the income from the electric section. The deficit of £824 upon the horse trams had been wiped off, £2,000 had been set against depreciation, and the total loss on the year's working of the two systems was £256.

District Railway.—Last Wednesday week the electrically-equipped section of the District Railway from Harrow to Ealing broke down by reason of failure of current from the temporary generating station at Alperton. A single coach drawn by ordinary steam-engine brought the belated passengers from the City on Wednesday night. By the following day repairs had been made and traffic was resumed. Mr. Bonar Law, replying to Mr. Weir in the House of Commons on Wednesday, said that the company informed him that the railway between Mill Hill Park and South Harrow—about six miles—had been regularly worked by electric traction since June 28. The company added that the working of the main line by electric traction depended on the date of the completion of the power house at Lot's-road, Chelsea, which was being pushed forward with the greatest possible speed.

Digitized by Google

Birmingham.—At the meeting of the City Council on Tuesday it was unanimously decided to appoint at once a tramway manager, and, in order to secure the best possible man for the position, it was decided not to advertise in the ordinary way or to fix a salary, but to leave the selection entirely in the hands of Alderman Beale and his colleagues on the Tramways Committee. The Council also decided to give notice to the City Tramways Company to surrender certain lines in a portion of Birmingham which was not within the city when the lines were constructed; and Alderman Beale foreshadowed the electrical equipment of the whole of the lines within the next two years, and a workable agreement with the tramways company, the British Electric Traction Company, and the outside authorities. Probably the first section to be reconstructed will be the Aston-road section.

York.—The City Council have had two proposals submitted to them by the tramways company as to the electrification and extension of the tramways in the city, and have decided not to entertain either. The committee, in recommending this course, were unanimous that it would be unwise for them to lose control of the streets, and to come to any arrangement or agreement with the tramways company which would cause that. It was stated at the meeting that the Council had a mandate from the citizens a comparatively short time ago in which they refused leave to the Corporation to take over the tramways, and some of them thought it too soon to approach the matter again. Very great changes were also looming in the future with regard to electric traction and the introduction of motor 'buses, and it would not be wise for them, even if they had an agreement with the tramways company, to incur a large expense in pulling down corners of streets so as to improve them for electric traction. They therefore thought that it would be well to delay the matter a little while longer.

Hampstead.—At the last meeting of the Borough Council it was decided to comply with the request of the London County Council on the subject of the suggested reconstruction for electrical traction of their northern tramways, to give directions that any electric lighting mains laid in the carriageway of thoroughfares where there are tramways, or which are likely to form part of tramway routes in future, shall be placed as near as possible to the kerb, and that mains crossing the carriageway be laid at a depth of not less than 3ft. 6in. below the surface. The General Purposes Committee recommended that, with reference to the letter from the clerk to the London County Council, stating that the Improvement Committee had again under consideration the suggested widening of Edgware-road, High-road, Kilburn, and Shoot-up-hill, in connection with the proposal to construct a tramway from Marble Arch to Cricklewood, and asking this Council to contribute a third (amounting to about £15,213) of the net cost of the necessary street wideningș, the London County Council be informed in reply that this Council are not prepared to contribute towards the cost of the proposed scheme. The recommendation was adopted.

Hull.—From the report of the city treasurer (Mr. Milner) for the year ending March 31 last, it appears that the expenditure for the electric tramways on capital account during the 12 months has been £30,490. 15s. 9d., making a total to date of £341,042. 8s. 5d., subject to the addition of the proportion of cost of paving works in course of progress. The sinking fund has been increased by instalments charged to revenue and interest on accumulations, making together £9,622. 10s. The income from fares has been £91,491. 16s. 10d., against which the working expenses and maintenance have been £48,088. 2s. 3d., leaving a net revenue of £43,403. 14s. 7d. Out of this have been met charges for interest, £9,082. 15s. 6d.; sinking fund, £9,147. 14s. 3d.; and £10,673. 4s. 10d. has been carried to the reserve fund. The remaining £14,500 will be carried to the city fund for the relief of the rates. The working expenses have been 52·56 per cent. of the receipts, compared with 53·42d. per cent. the previous year. The number of passengers carried was 22,062,703, the highest number in one day being 172,521 on Aug. 9 last. The amount to the credit of the reserve fund is now £36,572. 18s. 9s., being 10·7 per cent. of the outlay on works.

Southport.—A big fight is being waged here on the question of a Sunday tram service. On Saturday a *plébiscite* of the ratepayers was taken, and nine wards out of ten returned majorities against, the total figures being 1,843 for and 3,639 against—majority against, 1,796. All the clergy and minsters have taken a decided stand in opposition to the proposal. Their victory, however, is only a prelude to a campaign. On Sunday the whole town was astonished by the Southport Tramway Company, in which the British Electric Traction Company have a controlling interest, running a service in Lord-street, the principal thoroughfare. A clause in their lease says they cannot ply for hire on Sundays without the sanction of the Corporation. Accordingly, passengers were granted free tickets for the Southport portion of the journey, and treated as "guests" of the company. On arrival at the Birkdale boundary they pay their fares. A Gilbertian situation could be created by passengers travelling half way without paying, but the conductors could reserve to themselves the right of saying who will be guests. Last year the company lost over £2,000 on the undertaking, while the Corporation system lost £1,200. Before the poll was taken much amusement was caused by the company profusely placarding their cars with lists of churches and chapels along the route which would be benefited by a Sunday service. The chairman of the Corporation Electricity Committee declined on Saturday night to supply current, and the company have connected wires with the Birkdale system.

District Railway (Various Powers) Bill.—The Select Committee of the House of Lords presided over by Lord Ribblesdale concluded its consideration of this Bill on the 3rd inst. In the case of the petition of Messrs. Van Noorden and Co., ivory cutters, whose premises adjoined the proposed new railways between Mark-lane Station and Minories Station, and who feared damage arising from increased vibration, the committee, after hearing Mr. Brereton, engineer to the District Railway Company, and Sir A. Binnie, declined to grant the request of the petitioners for the insertion in the Bill of a vibration clause, but agreed to a clause to the effect that the company should not take any portion of their premises. Several outstanding points on the petition of the London County Council were then discussed. The most important of these had reference to the construction of certain station works proposed to be executed by the District Railway Company under Whitechapel-road. The County Council expressed a fear that these works would interfere with, and possibly prevent, the electrification of their existing tramways on the conduit system, and they asked for protection in this respect. Mr. Pember, K.C., on behalf of the District Railway Company, brought up a clause undertaking that these station works should not be constructed at a level higher than their existing works. The committee agreed to this clause. The committee found the preamble of the Bill proved. The clauses were gone through and adjusted, and the Bill, which has already passed through the House of Commons, was ordered to be reported for third reading.

Municipal Trading.—The parliamentary enquiry into the question of municipal trading was resumed in the Houses of Parliament on Monday, the Earl of Crewe presiding. Mr. James Dalrymple, accountant to the Glasgow Corporation tramways, said all moneys required for capital purposes were borrowed under the provisions of the Glasgow Tramway Acts, 1872 to 1901. Their net borrowing powers authorised were £2,043,197. To May 31, 1903, the total tramway revenue was £656,572, of which £653,199 was derived from passengers. The average total revenue per car mile was 11·25d. The working expenses amounted to 7·40d. per car mile. A sum was charged for the renewal of the track calculated at the rate of £450 per mile. This sum was carried to a renewal fund, to which all sums actually expended in renewals were charged. This fund now stood at £136,789. In addition to this a further sum of £74,038 was charged to revenue to meet the year's depreciation on plant and equipment. After deducting every item of expenditure there remained a credit balance of £224,702. The balance of £100,276 still remaining was regarded as the net surplus of the year's working. Street improvements had not been carried out to benefit the tramways as suggested. The Tramway Committee kept up the centre of all streets in which tramways were laid to a width of 17ft., and was quite prepared to pay the proper proportion of the cost of street improvements. Last year the tramways department was the fifth largest ratepayer in the city. This year the department would be the second largest ratepayer. The principle adopted by the Corporation in regard to depreciation was to provide out of revenue annually a sum sufficient to reinstate the subject at the end of its estimated life. This sum was always charged against revenue as a working expense. The amounts formed a deduction from the capital cost, and was applied in the reduction of debt. The annual sinking fund formed a charge against net revenue, and was charged to meet depreciation. The result would be that at the end of the period for the repayment of the debt the Corporation would have a tramway system in perfect condition and free from debt. The committee adjourned.

Aberdeen.—The tramway accounts for the year ended May 31 last have just been issued, showing a very healthy and promising state of affairs. The revenue amounts to £50,986. 0s. 7d., as compared with £37.035. 17s. 10d., an increase of £13,950. 2s. 9d. over the revenue of last year. The average income per mile is put at 12·66. Then, against the income of £50,986. 0s. 7d., there has to be put the working expenses, totalling £27,571. 4s. 6d., compared with £26,577 last year, leaving a profit on the actual working of £23,414. 16s. 1d. to be carried to the net revenue account, an increase of £12,059. 19s. 11d. over, and more than double, last year's profit. The working expenses include: traffic expenses, £10,642. 9s. 1d. (2·647d. per mile); electric current, £7,644. 19s. 11d. (1·898d.); maintenance and repairs, £5,183. 7s. 2d. (1·287d.); general charges, £2,910. 11s. 5d. (·721d.); and depreciation on cars, plant, office furniture, and buildings, £1,189. 16s. 11d. (·295d.). The average working expenses per mile works out at 6·85d. The balance of £23,414. 16s. 1d. carried to net revenue account is disposed of thus: interest on mortgages and loans, bank interest, and commissions and stamp duty, £7,666. 8s. 6d. (last year, £6,111. 11s. 1d.); amount written off preliminary and parliamentary expenses, £734. 3s. 4d. (£734. 3s. 4d.); carried to credit of sinking fund, £1,884. 5s. 2d. (£1,201. 2s. 2d.); carried to credit renewal account, £8,458. 18s. 9d. (£1,708. 1s. 6d.; capital account, written off value of old horse cars, harness, and horses, £4,671. 0s. 4d. Turning to the capital account, the amount debited for the year is £38,849. 18s. 9d. The amount of capital account carried to balance account is £259,597. 0s. 5d. The liabilities fully met by assets in the balance account amount to £271,162. 3s. 3d. An interesting table embodied in the report gives the details of the traffic returns week by week for the year to May 31 last. The best week was that ending July 19 of last year (the exceptional week on which the Highland and Agricultural Show was held on the Links), when £1,647. 16s. 1d. was drawn, representing 380,953 passengers carried. Leaving that week out of account for the sake of comparison, we take the next best week, ending Aug. 2 last year, when the sum drawn was £1,299. 10s. 7d., representing 292,597 passengers carried. In the previous year the high-water mark was reached on July 27, when the weekly receipts amounted to £1,064. 8s. 8d., representing 245,621 passengers carried. The total mileage covered in the year was 966,859 miles, the average number of passengers per car mile being 12·57, and average receipts per passenger 0·99. It is proposed to erect a new car depôt at an estimated cost of £4,800, and workshops and stores at £4,200.

London County Council.—At the meeting of the London County Council on Tuesday a long debate took place with reference to the relative merits of the conduit and overhead systems of electric traction as applied to tramways generally, and to the lines in North London in particular. Mr. Sidney Low opened the discussion by adducing a number of objections which he said could be urged against the conduit system. Its construction involved an enormous disturb-

Digitized by Google

ance of traffic, and in every case it required a much longer time than any other system. They had had some experience of rain, but they did not know what snow would do. Mr. Benn, added Mr. Low, thought there should be a thousand miles of electric tramways in London, and this carried out on the conduit system would mean an expenditure of 12 millions of money. He admitted that London was behind other cities in the matter of tramways, but he objected to spending large sums on a scheme which in 10 or 15 years' time might be rendered obsolete by the motorcar or the trolley omnibus. Mr. Allen Baker defended the conduit system. He admitted that it took longer in construction, but, once made, it involved no further disturbance for years, and as for the difficulties with railway bridges, these could be overcome. As far as South London was concerned, the authorities at Greenwich absolutely prohibited the Council from using the overhead system within a radius of three or four miles, and this referred also to the Commercial-road line. Mr. John Burns, M.P., adduced the experience of two months in South London as evidence in favour of the conduit system, and thought the Council made a mistake in following the main roads so closely, instead of having a single line down one street and a return line up another. Mr. Benn, replying on the discussion, said it had been asked in North London many times why they had had to wait so long for electric trams, but the reason lay with the company, which had refused to surrender its lease at any price, and with the borough councils, which objected to the overhead system. The committee had looked at the question from every point of view, but they could not do as they would like. The report was a compromise, and if any member on the other side could suggest a way out of the difficulty he (Mr. Benn) would be glad to give all the assistance in his power. After further discussion the report was received, and the recommendations of the committee as to the reconstruction of the northern lines (set out in a previous issue) came under debate. In the case of 18 routes the committee recommended that they should be reconstructed on the conduit system, and after Mr. Sidney Low had moved and withdrawn an amendment for reference back the recommendation was adopted. There were 19 other recommendations as to routes which should be reconstructed on the overhead system. Mr. Howell Williams moved as an amendment that the conduit system should be substituted, and, in deference to an appeal from Sir William Collins, Mr. Benn agreed to an adjournment of the debate, repeating his hopes that the Moderates would come forward with some practical suggestion as to the whole matter. At the same meeting the Highways Committee presented a report stating that the reconstruction, for electrical traction, of the tramways (*a*) in Camberwell New-road, between Camberwell-green and Brixton-road, (*b*) in Brixton-road, between Camberwell New-road and Kennington Park-road, and (*c*) in Westminster Bridge-road, from its junction with Kennington-road to St. George-circus, has been completed, and the Board of Trade has consented to, and approved of, the use of electrical power on these lines. The Board has also certified that the tramway in Camberwell New-road, which has been reconstructed as a double line under the powers conferred upon the Council by the Act of 1901, and not under the Electrical Power Act as is the case with the other two lines, is fit for public traffic. The Board has forwarded, with its consent, a copy of a report by Lieutenant-Colonel Yorke, R.E., who inspected the tramways on its behalf on June 24. In his report Colonel Yorke has made certain recommendations, to which effect has been given, as to the method of working the lines. These tramways have been opened to the public, and in order to relieve the traffic in Walworth-road, where the tramways are being reconstructed, arrangements have been made for a through service of electrical cars between Camberwell-green and Blackfriars Bridge, *via* Camberwell New-road.

LIGHTING AND GENERAL.

Maidenhead.—The suggested electric light extension in Ray Park-avenue has been agreed to.

Long Eaton.—The Urban District Council are raising £1,600 in respect of electric lighting expenses.

Bruce Peebles and Co.—Letters of allotment of shares in Bruce Peebles and Co., Limited, have been posted.

Kent and Canterbury Hospital.—Electric lighting is to be installed throughout this hospital at a cost of £300.

Ramsgate.—The Town Council have accepted the terms of the tramway company for the electric lighting of the town.

Sleaford.—The Urban District Council have obtained sanction to a loan of £1,925 in connection with the electric lighting.

Batley.—Sanction has been received to borrow £5,308 for the provision of a refuse destructor near to the electricity works.

Tonyrefail.—It has been decided to form an electric light company, with £1,000 capital, for public lighting and private supply.

London County Council.—The Council on Tuesday agreed to lend the Battersea Borough Council £3,019 for electric light installation.

Watford.—Electricity consumers now number 270, and owing to the increasing demand the Council are compelled to extend the works.

Benwell.—The offer of the Newcastle and District Electric Lighting Company to supply the district with electricity has been accepted.

Southwick.—The Empire Electric Lighting Company intend to make application for a provisional order to supply electricity in the district.

Main Trunk Telephone.—The wires have been put up between Shrewsbury and Aberystwyth, and conversation has been carried on between these points.

Stourbridge.—The Council have decided to apply to the Board of Trade with a view to assuring the non-revocation of their electric lighting provisional order.

Clayton.—The Empire Electric Lighting and Power Company intend to make application for a provisional order to supply electricity for use within the Council's area.

Edinburgh.—The Electric Lighting Committee on Tuesday decided to recommend that the price of energy for each public lamp should be reduced from £13 to £12. 10s. per annum.

Electric and General Investment Co.—Warrants for the half-year's dividend, payable July 1, on the 6 per cent. cumulative preference shares of the Company have been posted.

Erith.—The Erith Education Committee are considering the subject of the electric lighting of all the Council's schools. The St. Augustine's-road new schools are to be first taken in hand.

Kingston (Surrey).—Colonel W. R. Slacke has held an enquiry into the application of the Town Council for sanction to borrow £7,784 for purposes of their electric light undertaking.

Bath.—The Corporation propose to apply to the Board of Trade for a provisional order to supply electricity for public or private purposes in the area of the Rural District Council.

Irvine.—Royal assent has been given to the Electric Lighting Bill promoted by the Corporation. The order provides, *inter alia*, for the lighting of the streets in the burgh by electricity.

Thornhill.—The General Purposes Committee of the District Council have approved the final plans for the erection of a generating station for the Yorkshire Electric Power Company.

Devizes.—The Town Council have decided to apply for an electric lighting order with the intention of, in two or three years' time at the outside, setting up plant for the manufacture of electrical power.

Crewe.—The electrical engineer's last report stated that 7,083 units had been used by consumers and 11,729 in public lighting. The engineer has been instructed to prepare a report as to the cost of placing arc lamps into the main streets.

Overhead Wires.—The London County Council have been asked to insert a clause in their General Powers Bill to prohibit electric current being supplied to consumers within the area of a local authority from an outside source by means of overhead wires.

East Dereham.—The Southern District Electricity Company intend to apply for a provisional order for supplying electricity in the district. This question and the consideration of the provision of a telephone system has been referred to committee.

Clydebank.—The Electric Lighting Committee are negotiating with the Clyde Valley Electric Power Company in regard to certain proposals to supply the street lamps and municipal buildings with electricity, and also to treat the burgh refuse at their works at Yoker.

Willesden Polytechnic Electrical Engineering Society.—On Saturday an interesting paper was read by Mr. H. German on the subject of the society's recent visit to Messrs. Martin and Co.'s electric lighting station. Mr. F. H. Taylor, A.M.I.E.E., occupied the chair.

Stockton.—The Electricity Committee in their last report state that the additions made during the month were equivalent to 1,769 8-c.p. lamps, and on their recommendation it was decided to apply for sanction to borrow £1,000 for the purchase of motors to be let out on hire.

Exmouth.—The District Council have approved of a site for an electric lighting station, and the surveyor is about to interview Messrs. Crompton and Co. and ascertain from them the terms upon which they would take steam from the Council for the purpose of generating electricity.

Stock Exchange Settlements.—Applications have been made to the Stock Exchange Committee to appoint a special settling day in and to grant a quotation to the County of London and Brush Provincial Electric Lighting Company, Limited, £250,000 4½ per cent. second debenture stock.

Cheltenham.—The borough electrical engineer in his last report states that all work, both of extensions and ordinary running, has progressed satisfactorily. There are 700 customers, with the equivalent of about 42,600 8-c.p. lamps, connected to the private supply mains, and applications for supply to about 600 more 8-c.p. lamps are in hand.

Wallasey.—In our last issue we gave some particulars in reference to the proposed alteration of charges for electrical energy in Wallasey, in the course of which it was stated that the price was to be altered from 5d. to 6d. per unit, instead of the other way about—*i.e.*, the price is to be reduced from 6d. per unit to 5d., subject to a reduction of 2d. for all supply above two units per quarter for each 8-c.p. lamp, etc.

National Electrical Contractors' Association.—Successful meetings of the Northern Section of the National Electrical Contractors' Association were held at the Grand Hotel, Manchester, on the 4th inst. Members were present from all parts of the North of England, and many important matters, including registration and training of workmen, municipal trading, etc., were discussed. It was reported that good work was being done by all the local associations. The hon. secretary is Mr. W. Cross, 4, St. Nicholas-buildings, Newcastle.

New Palace Steamers.—Last week "La Marguerite" commenced her cross-Channel trips for this season, taking a large number of passengers from Tilbury to Ostend and back. The vessel performed the journey in her usual good style, doing the 220 miles (the distance for the return journey) in just over 10 hours, including a call at Margate. On Monday the "La Marguerite" made a special trip to the English Channel to meet the fleets escorting the President, and accompany them to Dover, and the passengers thus had an opportunity of joining in the welcome to M. Loubet. The popular husbands' boat trip to Margate was resumed on Saturday by the Palace steamer "Koh-i-Noor," enabling City business men to take the fresh-air route to the seaside after the usual Saturday office hours.

Digitized by Google

Dublin.—At the last meeting of the City Council the suspension of the standing orders was proposed with the view of taking up the consideration of the report of the Lighting Committee. The result of the voting was 41 for and 18 against, which was not sufficient, as the motion required a majority of three-fourths.

Buralem.—At the last meeting of the Town Council a scheme for lighting the town by electricity was provisionally adopted. The cost, it was stated, would be about £20,000. It was decided to withdraw all opposition to the North-Western Electricity and Power Gas Bill, as amended in the House of Commons Committee.

St. Pancras.—Nearly 40 tenders have been received by the Guardians for lighting the Highgate Infirmary by electricity. The whole matter is before the Infirmary Committee for report and recommendation. The committee have been given power to consult Mr. Baynes, electrical engineer to the Borough Council in its consideration of the tenders.

Dewsbury.—The electrical engineer in his last statement reported the consumption of 7,457 units of electricity for lighting purposes and 15,031 units for the tramways during the fortnight ended June 20. For a similar period last year 5,894 units had been used for lighting, and in the preceding fortnight 17,494 units had been used by the tramways.

Winchester.—At the Rural District Council meeting on Saturday a letter was read from the secretary of the Inland Waterways Company, Limited, giving notice of their intention to apply to the Board of Trade for a provisional order to supply electricity within this district. It is intended to utilise the water power of the Itchin and its tributaries.

Pudsey.—The Corporation have only till August to execute their electric lighting order. The Council have approved of a £7,000 scheme, but later a new scheme, involving an outlay of £17,000, has been discussed. Now an electric supply company have given notice that they intend to apply for powers to supply electricity in the Pudsey district.

Sports.—On Saturday the B. E. T. Club held their third annual sports at Wormholt Farm, and, favoured by splendid weather, managed to pull off a large number of well-contested prizes which had been presented by the directors of the company. The excellent T Division police band, under the conductorship of Mr. J. Stewart King, played on the lawn.

Canadian Cables.—The Canadian Minister of Finance has announced his willingness to offer a subsidy of 15,000dol. for the institution of a cable news service to provide the Canadian newspapers with the news, opinions, and comments of Europe as viewed from a Canadian standpoint. At present most of these reports are received through the United States.

Blaydon.—The question of the electric supply is still under discussion. The County of Durham Electric Power Distribution Company intend to apply to the Board of Trade for a provisional order to supply the district. Arrangements have also been made to form a company called the Priestman Power Company, Limited, for the same purpose, and Mr. C. H. Merz, of Newcastle, has been appointed consulting engineer.

London Gazette.—At an extraordinary general meeting of the Electrical "Lumiscriptor" Company, Limited, held at 33, Henrietta-street, Covent Garden, London, W.C., on July 2, it was decided that the company be wound up voluntarily, and that Mr. R. Warner, 10, Walbrook, E.C., be appointed liquidator. A receiving order has been made out in the estate of H. J. Furniss, electrician, 5A, Queen-street, Derby, on debtor's petition.

Newport (Mon.).—A considerable extension of the Orb Works, Newport, owned by Messrs. Lysaghts, Limited, is in contemplation, and the proprietary are negotiating with the Corporation for the supply of a large amount of electric power from the Corporation station, which is situated near the works. The installation of the new electric plant at the workhouse was switched on by Major D. E. Williams, chairman of the Board of Guardians, at the union last week.

Arbroath.—The Electric Lighting Committee recently reported to the Town Council that the cost of laying the electric light in the compulsory area under the provisional order would be £20,000, and that at the end of two years it would be optional on the part of anybody outside the compulsory area to apply for its extension, which would make the cost £40,000. It has now been decided that for financial reasons, and in the prospect of the introduction of a large scheme of water supply, the best possible terms be arranged with a company for carrying through the work.

Pontypool.—On Thursday Messrs. R. Algar and Sons, Dock-street. Newport, gave a dinner of the members and officials of the Pontypool Board of Guardians in celebration of the completion of the laying down of the electric lighting installation in the workhouse at Griffithstown. The contract was for £755, and the plant consists of 345 lamps, incandescent lamps throughout, high-speed vertical engine (directly coupled to a generator) of 45 b.h.p., making 350 revolutions per minute. The mains are all laid underground, and the different buildings are controlled from the switchboard in the engine-house.

Luton.—The electrical engineer in his last report states that since May 22 last 5,026 units had been generated, an equivalent to 135 8-c.p. lamps connected, making a total of 103 consumers with 7,402 lamps and 16 motors of 48 h.p., and that at the present time over 900 additional lamps and 12 motors of 29 h.p. were being wired. He also reported that the number of units generated shows an increase of 116 per cent. over the number generated during the corresponding period of last year. Extensions of mains at an estimated expenditure of about £400 have been agreed to, and the Finance Committee will take up the sum of £2,500, being one-half of the amount for which sanction has been obtained.

Reading.—The Highways and Lighting Committee, after considering the offer of the Reading Electric Supply Company, Limited, stating the terms upon which the company would be prepared to light certain of the streets in the town by electricity, have resolved that it is desirable that the tramway routes in which "ducts" for electric lighting have been laid should be lighted by electricity if favourable terms can be arranged with the Reading Electric Supply Company, Limited, for the purpose, and that it be referred to a sub-committee consisting of the chairman of the committee and Councillors Bonny, Cox, and Venner to confer with the company on the subject and to report thereon to the committee at their next meeting.

Electrical Transmission for Slate Quarries.—The Park and Croesor Quarry Company are now putting down an electrical generating plant for supplying power throughout their quarry at Penrhyndeudraeth, North Wales. Messrs. Gilbert Gilkes are supplying the turbines, the whole of the electrical work being carried out by Messrs. Witting, Eborall, and Co., Limited, of Temple Bar House, E.C. The generating station is equipped with a turbine-driven three-phase alternator, capable of giving 200 kw. at a pressure of 2,750 volts. The exciters are separately driven, and the installation includes a high-tension power transmission line for supplying power to the quarry for driving motors, haulage and pumping gear, and one locomotive, all of which are being supplied by Messrs. Witting, Eborall, and Co., Limited. The whole of the work is being carried out to the specification of the quarry company's engineer, Mr. M. Kellow.

Tipton.—At the last meeting of the Urban District Council Mr. W. O. Foster, solicitor to the Council, reported the satisfactory issue of the negotiations between the Council and the Midland Electric Corporation, which had been going on during the past three years. They differed as to the construction of the agreement of 1898, and they had had to promote a provisional order and to appeal to a Board of Trade enquiry. The verdict of the latter was entirely in their favour, and thanks to the mediation of Mr. W. W. Doughty an agreement had been come to. The Midland Electric Corporation would pay the whole of the costs connected with the provisional order and antecedent thereto, and also the costs of the enquiry. They would pay a lump sum of £600, a sum of £50 for the year next ensuing, £150 in each of the next two years, and £200 a year for the remainder of the 21 years, in addition to 30s. a week for a meter inspector. The agreement was sealed.

Dudley.—From the report of the municipal electrical undertaking for the year ended March 31 last, it appears that the loans sanctioned and borrowed since June, 1899, amount to £63,500, of which £2,701 had been repaid. The total expenditure had been £67,392, comprising £22,567 for the year ended March 31 last and £44,825 for 1902. The following are the principal items of expenditure on the capital account for the year ended March last: buildings, £1,503; machinery, £90,941; mains and services, £7,717; motors, £312; arc lamps for pubic lighting, £1,049; engineer's fees, £940. On the supply account for last year the expenditure had been £4,409 and the income £8,929, leaving a gross profit of £4,519. The income included £7,781 for sale of current, £649 for public lighting, £325 claim from the General Electric Company *re* meters. Of the £4,519 gross profit, £1,429 had been absorbed by interest on mortgage loans, £1,375 repayment of loans, £526 bankers' charges, leaving a net profit for the year of £1,186.

Primitiva Gas and Electric Lighting Co.—The *Financial Times* says it is reported that the undertaking of the Primitiva Gas and Electric Lighting Company of Buenos Ayres is about to pass into the hands of the Germans, who, not content with carrying on a large electric lighting undertaking at Buenos Ayres, recently absorbed their French competitor in that city, and now propose to extinguish their English and sole remaining rival in the Argentine capital. Acting on behalf of the German Transmarine Electricity Company, representatives of the Allgemeine Electricity Company of Berlin have been, it is said, engaged during the past few days in London in bringing negotiations with the Primitiva Company to a conclusion, and it is stated that an arrangement has now been arrived at. One report declares that the English undertaking is to be bought outright for £600,000, but another asserts that the enterprise is not to be sold, but is to be leased to the German Transmarine Electricity Company for a long period of years. The latter company's capital is largely held by the Berlin Allgemeine Company and the Union Electricity Company, which will be remembered as having recently established a community of interests for 35 years.

New Issues.—The Oriental Telephone and Electric Company are making a new issue of 50 000 6 per cent. cumulative preference shares of £1 each. The company was originally formed in 1881 to work the telephone patents of Thomas Elva Edison and Alexander Graham Bell, in the East. In 1892 that company took powers to undertake electric lighting, and the name was altered to the Oriental Telephone and Electric Company, Limited. In 1894, in order to effectuate an arrangement between the holders of vendors' shares and the holders of ordinary shares the company transferred its undertaking to the present company. The company possesses telephone exchanges in Madras, Rangoon, Moulmein, Singapore, and Mauritius, and being the successor of the parent company of the following companies, which were formed over 20 years ago, is very largely interested in them: the Telephone Company of Egypt, Limited, the China and Japan Telephone and Electric Company, Limited, the Bengal Telephone Company, Limited, and the Bombay Telephone Company, Limited. The company has also an electric lighting branch established in Calcutta, and carries on electrical business in connection with each of the above-mentioned exchanges. The company and its subsidiary companies in India have recently obtained from the Government of India renewals of their telephone licenses from April 1, 1903, for a period of 60 years, subject to certain equitable conditions of optional purchase by the Government after a lapse of 20 years. The companies have under-

Digitized by Google

taken in consideration of these licenses to metallic circuit their systems. The Telephone Company of Egypt, Limited, has just completed the underground cabling of its systems in Cairo and Alexandria.

Fulham.—The following report has been received from the borough electrical engineer: "I beg to report that we have had serious trouble with certain switch boxes which are at present installed on our mains. These switches are of two kinds—one for use in brick pits in the streets, for sub-dividing the high-tension circuits; the other switch is used in the sub-station for controlling the high-tension side of the transformers. On Friday last, one of the street switches, at the corner of Kingwood-road, broke down completely, setting fire to the material in the box. We were notified of this by a police constable. Owing to the nature of the damage, we were compelled to cut out the section and reconnect it temporarily. I am glad to say this did not affect the supply very considerably. On looking up the books I found that the same switches had given trouble on three other occasions, which had caused a complete shut-down of the circuit to which attached. Three of these switches have been taken out and replaced, including the one which broke down last week. There still remains in the streets five or six others of the same type. I now wish your instructions for me to take these out and replace them by others of a more suitable type. I believe the cost of these switches was originally £18 each. The ones which I propose to fix would cost about £8 each. The second switch which is used in the sub-station broke down on May 26 last, and was completely destroyed. This caused a shut-down on the circuit for over an hour. Previous to this I find that this switch had several times given trouble, and on March last one of them broke down at Hurlingham, and was so damaged that it was necessary to take it out and replace it with temporary apparatus. I strongly advise the replacing of these switches by others of a more up-to-date type, and which could be more safely handled. As the matter was most pressing I have already put in hand a set for the Claybrooke-road sub-station, at a cost of £8 each. We have eight sub-stations on circuit, each containing two of these switches. All these would need to come out and be refitted. It is essential that this be done immediately, before the winter load comes on, and I trust you will not hesitate to pass my requirements immediately, as it takes a considerable time to get these delivered." It has been decided that accordingly 16 sub-station switch boxes be obtained at a cost of £8 each, and six street switch boxes at an estimated cost of £10 each.

COLONIAL NOTES.

Melbourne.—Electric lifts are making steady progress and the demand for small motor power greater than present supply is able to meet.

Ballarat.—Works of proposed electric tramways and improved and extended system of lighting in the city of Ballarat are still at a standstill, but it is expected to start the tramway plant erection very shortly.

Geelong.—Extension of private lighting and motor power in this city is steadily going ahead. The lock-up and gaol are lighted by electricity. About 250 5-c.p and 16-c.p lamps are installed in latter, giving every satisfaction as regards uses and economy.

Wireless Telegraphy.—Great interest is shown in this matter in Australia, but beyond a few feeble attempts with unsuitable apparatus, which as a result have given poor effects, there has been nothing seriously attempted to prove the suitability of adopting the system along the coasts and between the islands. In this direction there is a great future for wireless telegraphy in Australasia.

Meeloort (Charlotte Plains, Victoria).—The system installed here is high tension of 6,600 volts, three-phase, transforming down to 440 volts for motors and 110 for lighting. There are motors at present pumping for two mines—viz., New Havilah and Pioneer—shifting 6,000,000 gallons of water per day, pumping 24 hours. The electrical weekly output is about 79,000 units. American Buckeye engines are used, and alternators of the General Electrical Company.

Bendigo.—The tramways are giving great success. There is a double line from View-street to High-street, Eaglehawk, and from there a single line to Bernard and View streets, Bendigo. In the town of Bendigo there is a double track in View and Mitchell streets and in portion of Pall-mall. Fares are 1d., 2d., and 6d. on the Eaglehawk line. Extensions are to be made to Golden-square and White Hills. A single track to cemetery is just being completed. Steel poles are used in the town to carry the trolley wires. These were supplied by Messrs. Prescott and Co., of Manchester. Obtside of the town belts wooden poles are used. Track rails are fixed in concrete and granite blocks, and is undoubtedly one of the best laid down in Australia. At the electric power station Browett-Lindley engines are used with Silvertown dynamos. Tension about 550 volts (about 500 used on tramway). The switchboard, cars, sheds, offices, and all parts that go to form the whole system are very complete and in every way up to date. All feeders are laid underground, both for trams and lighting. The voltage is 500 for trams and 440 for lighting and motor purposes. Public lighting is now being changed over to new Crompton lamps of 1,200 c.p. placed on suitable arms on the trolley poles in centre of track; the lamps are in series of nine across the 440-volt cables.

Cable Communications.—The Eastern Extension Company has secured a Federal Government agreement. This means that what is known as the "Adelaide agreement," and which Canada objected so much to, will now operate throughout Australia. The agreement is subject to ratification by the Federal Parliament. There, however, is no doubt that such will be easily given, as there is now a great reaction in favour of the company. The public have secured all they require in the cheapening of cable rates, and though the battle against the company has been a severe one, they deserve all they have won owing to the generous manner in which they have met the public demands. This agreement permits the company to open their own public offices throughout the States of the Commonwealth, and thus deal direct with their customers; but, in addition, it allows them to have their own land lines between the capitals of the States—a valuable concession, by which the public as well as the company will greatly benefit. The Pacific cable has had and lost its opportunity, the chances of which were flitted away through want of proper management. Feeling is bitter against such indifference, and it has been suggested to take away the control from a board and place the management and control of the cable amongst the postmasters-general of the self-governing States interested in the venture. Something will have to be done, and that very soon, as Australia cannot afford to lose over £30,000 a year and grin and bear the loss.

PROVISIONAL PATENTS, 1903.

JUNE 29.

14380. Improvements in or relating to contact breakers for induction coils. Herman Willem van Raden and Carey Burt Robinson, 18, Hertford-street, Coventry.

14476. Improvements in or connected with arc lamps. John Llewellyn Davies, 40, Chancery-lane, London.

JUNE 30.

14500. Improvements in overhead equipment for electric traction, applicable also for use with other exposed conductors. Herbert Smithson and Edgar Ravenhill Sharpe, 6, Bank-street, Manchester.

14537. A new or improved electrically-lighted club for theatrical and like displays. Thomas Hamblet Davies and George Bert Davies, 7, Staple-inn, London.

14539. Improvements in armature coils for dynamo-electric machines. The British Westinghouse Electric and Manufacturing Company, Limited, Westinghouse-building, Norfolk-street, Strand, London. (The Westinghouse Electric and Manufacturing Company, United States.)

14541. Improvements in galvanic dry cells. Georges Schauli and Wolf Loewenstein, 16, Devonshire-square, Bishopsgate-street, London.

14542. Improvements in controlling devices for electric motors. David Leonard Lindquist, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

14543. Improvements in holders for telephone directory cards and the like. Charles Elmer Napp, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

14550. Improvement in lifeguards for electric cars and other vehicles. John Farrer Mason and Harry Kremnitz, 8, Quality-court, Chancery-lane, London.

14551. Improvements in electric controllers for motors and the like. August Sundh, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

14555. Improvements in controlling devices for electric motors. David Leonard Lindquist, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

14555. Improvements in and relating to electromagnets. David Leonard Lindquist, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

14560. Improvements in oil switches. Henry Price Ball, 18, Buckingham-street, Strand, London. (Complete specification.)

14561. Improvements in automatic circuit breakers. Henry Price Ball, 18, Buckingham-street, Strand, London. (Complete specification.)

14562. Improvements in circuit breakers. Henry Price Ball, 18, Buckingham-street, Strand, London. (Complete specification.)

14568. Improvements in electric switches. Henry Price Ball, 18, Buckingham-street, Strand, London. (Complete specification.)

14566. Improvements in means for electrically driving centrifugal engines. Herbert John Haddan, 18, Buckingham-street, Strand, London. (The American Tool and Machinery Company, United States.) (Complete specification.)

14575. Improvements in holders for electric incandescent lamps. Peter Kleber, 65, Chancery-lane, London. (Complete specification.)

14597. Improvements in machines for making bases for electric lamps. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

14596. Improvement in electric motor-driven machine tools. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

14601. Improvements in coin mechanism specially applicable for electricity and other meters. Edward Du Bois, Norfolk House, Norfolk-street, Strand, London.

14602. Improvements in coin mechanism specially applicable for electricity and other meters. Edward Du Bois Norfolk House, Norfolk-street, Strand, London.

JULY 1.

14610. A dynamo-electric generator for the production of high-voltage continuous currents without commutation. Frederick Hamer, Anchor Bridge House, Hayes, Middlesex.

UNIVERSITY

NOTES.

Society of Arts.—Notice is given in the *Journal* of the above society that on Monday, the 6th inst., at their first meeting, the council elected Sir Wm. Abney, K.C.B., D.C.L., F.R.S., as chairman for the ensuing year. The various committees were also reappointed.

Literary Notice.—Messrs. Spon, of London and New York, are about to publish a new work by Mr. William R. Bowker, M.I.E.E., entitled "Practical Construction of Electric Tramways." Mr. Bowker, besides being a civil engineer, is lecturer on physics and electrical engineering at the Halifax Municipal Technical School.

Automobilism in Ireland.—The members of the Automobile Club have all but completed their engagements in connection with their fortnight's tour in Ireland. At the end of last week Cork was made the centre of attraction, and some interesting speed trials were successfully carried out over a two-mile straight and level course in the western suburbs of the city. The competitions again excited keen enthusiasm, and the same may be said of the trials which have taken place during the present week They included a motor boatrace at Cork and further hill-climbing contests at Killarney. Some 60 cars are taking part in the tour through the South of Ireland.

Emanations of Radium.—Researches are being made by Sir Wm. Crookes and Prof. Dewar into the effect of extreme cold on the emanations from radium. To detect the emanations, the experimenters allowed them to scintillate on a blende screen. It was observed that cold produced by liquid air stopped the emanations, but this was found to be owing to the effect on the screen, not on the radium. Sir William and Prof. Dewar have also observed in the course of the experiments that the property possessed by radium emanations of rendering the air a better conductor of electricity is not lost at the low temperature of liquid hydrogen. An electroscope charged with electricity leaked into the air when radium in a tube of liquid hydrogen was brought near to it.

Electricity in Train-Lighting.—Speaking of electricity in a report on the railways of India, prepared at the instructions of Lord Curzon, Mr. Robertson regards it as specially adapted for lighting trains in India on account of the absence of heat. He remarks with truth that the electric lighting of trains has passed beyond the experimental stage. It effects considerable saving in upkeep and working expenses, and Mr. Robertson emphasises the fact that English and Continental railways are now adopting the system very extensively. Its introduction on the Indian railways would also permit of fans being provided in carriages during the hot weather at comparatively little cost. The report makes no mention of electricity in its application to railway working, but perhaps the time is not yet ripe for this more recent adaptation so far as India is concerned.

Institution Journal.—Vol. xxxii., Part 1, of the *Journal* of the Institution of Electrical Engineers has been published. It contains the following papers, with the discussions thereon: "A Study of the Phenomenon of Resonance in Electric Circuits by the Aid of Oscillograms," by Mr. M. B. Field, before the Glasgow Section, also abstract of same before the London main section; "Distribution Losses in Electric Supply Systems," by Messrs. A. D. Constable and E. Fawssett; "Divided Multiple Switchboards," by Mr. W. Aitken; "Methods of Supporting and Protecting Inside Conductors," by Mr. O. L. Falconar; "Some Notes on Continental Power-House Equipment," by Mr. H. L. Riseley; "Network Tests and Station Earthing," by Mr. A. N. Taylor; and "Arrangement and Control of Long-Distance Transmission Lines," by Mr. E. W. Cowan.

Telephone Competition at Swansea.—The National Telephone Company are pursuing their usual tactics at Swansea. As was the case at Glasgow, Tunbridge Wells, and elsewhere, they have been forced to lower their tariff in face of the formidable competition which will shortly be offered by the municipal exchange in the provision of an efficient telephone service in the town. The Corporation's system will be opened on Oct. 1, but the company have not waited till then, and are already bringing out a new scheme of charges by which subscribers may have a certain number of free calls for £5 per annum—the same charge as the Corporation propose to make for an unlimited service. The advantage is then on the side of the municipal exchange, even if the natural feeling of gratitude on the part of the citizens to the Corporation for providing them with an efficient and up-to-date service at reasonable rates, were not enough to ensure the popularity and ultimate success of the new enterprise.

Steam-Turbine Installation.—A case has arisen in the States in which trouble is sometimes experienced in a hydro-electric plant by the failure of the water power. It has therefore been decided to instal a steam-turbine, which will be used for relay purposes. Electric power is utilised almost entirely for driving the machinery in the factory, but a small steam-power plant is also employed, which will supply steam for driving the turbine. It is a 540-h.p. machine, taking steam at 165lb. pressure, after it has traversed the distance of 350ft. separating the boiler-house from the engine-house. Before entering the turbine the steam will be superheated about 100deg. F. by means of an independent superheater, fired by waste hydrogen gas rising from electrolytic baths used in the process of manufacturing at the factory. The gas has heretofore been a waste by-product. The steam economy is estimated at about 13·5lb. per electrical horse-power hour, which means about 11lb. per indicated horse-power hour.

Tramway Subways.—Under this heading last week we announced the decision of the London County Council to send its chief engineer to the States this summer to enquire into the methods of construction of tramway subways in that country. By an unfortunate slip we referred to Mr. J. Rider, the Council's electrical engineer, as being the gentleman in question. It should, of course, have been Mr. Maurice Fitzmaurice, who is charged with the construction of the authorised tramway subway under the new thoroughfare from Holborn to the Strand. Mr. Rider has, as our readers know, already been to America to familiarise himself with tramway matters as conducted over there, and the experience he gained two years ago will hold him in good stead in carrying out the electrical work connected with the Council's new venture. We wish Mr. Fitzmaurice all success in his impending visit to New York and other American cities, and trust the information he may gather will prove of value to him in carrying out the important scheme with which he has been entrusted.

Post by Electric Trams.—The system of posting and collecting letters by electric trams, which has been successfully tried in some of the northern towns, is being adopted on the electric tramway system of Sydney, in New South Wales, but on a more extensive scale. The scheme includes the erection of a small clearance office at one of the important termini, and letters as they are cleared will be sent off by messengers to the General Post Office

Digitized by Google

every 15 minutes. In this way, it is believed, communication between the suburbs and the city will be greatly expedited, and this has certainly been the experience of those places which have adopted the system in this country. It is also proposed to arrange for boxes to be put on cars running to the railway station, so that letters too late for the general mail at the Post Office may be posted on any car reaching the station before the departure of the mail train. There is some difference of opinion at present as to the rates to be paid by the Post Office for these privileges, but it is hoped that a fair agreement may be come to which will allow the scheme to be put into operation.

The Telephone in South Africa.—As in most things, South Africa is making good progress in matters telephonic. A long-distance telephone line has lately been put in operation between Johannesburg and Pretoria, and is likely to lead to other extensions. The tariff adopted is fairly liberal in the circumstances. A three minutes' conversation for distances up to five miles costs 1s.; between five and thirty miles, 2s. 6d.; between 30 and 50 miles, 3s.; and between 50 and 70 miles the charge is 3s. 6d. Among the towns in South Africa which are proposing to establish telephone exchanges is Aliwal North, on the border of Cape Colony. Johannesburg, too, is planning a telephone system, or, rather, an extension of the existing system, sufficient to accommodate 10,000 subscribers. The proposal is to put the mines in telephonic communication with the city, which is an undoubtedly enterprising scheme. We understand that the first instalment of the material for the underground work has been ordered from this country, and the work of building up the system will be undertaken in sections extending over a period of two years. Additions to the equipment of the central exchange are also in progress, and arrangements are rapidly being made for an early inauguration of the first portions of the new system.

A Shock of 5,500 Volts.—A Continental exchange describes an extraordinary case in which a workman was subjected to a discharge from a 5,500-volt three-phase circuit for the space of five minutes and survived. He appears to have suffered no permanent injury except to his hands, which were so severely burnt that it was considered that amputation might be necessary. The upper skin of the front and back of the hand, and of the left forearm, was entirely detached from the lower skin, and was completely charred and dried up. The under-skin looked as if it were cooked, and had lost all sensation. The sole of the left shoe was perforated and torn away in places. The unfortunate man was suspended for five minutes from the live wire, and bystanders assert that flames were seen proceeding from his hands and feet Dr. Jellinek, who delivered a lecture on this case to an Austrian medical society, came to the conclusion that 10 h.p. to 12 h.p. raged for five minutes in the body of the unfortunate workman, but, in making this calculation, it is doubtful whether he made sufficient allowance for the very high resistance of the charred skin and the leather soles of the boots. It is, however, a remarkable fact that a human being should suffer such a shock under the most favourable conditions and survive.

Institution of Mechanical Engineers. — This institution will hold its summer meeting this year in Leeds, opening on the 28th inst., under the presidency of Mr. J. Hartley Wicksteed. Conference business begins on the morning of that day at the Leeds Philosophical Hall, and will be continued the following day, opportunity being afforded at the same time for visits to a large number of works in the city and district. On the 30th expeditions are planned to Doncaster and Frodingham, to Farnley Ironworks, to Normanton, and to Wakefield; while Friday, the following and last day of the meeting, is to be devoted to pleasure excursions to Ripon and York. One or two social functions in connection with the municipality have also been arranged. On the programme of serious business five subjects are down for consideration. Mr. Henry McLaren will introduce a discussion on "Economy of Fuel in Electric Generating Stations." Mr. H. Ade Clark will contribute a paper on "The Diesel Engine," and Mr. Arthur Greenwood one on the "De Laval Steam-Turbine." Mr. R. H. Fowler will deal with the question of "Roofing Existing Shops while Work is proceeding," and Prof. Hele-Shaw is to describe a "New Form of Friction Clutch." Mr. E. Kitson Clark and Mr. Christopher W. James are acting as joint hon. local secretaries to the conference.

Electrical Separation of Metals.—In a note communicated to the Paris Academy of Science, D. Negreano suggests a novel process for separating metallic powders from inert matters. On an insulated metal plate the pulverised mixture is placed, the plate being connected to the negative terminal of a Wimshurst machine. On bringing up to the plate a metal disc connected to the positive terminal of the machine and projecting the pulverised substance in a vertical direction by means of a special blowing machine, the metallic powder is found to be repelled and partly deposited on the upper part of the disc. The separation will occur readily when operating with sand and metal grains; experiments with sand grains and very small copper and bronze grains have shown nearly the whole of the metal to be deposited on the disc. This phenomenon is explained as follows: in the space between the metal plate and disc, the combination of which constitutes an air condenser, the field being uniform, the flux will be perpendicular to the disc; in the neighbourhood of the edges of the disc the lines of force will undergo a bending effect, so that the lines parting from the plate beyond of the surface facing the disc will be curved in towards and made to terminate on the latter, this being the path followed by the metallic particles deposited. The above process may serve in some cases to separate a mixture of finely divided metals. When applied to a mixture of brass and copper particles, for example, experiment shows that the brass will be repelled and deposited on the metal disc. The process may, as well, be applied to separating the metallic part of an ore from the gangue.

Lighting Our Coasts.—The Prince of Wales had some interesting subjects to dilate on when, in his capacity of Master of that ancient corporation, Trinity House, he presided over the annual dinner at the latter end of last week. One of these was the lighting of our coasts, and his Royal Highness truly remarked that scientific discoveries, engineering skill, and mechanical appliances have all contributed to the development of the coast-marking system as it now exists. As the wood and coal fires of the earliest days gave way to candles and smoky oil lamps, so these in their turn have been superseded by very powerful burners with elaborate combinations of lenses, through which blaze beams of light—electric oil, or gas. As the Prince observed, during the last few years much has been accomplished in the development of the lighthouse service, and we may add for ourselves that much of this is due to the improved conditions of lighting obtained through the medium of electricity. His Royal Highness also touched on the question of fog signals, and referred to the experiments which are continually being made with a view to the production of a

Digitized by Google

trustworthy instrument. With reference to wireless telegraphy, the Prince merely repeated the intention of Trinity House to utilise it for communicating between some half a dozen lightships and their respective stations on shore. There is no doubt that wireless telegraphy has an extensive field of application in this direction.

Street-Lighting.—We do not blame the advocates of gas-lighting for making the most of the little material at their disposal in their efforts to discount in the eyes of the public the benefits of street-lighting by electric arcs. There is, however, a limit to all things, and it has surely been reached in the case of Stepney, the facts of which have been brought to our notice. In their energetic campaign in favour of the incandescent gas mantle, these gentlemen have carried the war into the enemy's land. A report has been put in circulation that a petition, largely signed by the inhabitants of Stepney, has been presented to the Borough Council complaining that the arc lighting "is inefficient and a source of danger to the public," and asking that the lamps should be replaced by incandescent gas lamps. We are authorised to contradict this statement absolutely. We strongly suspect the source from which this and such-like reports come, and as they are calculated to prejudice the interests of electric street-lighting generally if allowed to pass uncontradicted, we are happy to be in a position to state the actual facts in this case. The petition referred to was signed by the inhabitants of two small streets in which 13 ordinary gas columns had been converted to incandescent electric lighting, each containing two lamps of 16 c.p. each, and the petitioners asked that these incandescent electric lamps should be replaced by incandescent gas lamps having Welsbach mantles of from 50 c.p. to 100 c.p. As we are informed, the petition had no reference whatever to the arc lighting of the main streets, which are admittedly as well lighted as any part of the Metropolis. In deference to the representations of the petitioners, the Council have decided to try the interesting experiment of lighting one of the two streets referred to by Nernst lamps instead of the ordinary incandescent, and are raising a loan of nearly £3,000 for that purpose.

Tramway Trolley and Guard Wires.—This is not a new subject in this country, but it is now occupying the serious attention of the authorities in New South Wales, chief among whom are the Railway and Tramway Commissioners and the Postal Department. The position in Australia is accentuated by a conflict between these two authorities, and the fact that the Postal Department has power to do as it pleases with postal equipments in the State, irrespective of other authorities. The case for the Railway Commissioners is that, so far as telephone and telegraph wires are concerned, they should be underground, and that the Commissioners should not be forced to put up guard wires over the electric trolley system where the Post Office wires cross. It has been conceded by the tramway authorities that the course proposed by the Postal Department—that of adopting guard wires—might be favourably considered if it could be shown that it removed all element of danger in connection with falling wires, or did not introduce additional dangers. Guard wires, however, are regarded by them as an evil, and an unnecessary one, and it is held that the removal of the causes rests with the postal authorities. In this country the position is very similar. It is practically owing to the attitude of the Post Office that the Board of Trade insists upon the maintenance of some form of guard wire over the trolley wires where the unprotected Post Office wires cross the tramway track. The undoubted disposition of the Board of Trade in this country is in favour of the abolition of guard wires, which are admittedly dangerous things, but, unfortunately, the Board has no control over the erection of Post Office wires. And so matters remain as they are, although in New South Wales the position is being fought out with spirit, and with the one exception of the Postal Department, all the responsible authorities in the State are opposing the introduction of guard wires as a source of danger and accident.

International Exhibition, Manchester, 1905.—It is proposed to hold an international exhibition at Manchester in 1905, and the committee appointed to take the requisite preliminary steps have issued a circular containing the proposals. It will be the first international exhibition held in Manchester, and no other international exhibition is yet announced for 1905. Among the various reasons urged for holding the exhibition are that electric traction has now completely superseded horses on many tramways, automobiles are rapidly growing in favour, and the railways have increased in number and efficiency. Several plots of land quite suitable in size and position are available. The scope of the exhibition will comprise all that is best in industries, arts, and sciences, home, Colonial, and foreign. The classification will not be too general in the industrial section, but due regard will be given to the products of the district, and imported articles which are required and used in the locality. Automobiles will have a special department and a track provided for displays. Endurance and reliability trials will be started from the exhibition throughout the surrounding country. Aerial navigation and submarine boats, in their latest developments, will be fully displayed, together with such novelties as may be discovered in the meantime. In addition to the above, one predominant feature, such as the electric illuminated fountain at the Royal Jubilee Exhibition in 1887, or the Eiffel Tower at Paris in 1889, will be introduced, and several projects are under consideration, but for manifest reasons cannot be mentioned here. The cordial support of the Colonies and foreign nations may be confidently relied upon; informal communications have already taken place with prominent exhibitors and others which leave no doubt on this point. These opportunities properly availed of, and under good management, can only result in substantial benefit to Manchester and district, and also in material advantage to the whole community, and to the consolidation of friendship between the Empire and all other nations.

Electricity in Mines.—A number of members of the South Wales Institute of Engineers have visited the Tredegar Iron and Coal Company's mines and collieries to inspect a recent electrical installation which has been made at the Pochin and Ty-Tryst pits in the Sirhowy Valley. Electrical power is at present being used in these mines underground both for hauling and pumping, but eventually its application will be extended to surface work. The central station has been built about a mile away from the pits at Bedwellty, and three-phase electrical currents are transmitted to the mines at a pressure of 2,000 volts. In the mines themselves three-phase alternating current is used at 40 periods and 500 volts. At the central station the engines are of the horizontal slow-speed type, and are supplied with steam from a range of six high-pressure Lancashire boilers. The generators are of the revolving-field type, excited by a small four-pole shunt dynamo, the engines being coupled by means of grooved pulleys and cotton ropes. The main switchboard is divided up into three dynamo and three exciter panels, and one transformer panel for the Bedwellty pit. Underground cables are laid along the intake roads in steel semi-tubes, filled with solid bitumen, which is compound in all swampy places. But the chief point about the installation, which was laid

Digitized by Google

down by Messrs. Mountain and Scott, is the economical results of its working. At Pochin the plant has been in full use for 12 months, and during this period a saving of £1,500 has been shown in fuel. There was also a saving in repairs of roads, tramways, etc., and altogether the year's experience has more than warranted the adoption of electrical methods at the collieries. With regard to the steelworks, most of the machines are electrically operated, the generating plant consisting of two Westinghouse horizontal compound engines, with a generator mounted on a shaft between the cranks. There are two Babcock and Wilcox boilers, with the Meldrum system of forced draught, and by this means the company are able to con sume waste product in the shape of coke, which previously found its way on to the tips. The electricity is generated at under $\frac{3}{16}$d. per unit, and large economies are resulting from its use, the cost of production in the steelworks being correspondingly reduced.

Electrical Safeguards.—From an electrical point of view there were one or two papers of considerable interest presented at the concluding meetings of the International Fire Prevention Congress in London last week. That which particularly commends itself to our attention was submitted by Mr. E. C. de Segundo and entitled "Electrical Wiring and Fire Risks." The question raised by the author in this paper is one which is always with us, but can hardly yet be said to have found a final solution. Summarising the essential features of a properly-erected wiring installation, Mr. Segundo stated that the first mportant condition consisted in providing that the electric current should be kept within its prescribed bounds, and that if by any unforeseen contingency a way should be opened for the current to trail in any unauthorised direction, the supply should be cut off automatically and instantly. No absolutely trustworthy means had as yet been devised whereby possible trouble due to electricity "out of bounds" could be guarded against, and the efforts of those who were working in the cause of fire prevention should be directed towards bringing about the adoption of the best kind of insulation and the most suitable kind of mechanical protection for the wires. For safety against risk of fire one must, he remarked, depend entirely upon the means adopted for keeping the electric current within its designed sphere of action—namely, the character of the insulation of the wires or the means adopted to prevent contact between wires of opposite polarity. This included the insulation on the wire and the means adopted to guard against mechanical injury and damp. Up to the present nothing had been found to touch best-quality rubber specially prepared to resist the oxidising action of the atmosphere and the deleterious influence of any rise in temperature of the conductor. It was possible, however, that before long a new form of insulator might be introduced upon the English market which, while possessing all the useful properties of guttapercha, was practically indifferent to the action of light and air, and was very much harder than guttapercha. Large quantities of wires insulated with this material had already been used on the Continent with excellent results. The ideal method of wiring a building, in his opinion, was to use the highest class of vulcanised or other suitable rubber insulation with some suitable form of mechanical protection in the way of braiding. Further, to enclose the wires in a continuous system of cold-drawn steel tubes specially selected for smoothness of bore, with joint-boxes inserted at all points necessary to enable the drawing in of the wires to be carried out without injury to their protective covering and to facilitate inspection, withdrawal of any wires for the purpose, if need be, of increasing their size, etc., the whole system of steel tube and joint-boxes being connected to earth. Another informing paper was presented by Mr. Alfred Hands, who took up the subject of "Necessary Safeguards against Fires caused by Lightning." He showed that from the number of lightning discharges accompanying thunderstorms, damage would be very much more frequent but for the lightning conductors in use. Conductors, however, were not always successful. There was a tendency to regard protection from lightning too much as being the mere putting up of lightning conductors True protection from lightning often consisted of a good deal more than the mere erection of conductors. The part that often made the difference between efficiency and non-efficiency was the making of the various connections to bridge over sparking gaps, as well as keeping a safe distance away from metals that it would be dangerous to connect to. For general purposes the system to be adopted must be evolved only after an intelligent consideration of the conditions that might exist in the structure to be protected.

Utilisation of Free Nitrogen of Atmosphere.—At the recent International Congress for Applied Chemistry at Berlin, Dr. A. Frank read a paper on the industrial utilisation of free atmospherical nitrogen. This element, as is known, is an indispensable factor in agriculture, particularly with highly exhausted soil, the annual importation of Chile saltpetre having been as high as 592,568 tons in Germany for the year 1901. As, however, the Chilene saltpetre mines are likely to become exhausted, the price of this so far indispensable material has been unceasingly rising for some years. Now, the same amount of nitrogen as contained in the above quantity of Chile saltpetre may be found in the air column about 100,000 tons in weight, as resting on one hectare of the surface of the earth. The raw material for manufacturing nitrogen compounds has therefore always been present, but the passive behaviour of atmospheric nitrogen opposed a serious drawback to any attempts made in this field. In the latter part of last century, the opinion was generally adopted that nitrogen could not be made to combine with other elements but by electrical means. Berthelot, in 1869, obtained hydrogen cyanide by passing electric sparks through a mixture of acetylene and nitrogen. A commercial operation of these processes, however, became possible only by the modern possibilities afforded for electrical energy being produced on a large scale. The firm of Siemens and Halske, as well as the Americans, Lovejoy and Bradley, would oxidise the nitrogen of the atmosphere to nitric acid by means of large electrical contrivances; whereas Dr. Frank and Dr. Caro, using the carbides obtained as well by electrical means, would convert the nitrogen derived from air into amides and cyano compounds, affording in turn the raw material for manufacturing ammoniacal salts, red prussiate of potash, etc. After having been tested and placed on a scientific basis by many years' work, this process was taken up by Messrs. Siemens and Halske, a great trial plant being installed with the assistance of Dr. Frank and others. The results there obtained, besides fully confirming the outcome of the laboratory tests, led to the manufacture of a novel nitrogen manure, the so-called "lime nitrogen," being a nearly perfect equivalent for both saltpetre and sulphuric ammonia as to its effects as a manure, and particularly suitable for our northern soils. It is now contemplated to manufacture this new manure on a large scale, it being anticipated that the inexhaustible sources of nitrogen thus placed at the disposal of agriculture will make it independent of foreign markets. On the other hand, the electrochemical industry is sure to profit highly by the new

Digitized by Google

process, a novel field for utilising large amounts of power being opened.

Electricity Supply in London.—When in the House of Commons the Government obtained the rejection of the Bill introduced by the London County Council for the purchase of electric supply undertakings and for the supply of electricity in bulk, a promise was given that the Government itself would promote legislation on the subject. This promise would seem to have been fulfilled in the letter if not in the spirit, for the Bill introduced by the Government this session appears to be framed on very different lines from that of the London County Council. From a municipal point of view, the Government's proposals are regarded as being likely to have the effect of placing both the consumer and the local authority more in the hands of the companies than they are at present, while the object of the County Council's Bill was quite in the opposite direction. The situation has been closely enquired into by the Camberwell Borough Council, who, it will be admitted, are probably more nearly concerned than any other metropolitan borough, in view of the recent decision of the Board of Trade giving the County of London and Brush Provincial Electric Lighting Company a monopoly in the Camberwell borough against the wishes of the local authority. The town clerk, acting on instructions, has prepared a report showing the chief proposals of the Government Bill, amongst which are these: compulsory acquisition of land for generating stations, supply in bulk, provisions as to the right of local authorities to purchase, exercise of electric lighting by authorities jointly, provision as to consents of local authorities to grant provisional orders, revision of maximum price, electric light accounts, and supply of electricity to premises having separate supply. With regard to the question of supply in bulk, the Government's proposals seem to satisfy the views of the local authorities, but serious exception is taken to Clause 3, which it is contended seriously interferes with the purchase clause in the Electric Lighting Acts. By this new clause the present provisions of those Acts relating to purchase, and any subsequent Acts authorising special purchase, may, by a provisional order of the Board of Trade, be annulled, and this is regarded as putting it in the power of the companies by such provisional order, if obtained, to destroy all the powers the local authorities now have to acquire the companies' undertakings; all the large London companies may be exempted altogether from purchase, and the monopoly thus indefinitely continued. Another clause in the new Bill permits the Board of Trade to dispense with the consent of the local authority, and this clause repeals the clause requiring such consent to be obtained. Again, Clause 10 is a stand-by clause, which it is argued from the municipal point of view might be used by a company in a very arbitrary manner, and for the protection of large consumers should be carefully modified and re-drafted in the interests of the consumers, and not the company or persons authorised to supply. Summing up the position, it is contended that the general effect of the Bill is to deprive the local authority and the consumer of much of the protection they now have under the general Electric Lighting Acts; and the company, if able to convince the Board of Trade, is enabled, practically, to come into the area of a local authority and conduct business without the local authority having any power of control as at present. The metropolitan boroughs are very naturally alarmed at the position thus presented, and some stiff parliamentary fighting may be expected over the question of the introduction of protecting clauses. The Camberwell Borough Council have so far taken the lead, and are calling to their aid the weight and authority of the other metropolitan borough councils, the London County Council, and the Municipal Corporations Association in an attempt to organise an effective opposition to the Government Bill.

Motorcar Logislation.—Those who have ventured the hope that the Bill for amending the Light Locomotives Act in regard to motorcars will have an easy passage through Parliament will probably have changed their views by this time. Already there are unmistakable signs that the Government's new proposals for regulating motor traffic on the public highways will be met with a considerable show of hostility both in Parliament and among the general community. One of the principal bones of contention would appear to be the question of licensing. The Government's proposal as to this is that only those who drive a car "for hire, fee, or reward" shall be compelled to take out a license. Those who drive for the mere pleasure of the thing are exempted from this condition. For ourselves, we fail to see the distinction. It is admitted that the granting of a license is no guarantee of skill on the part of the licensee, nor could it be argued otherwise; so that the fact that a professional chauffeur plying for hire is the holder of a license is no security to the public against the perils of furious driving, except that on conviction the offender's license may be "suspended, endorsed, or forfeited at the discretion of the court." But even so the public is only partially protected by this limited system of granting licenses, as the greater bulk of automobilists — those moneyed classes who drive for pleasure, and, as evidenced by the proceedings in the police courts, are often the worst offenders in the matter of furious and dangerous driving— are to remain unlicensed, and are only subject to the increased penalties on conviction provided by the Bill. But a fine of £20 is not calculated to have much effect upon the class of men who own cars, and who have the rate of speed absolutely within their discretion, except in such districts as the present 14-mile limit may be retained by order of the Local Government Board. An exception to the argument that all motors should be licensed may perhaps be made in favour of electric broughams, such as are in daily use in London, which are known to have only a limited radius, and are not constructed for high speeds. The question of licensing is, therefore, one which may be expected to arouse considerable feeling and dissension between motorists and the general public. In proposing to place the speed of motorcars in the discretion of the drivers the Government has done a wise thing. It is obviously impossible to fix a hard-and-fast rule which will meet the varying conditions which govern automobilism in different parts of the country. At the same time, if a local authority is of opinion that the present limit should be retained in its particular area, owing to the presence of dangerous conditions, the Local Government Board, on such representations being made to it, may order the enforcement of the limit by the local authority. This condition certainly invests the local authorities with much power, and the Local Government Board will have its hands full if every local authority is to be allowed to apply for special speed limits and to have an official enquiry thereon. On Tuesday the Bill was discussed in a business-like manner in the House of Lords on the motion for the second reading. As foreshadowed above, the chief debate centred round the licensing question, the general feeling being that all motorcar drivers, whether amateur or professional, should be required to take out a license. Indeed, the feeling on this point was so strong that Lord Balfour undertook to amend the clause in dispute so as to extend its operation to owners and other amateur drivers. The Bill was then able to be read a second time without a division.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE.

The annual conference of the Municipal Tramways Association of Great Britain was held in Glasgow last week, commencing on Wednesday and extending over three days. On the opening day the members and delegates were formally received by the Lord Provost (Sir John Ure Primrose) and the Corporation of Glasgow in the City Chambers.

The LORD PROVOST said he had great pleasure in welcoming the association on behalf of the Corporation of Glasgow, which occupied a very prominent place in the development of municipal enterprise. They were probably the first to municipalise tramways on a large scale, and were very fortunate in having as their general manager Mr. John Young, whose reputation extended even beyond the limits of these islands, and whose whole record was one of capable and careful administration. Being the pioneers, had they achieved only a qualified success, other municipalities might have hesitated, but having, on the contrary, achieved what he might honestly describe as a magnificent success, other municipalities had followed in their wake.

Mr. JOHN YOUNG said it usually fell to the president of the association to reply on such an occasion, but as he (Mr. Young) was at home, he would call upon Councillor Smithson, chairman of the Tramways Committee, Leeds, to say a few words.

Councillor SMITHSON thereupon thanked his lordship on behalf of the members of the Municipal Tramways Association and others present for the hearty welcome which had been extended to them. He also thanked the members of the Glasgow Tramways Committee, especially Councillor Walter Paton, their convener, for the opportunity which had been offered of examining the tramway undertaking generally as regarded its equipment.

In acknowledging these latter thanks, Councillor WALTER PATON said his committee had had very great pleasure in making arangements for the conference. He was glad that the members of the association were going to visit Pinkston power station, which was, perhaps, the most complete power station in this country.

The business of the conference was then entered upon in the Council Hall, Mr. John Young, the president, occuping the chair. In the course of his address, the PRESIDENT said that, although their association was founded only a year ago, almost all the corporations eligible had joined it, and had sent the chairman or deputy chairman of their respective tramway committees to represent them at the conference. The membership now numbered 93, and they might fairly enough describe themselves as an association of municipal tramway experts and specialists. They had now within themselves not only the expert knowledge and experience necessary to initiate, but also moving power to carry into effect. Although they were a Municipal Tramways Association, they recognised that most of the questions and problems which they would have to consider and discuss would apply to all tramways, whether operated by municipal corporations or by companies, and to tramway practice generally. They had therefore taken the liberty of inviting the Street Railways Association and the Street Railway Accountants' Association of America, the Union Internationale de Tramways, and the Tramways and Light Railways Association to send representatives to their present conference, and were delighted to see some of those associations represented. The field which lay open to their association was a very wide one. It was coextensive with the great and growing interests of tramways in this country, and those interests now touched the great bulk of our urban and suburban populations. In this country, although we were slower than our friends in America and on the Continent in adopting electric traction, progress had been rapid during the past few years. He supposed we now had about 2,000 miles of electric tramways, while four or five years ago there were only a few miles. The duties and responsibilities of municipalities, especially of the larger ones, were year by year growing in importance. In every department of civil and municipal life higher ideals were being formed as our scientific knowledge increased, and higher standards of efficiency were being demanded all round. That, of course, meant progress; not reckless change or adventure, but solid advancement on lines which were necessarily broadening, but must still be well defined. It was not the time to discuss what these lines should embrace, but they could not help seeing what had come to pass. As a general rule, municipalities in this country had already taken into their own hands such monopolies or public utilities as the supply of water and artificial light and the operation of the street tramways. They also jealously exercised full control of the public streets and highways; they provided public parks, public baths, public markets, and abattoirs; also fire brigades, and hospitals for infectious diseases; they also undertook works of cleansing and sanitation, which had a direct bearing on the comfort and health of the people. Since this was all done with the approval of the community generally, they might take it that the citizens considered it right and proper, and in the public interest, that it should be so. He thought that the object lesson on the operation of tramways on the best commercial lines which the municipalities were now giving to the country, might well make Parliament feel disposed to lighten their own hands, and those of their public departments at Westminster and Whitehall, by throwing more direct responsibility upon the local authorities in connection with their respective undertakings. Perhaps it was the success of municipalised tramways which had of late caused a few people to get up a scare against them. In any case, it had been taken so seriously at Westminster that a Joint Select Committee of the two Houses of Parliament had been appointed to enquire into what was called municipal trading. Municipal tramways formed one of the chief points of the enquiry. He was strongly in favour of enquiry whenever there was a case for it. The municipalities could only come out of the present enquiry with their hands strengthened. It was desirable that there should be the best possible understanding between Government departments and municipal corporations, and he was sure the association would be pleased to render any assistance or in any way make itself useful in that direction. If the association could, by encouraging mutual assistance and co-operation among its members, help to maintain municipal tramway undertakings at the highest point of efficiency in every respect; if they could continue to show how tramways could be operated so as to serve the greatest good of the community by transporting them cheaply, comfortably, and speedily from point to point within the area in which they lived and worked, the Government would be bound to recognise it sooner or later, and to encourage it in their own time and way. Districts could, however, be over-tramwayed, and tramways over-capitalised. He thought it was admitted that the first duty of municipalities operating tramways was not so much to show a large profit as to give the best and cheapest possible facilities of transit consistent with safe business and sound finance. If they erred, it must be on the safe side. It would be observed that the subjects to be brought before the conference were of general interest to all tramway men, and he hoped they would have a full and frank expression of opinion upon all of them from gentlemen who had given one or other of them their special attention and study. The first report was on the "Standardisation of Accounts," which subject he considered of primary importance. It was obviously by making friendly comparisons that they could be helpful to each other, and in a position to fulfil the objects of their association. But such comparisons were impossible at present, simply because no two statements of accounts were made up on the same basis. He therefore looked upon standardisation of municipal tramway accounts as the very foundation of their usefulness as an association. The President then called upon Mr. J. Dalrymple, C.A., accountant of Glasgow Corporation tramways, to submit his report on the "Standardisation of Tramway Accounts."

In submitting his report and suggested standard form of accounts, Mr. DALRYMPLE said it was important that they should, if possible, come to an agreement as to the various heads under which they should classify their expenditure,

Digitized by Google

because that side of tramway accounts was the more important. It would be seen that he had confined himself to the form of the annual financial statement, including revenue and expenditure account, capital account and balance-sheet, with an appendix giving a complete classification of construction and equipment accounts and operating expense accounts. He had endeavoured to draw out a form which could be adopted by all municipal tramway managers and borough accountants in stating their annual tramway accounts. He thought that tramway managers should be entrusted with power to have their expenditure classified in a particular way. In America they were very advanced in this respect, and had adopted a standard form of accounts very similar to that now proposed for acceptance in this country. In dealing with details, he had observed that some municipalities spent twice as much on repairing cars as Glasgow, while the latter town spent a great deal more on permanent way than any other city. There might be good reasons for these differences. It would be useful to know them. Referring to the suggested standard form, the permanent-way renewal fund—folio 4—was calculated on the basis of complete renewal at the end of the life of the track. As to depreciation, that should be charged first of all against revenue, and after that the sinking fund should be fully charged against net revenue, the result being that at the end of the borrowing period—31 or 40 years as the case might be—the Corporation would have their loan debt totally extinguished, and a complete tramway to hand over to their successors. That, however, was not a point which they could now discuss. On folio 7—capital account—the amounts deducted under each depreciation were shown. No notice was to be taken of the amounts given, as these were not intended for criticism, the main point being to agree upon a standard form of accounts. More or less detail might be given under the various headings. In that respect the form was not intended to be binding.

A vote of thanks was accorded to Mr. Dalrymple for his report, and the PRESIDENT, in opening the discussion on same, remarked that they were not there to discuss the question of depreciation and sinking fund, which was a matter of policy for corporations to deal with.

The discussion which ensued emphasised the desirability of adopting such a standard form of accounts as that suggested by Mr. Dalrymple. At the same time the difficulty of instituting a fair comparison between self-contained systems and systems depending upon an independent source for their power was pointed out. There was a consensus of opinion that all expenses rightly chargeable to power should be concentrated under one heading. Ultimately the following resolution was moved by the secretary of the association (Mr. J. M. M'Elroy, Manchester) and carried: "That the association is of the opinion that it is desirable that a standard form of tramway accounts should be adopted; that a communication be sent to the Burgh Treasurers' Association requesting them to appoint a number of their members to join with members of this association to form a joint committee to fully consider and recommend a standard system of tramway accounts suitable for adoption by the various municipalities; and that pending consideration of the matter each corporation represented be requested to consider the draft form of accounts submitted by Mr. Dalrymple, and to report."

Messrs. John Young, R. C. Bellamy, J. Dalrymple, G. Swainson, and J. M. M'Elroy, were appointed to represent the association on the joint committee.

Next in order came a report by Mr. A. Baker, chief officer, London County Council tramways, on the "Hours of Labour and Rates of Pay obtaining in Various Municipal Undertakings in Great Britain." In this report the author gave some interesting figures and information relating to the conditions under which tramway men are employed in different towns. In 1897 the tramway undertakings in the United Kingdom numbered 159, of which 42 only belonged to local authorities, while by June, 1902, no less than 74 new undertakings had come into existence, the total number then being 233, of which more than half—viz., 118—belonged to local authorities. The figures given in the report related to 34 different towns in Great Britain. An examination of the figures, the author pointed out, did not disclose any very considerable difference in the rates paid to the various classes of employés in different towns. It would be seen that, with only one or two exceptions, every town had adopted a graduated scale of pay for drivers and conductors, new men starting at the lowest rate and rising to the maximum by length of service varying from six months to three years. He (the author) had more than once heard this system bitterly attacked, it being argued that one man might become as proficient as another after about a month's service. Those who were engaged in the actual operation of tramways were fully aware of the fallacy of that argument. They knew that the percentage of accidents of one kind or another with which they had constantly to deal was considerably higher where new men were concerned than where the men had been in the service, say, two years and upwards. That fact alone was, he thought, sufficient justification for the method almost universally adopted. He found, taking the maximum rate of pay in all cases for motormen and conductors, that the average over the whole country was as follows: motormen, 6¼d. per hour; conductors, 5¼d. per hour. That worked out, taking 60 hours a week as the standard, at 31s. 3d. for motormen and 26s. 3d. for conductors. It was to be observed that out of 33 towns only two—viz., London and Glasgow—paid motormen and conductors equal wages. In the remaining 31 towns motormen were paid at higher rates than conductors. For his own part he could not see any legitimate reason why the driver of an electric car should receive more pay than the conductor who was in charge of everything except the driving, unless it were in some rural district, with a sparse population and light traffic, where boys or youths might well be employed. Placing the towns in order according to the wages paid, he found that the London County Council paid their motormen 7½d. per hour—thus heading the list—while three towns paid 7d., three 6¾d., seven 6½d., three 6¼d., ten 6d., and the others slightly less per hour. With regard to conductors, the towns came out in slightly different order, although the London County Council still headed the list with 7½d. per hour, while of the other authorities two paid 6¾d., four 5¾d., eight 5½d, two 5¼d., and ten 5d. per hour. He had often heard it argued that there should be a standard rate of pay for tramway employés all over the country, those who supported the arguments asserting that the work of "lifting" pence from passengers or manipulating the controller or brake handles was equally arduous whether in London, Glasgow, or the urban district of X For his own part, he had never been able to see any force in the argument that because A and B paid its men so much per day or week C must do likewise. Of course, there were some towns of about equal size and alike in some other respects where the wages paid in one might well serve as a guide to the other, but, generally speaking, each corporation must fix rates according to local conditions, and regardless of what is being done in other places. The advocates of a standard rate of pay were in this dilemma: they must either fix the standard equal to the highest rate in the country—which would be a very nice thing for tramway men in rural districts—or they must strike an average. The average for motormen was 31s. 3d. per week. If, therefore, that was to be taken as the standard, motormen in London would have to submit to a reduction of 6s. 3d. per week. That, he ventured to think, exposed the ridiculous nature of the argument. With regard to hours of labour, the position was different. It was a much easier thing to establish a standard day's work for the outside staff than to standardise the pay, and in that respect he thought it was remarkable how generally the 10 hours' day, six days a week, admitting the blessed principle of one day's rest in seven, had been adopted in this country. Glasgow, Doncaster, Cardiff, Plymouth, Halifax, and Manchester had adopted a nine hours' day, 54 per week; Warrington and Darwen following next with 56 and 57 hours per week respectively, while all the remainder, with the exception of three, had set up the 60 hours' standard. With regard to the three towns where a 60 hours' week was exceeded, it was only fair to say that considerable reductions in the hours of labour had been made as compared with the companies who worked the

Digitized by Google

undertakings previous to the corporations obtaining possession. In one case the men worked under the company as much as 91 hours a week; this had been reduced to 65. In another, 95 hours a week were worked; this was reduced to 63; while in the third case, 81 hours had been reduced to 64½. Notwithstanding the variations referred to, it might be taken that a 60 hours' week was the standard, and, considering the nature of the work, he was not one of those who considered 60 hours a week on a tramcar outrageously long. During the last five years, under municipal control, and largely by the aid of electric traction, tramway men's hours had been reduced by 48 per cent., and at the same time their wages increased by not less than 42 per cent. In London it had cost the Council upwards of £40,000 a year to give its servants a 60 hours' week and a decent living wage. The opponents of municipal tramways treated this extra expense, as compared with company management, as loss in working, and gravely stated that corporations could not manage their concerns as economically as those controlled by private enterprise. He believed no gentleman present was anxious to emulate private enterprise in effecting economies at the expense of human beings by sweating them in the same way they were sweated a few years ago. Many of the corporation tramways, however, were experiencing the first flush of success, and while it was the obvious duty of the municipalities to put labour on a proper basis, yet the meting out of any preferential treatment to tramway servants should be strictly guarded against. Having regard to the peculiar nature of the work tramway men should be generously treated, but there were limits, and as soon as those limits were passed so soon would the work in which they were all engaged be seriously prejudiced. A danger to municipal tramways lurked in attempts which had been made in some towns, immediately the municipality had acquired the tramway undertaking, to place the employés under conditions altogether out of proportion to the duties performed. Such attempts, which were fortunately rare, simply armed those who were bitterly opposed to what was called municipal trading with a weapon which was unhesitatingly used against every corporation, quite regardless of whether the undertakings in which it was engaged were conducted on sound business principles or not. The remainder of Mr. Baker's report was devoted chiefly to the question of encouraging friendly societies for the benefit of the men. The author instanced the societies connected with the tramways in Liverpool and Glasgow as being especially worthy of imitation.

An adjournment was then made for lunch.

In the course of the discussion on Mr. Baker's report, which ensued after lunch, the question of Sunday labour claimed principal attention. It appeared that no difficulty had been experienced or objections raised in the towns where the men are allowed to work only six days per week, and take their share of Sunday work in rotation without extra pay. The policy of giving the men additional remuneration for Sunday labour was generally disapproved. Several speakers also emphasised the responsibility of the motormen as compared with that of the conductors, and sought to justify the prevailing higher rate of pay in favour of the former by that line of argument, thereby disagreeing with Mr. Baker's contention that the rate of pay for motormen and conductors should be equal.

Mr. Baker having made a brief reply to the discussion,

A voluminous and highly instructive "Report on Permanent-Way Construction and Maintenance" was submitted by the president, Mr. John Young. Being in the form of a tabular statement, the interest in the report was great enhanced by an admirable summary prepared by Mr. C. A. King, permanent-way engineer, Glasgow Corporation tramways, and read by that gentleman. Pressure on our space prevents us from dealing with the report now, but we hope to do so in a subsequent issue.

The discussion on the report terminated the first day's business.

In the evening the members of the association were entertained at dinner by the Lord Provost, convener, and members of the Tramways Committee of the Corporation of Glasgow in the banquetting hall of the City Chambers. Thus ended a full and instructive day's proceedings.

MUNICIPAL ELECTRICAL ASSOCIATION.

The eighth annual convention of the above association was opened in Sunderland on Tuesday last. The MAYOR (Councillor H. J. Turnbull, J.P.), having been introduced by Mr. Snell, extended a cordial welcome to the members and their guests. He hoped that the meeting would be intellectually profitable to the members. Owing to there being few skilled electrical engineers on councils, the corporations had to depend for the success of their electrical undertakings on their engineers. He was sure that these engineers would derive great assistance from the association. In Sunderland they had spent half a million of money on their electric lighting, tramways, and power scheme, under the able management of the association's president, Mr. J. F. C. Snell. He could assure those present that in Sunderland they highly appreciated the honour done to Mr. Snell in electing him as president.

Mr. J. F. C. SNELL, after thanking the Mayor for his kind words of welcome, proceeded to read the following address:

Presidential Address.

BY MR. JOHN F. C. SNELL, PRESIDENT.

GENTLEMEN,—I feel very deeply the honour which you have done me and this town in conferring upon me the office of president. In these days so many presidential addresses are written that it is difficult to select a wise and useful subject, and particularly so when the utterance of the president to some extent involves the association he represents; though, of course, members cannot be really held responsible for the president's vagaries. As the opportunity comes but once, I have determined to speak boldly on some of the subjects which I feel are seriously menacing the progress of municipal undertakings. On more than one occasion I have been told that our association is feeble in its organisation, and has done little of importance during its existence. To such criticism I have retorted that if nothing further had resulted, the fact that the municipal engineers and chairmen of committees of most of the principal towns in the United Kingdom are annually brought into close communication, and are thus enabled to have an interchange of opinion, this alone has proved the association to be of the utmost value to its members. It has given an impetus to municipal electrical industry, and through this co-operation of its members has not improbably saved many towns unnecessary expenditure. For my own part I must freely admit that I have received much help from these annual conventions, not only from the papers, but particularly from private discussions and visits to various works throughout the country. The *esprit de corps* and good feeling which is so noticeable at these conventions is a particularly pleasant phase of our association. I believe that there is much work for which this body may prove to be a useful instrument. The municipalisation of certain public necessaries—whatever may be the opposition offered by private interests—has become a settled policy of the present day. Among these is the supply of electricity, and it must be acknowledged that municipal electrical supply must be allowed free and wide expansion, and that unnecessary restrictions must be removed.

Let us consider for a moment the wider question of the general spread of electrical applications. The natural law of the survival of the fittest is at work in every department of life. We shall agree, I think, that of all known means of transmitting energy electricity has the right, *par excellence*, to the fittest position, and its wider use will help us to use the natural wealth of our land with increasing efficiency. The coal stores of Great Britain are not inexhaustible. If the antiquated steam-engines, useless shafting, and indirect means of applying power were done away with, and in place of them works of every class were electrically driven, the annual consumption of coal would be enormously reduced. It is to me a melancholy reflection that the accumulated energy of past ages should be so prodigally wasted, and wasted beyond recall, through this delay in adopting the most economical and efficient means of its transformation for our manufacturing requirements. When conveyed to countries where these natural riches do not exist, and where, therefore, manufacturers cannot afford to be so wanton, competition has demanded an increased efficiency in workshop methods, which we ourselves, I regret to say, have been too slow and conservative in following. I believe, however, that at last English people have awakened from their lethargy, and it may be a surprise to many to see the evidence of rapid electrical developments on the Wear, Tyne, and Tees; and more surprising still when they are told that this has all sprung into being during the last two or three years. The effect upon trade output, I am convinced, will soon be noticed, and this will mean a new era of prosperity to our manufacturers.

Digitized by Google

But it is more particularly on the supply of electricity by municipalities that I wish to speak. During the last year there has been an outburst from a section of the community against municipalisation, and there can be no question that Parliament apparently intends to restrict us to narrower bounds. I am not going to enter into the field of politics, with which neither I, nor we, have anything to do. We are the public servants of municipalities, and our duty is clearly to do our best in that service; but I want to take this opportunity of putting before you seriously some of the disabilities with which we are fettered. To remove a false idea which has been circulated—viz., that electrical supply companies are much more progressive and are managed in a more businesslike way than municipal departments—let me briefly recite what was the actual comparison for 1902 between these two classes of undertakings. The total capital outlay on company undertakings in the Metropolis in 1902 was £9,299,000, and on undertakings owned by local authorities £1,448,000. The average capital expenditure per kilowatt installed in the former was £115, and in the latter £96·5. The average price per unit sold in the former was 4·72d., and in the latter 3·58d.; whereas the cost per unit sold was 2·59d. in the former, and 2·38d. in the latter—which means that metropolitan companies spend 19 per cent. more on plant, charged 32 per cent. more for each unit sold, and their costs were nearly 9 per cent. more than the local authorities. And the same is true of the provincial undertakings. In the provinces the companies had spent £2,963,000, and the local authorities £13,404,570. The average capital expenditure per kilowatt installed in the former was £98·5, and in the latter £78·5; and the average price per unit sold in the former was 4·45d., and in the latter 3·15d. The companies spent 25 per cent. more on plant, charged 41 per cent. more per unit, and their costs were nearly 34 per cent. in excess of the costs of the municipal undertakings. This, surely, sufficiently answers the attacks which have been made upon municipal electrical undertakings during the last year.

The most important and most debated question at the present moment is that of depreciation of municipal electrical undertakings. There is a class of critics which affirms that municipalities are not working on a financially sound basis because the majority of them do not form any depreciation fund, or at least have not yet commenced to form one. These critics state that in order to be sound we ought to pay off our capital by sinking fund as at present, and in addition, to form a sufficient and separate depreciation fund. In 1901 this association, in conjunction with the Borough Treasurers' Association, passed resolutions which affirmed that when the term of repayment does not exceed 30 years, and provided the plant be kept up to its proper capacity from revenue, a further depreciation fund is unnecessary and uncalled for. A great deal of this controversy about depreciation arises from the wilful neglect of our critics to make a *just* comparison between companies and municipalities, and also I think by a confusion between "wear and tear" and "antiquation." I think it better to at once make this point clear. For example: a boiler will require certain repairs from year to year; new tubes, new parts of certain fittings, new furnace tubes, perhaps, or other renewals dependent on the type. This I call "wear and tear," and such renewals are properly paid for from revenue. But in addition there is a gradual deterioration of the boiler itself right through—a process of decay, as it were—and, like ourselves, it has a life dependent on two things: its original manufacture and its usage during life! This deterioration I call "antiquation," or true depreciation. There is yet a third factor not to be forgotten, but I think easily disposed of—viz., the possibility of certain details of plant becoming obsolete. I do not call the replacement of small sets—rendered necessary during the pioneering stages of any concern—by larger and more economical sets "obsolescence," for the smaller sets will fetch their present value when sold, and thus no waste of capital takes place—at least this is my personal experience, from which I generalise. Nor do I consider such a case as the supercession of the 100-volt lamp by the 200-volt such a case, for the earning capacity of cables was thereby much increased, and the cost of the change was charged to revenue in most cases. Newer methods of distribution, or improvements in gas-engines, for example, might introduce economies which would make present-day plant comparatively inefficient. But one might speculate on possible improvements and frighten oneself into a state of imbecile passivity, so I really do not think that this factor is one to be seriously taken into account. We were left then with two other factors—viz., "wear and tear" and "antiquation" (or true depreciation). The first is met by revenue, and is thus safely dismissed from this argument; but antiquation remains. We must look squarely at this fact. Some of the plant in both electricity and tramway concerns has a shorter life than the 25 or 30 years allowed by the Local Government Board—some a much longer. The period for the repayment of these loans is one which requires alteration. I will first recite some of the anomalies which exist. The London County Council is enabled to grant periods of 42 years to the borough councils. The Commissioners for Scotland allow a period of 30 years for municipal undertakings within their province. There are isolated cases of even longer periods—such as Glasgow, where an old Act gives that city 62 years in which to repay its debt—while we in provincial England are allowed by the Local Government Board a period of only 25 years. If application be made to Parliament by way of Bill for extensions of electrical works, the undertakers are granted 25 years only, it is true, but are given a remission of the sinking fund instalments for one, two, or three years, a point which was strongly sympathised with by the Committee on Repayment of Loans in 1902. The Local Government Board, however, is unable to do this, and thus those who proceed by the less costly method of provisional order have to pay this sinking fund on all extensions and new loans before it is possible for the new capital to have earned any revenue. Another case: if a council apply to Parliament for a Bill to construct and work its tramways and to build the necessary power-house, a period of 30 years is granted for the repayment of the whole loan (in some cases, of course, longer periods being given for land, and the usual period of five years for the costs of the Act); but if the same corporation provide [the necessary power-house through *an extension of its electric lighting undertaking and instal identically the same plant as in the former instance*, the loan must be repaid in 25 years. If plant which runs at 17 hours a day, and subject to the severe conditions of tramways supply, can be given the longer period, why should not electrical undertakings be given at least the same extended period, especially when the plant is subjected to less severe conditions; and if 42 years is the legitimate period for repayment of loans in London, why should provincial undertakings be called upon to repay theirs in 25 years? Everyone points to the general excellence of management in the second city of the Empire. If 62 years is proved to be a legitimate and not unduly long time there, why cannot the rest of us be given similar privileges? A curious anomaly to me is that electric lighting undertakings are only allowed 25 and the tramway undertakings 30 years, when I am of opinion that the reversal of these periods would bear a more real proportion to the lives of the undertakings.

Now, the point which I wish to emphasise is this: the financial regulations of the Local Government Board, to which we are subjected, require a very drastic alteration. Some of our plant (such as accumulators) has a natural life of only 10 or 11 years, some 25 to 30 years, and some 50, 80, or 100 years. A sinking fund which repays a debt in 25 years is a clumsy and unsound instrument for writing off plant which is non-existent in the eleventh year under existing conditions, although the 25 years is supposed to represent the "equated" life of the whole of the installation. The present method of the Board in such a case is to grant a further loan for the replacement of this portion of the plant, for which they grant a period of 10 years. The result is that from the eleventh to the twenty-first year a two-fold sinking fund on this particular plant has to be paid, and then in the twenty-first year the plant again is non-existent, and a third loan has to be applied for. This, of course, is nonsensical. That is one extreme view of the question. On the other hand, buildings, stoneware casings, cast-iron pipes, roadwork for mains, and land will have depreciated but very slightly in 25 years, and if Parliament has safely been able to grant 60 years to gas and water undertakings for their pipe lines, reservoirs, etc.—subjected as they are to much more serious depreciating action than those I have enumerated—I say that we have every right to take this extended period as the natural life of *those portions* of our undertakings. I do not want to argue from false premises, as a critic might say that one has no right to assume that the 60 years for gas and water undertakings *is* a legitimate period; but basing one's estimate of the life of these items from other engineering sources within one's experience, I cannot come (nor I am sure can anyone else) to any other conclusion. Under the Public Health Act, 60 years is the maximum period allowable. In 1901 a table was laid before the association by Mr. Newington, of Edinburgh, in which the life of all the details of a representative electrical undertaking was set forth, and this received the unanimous support of the council. That table made out that at any rate the equated life was well over 30 years. I have most carefully applied the like reasoning to several undertakings in very great detail (including that of which I am the chief officer) and I cannot make the figure less than 42·8 years. I presume that the shareholders of electrical companies will expect to get this life from their own undertakings—in fact, there are companies which have been in existence for very nearly half this period already, and show very little signs of collapse; on the contrary, they become more remunerative each succeeding year. Clause 52 of the model provisional order sets forth that undertakers may set aside annually from their profits a reserve fund up to a limit of 10 per cent. of the aggregate capital expenditure, and also that when the surplus in any year exceeds 5 per cent. it shall be compulsory upon the undertakers to make a reduction to their customers. I suggest that a better system of finance would result from the following amended regulations:

All municipal electrical undertakings should be granted a

Digitized by Google

period of 42 years for the repayment of loans. Each application for a loan should be subjected to an enquiry of the Board of Trade so as to ensure that respectable schemes only were submitted, and it should be compulsory upon the municipal authority to set aside an additional sum (over and above the sinking fund thereby entailed) of 1½ per cent. of the value of the capital expenditure commencing not later than two years after such expenditure had been made, to form a depreciation fund. If the gross profits of the undertaking were unable to meet this liability, then the deficiency to be met from the local rate as at present, or if the deficiency continue for more than a given period, the charges for energy supplied to be raised so as to meet the deficiency. Now, the capital charges on an undertaking taken at 42 years and with 3½ per cent. interest will amount to £4. 17s. 6d. per cent., and upon the same basis for 25 years amounts to £6. 8s. 7d. per cent., showing a saving of £1. 11s. 1d. per centum per annum, against which has to be set the 1½ per centum for the depreciation fund. As an example, take the expenditure on the electrical undertaking of this town. Our capital expenditure to date is £224,000, and our average capital expenditure for the last 12 months was £211,600. The accumulated sinking fund paid out of gross profit is £20,073, which amounts to practically 10 per cent. of the average capital outlay. We have no depreciation fund in addition to this amount, although we have a small reserve fund, and intend, of course, to add to this fund when we can. If the conditions which I suggest had existed from the first we should have had about £10,500 in the sinking fund and £9,600 in the depreciation fund, representing 4½ per cent. on the average capital outlay. I assert that this would have been a sounder financial position than the present. A sinking fund is an absolutely inflexible sum which cannot be appropriated for any other purpose, of course, than the cancellation of the original debt, but electrical undertakings require something over and above this—a fund from which sums can be taken from time to time to make good any shorter-lived and worn-out plant.

It has always been argued that the 21 years' life which was given to company undertakings by the Act of 1882 (after which period municipalities could buy an undertaking at its then value), was an insufficient period for the use of the shareholders' money, and that the proper thing was done when Parliament (Section 2, Electric Lighting Act, 1888) increased this period to 42 years. What, then, do we find these companies doing, controlled as they are by most able financial and engineering exports? They are content to form a depreciation and reserve fund which amounts to something like, and, so far as I am aware, often much less than, 10 per cent. of the capital outlay. Presumably, therefore, this must be considered a sound position, otherwise companies could never have the stability which they enjoy. As this is true of company undertakings, what logic or reason is there in refusing to give municipalities precisely the same privileges, or why should municipalities pay more than companies? Both will have enjoyed 42 years' use of the original capital, and will be, as a result of their trading, able to re-enter on their obligations to their consumers. It has been argued and reiterated that the action of our Legislature in the eighties was the primary cause of our backwardness in electrical developments when compared with America and foreign countries. Parliament having granted municipalities the power of creating and working their own electricity supply works, cannot now cancel those powers, the matter having gone too far. Is the Legislature, therefore, going again to be the means of restricting electrical developments in England by putting unduly onerous charges upon those undertakings under municipal control? It is in the developing days of all commercial enterprises that the severest struggle is felt. There is a big and growing demand in England to-day for electrical power. England is suffering in its competition with other countries, *inter alia*, for want of this more efficient agent. In the majority of cases the municipality is the authority which has been granted the statutory powers to provide this want, and I emphatically state that the onerous regulations imposed upon us for the too rapid repayment of our capital is preventing us from developing as rapidly as we ought to do, by its necessary reactance on the charges to consumers, and is injuriously affecting our manufactures.

I hope I have clearly shown that there is need, and urgent need, for concerted action to obtain a revision and simplification of these regulations. I want to see municipalities placed on a par with admittedly well-regulated companies, and I believe that the extended period of repayment, the compulsory formation of a depreciation fund in addition to this extended sinking fund, and an enquiry upon each loan by a properly constituted section of the Board of Trade composed of a few electrical experts, would prove a panacea for the present evils. It would have the effect further of bringing all the present anomalies into alignment, and it would enable municipally-controlled undertakings to be governed on thoroughly sound financial lines. The present Government has just authorised the formation of a Royal Commission to enquire into the whole question of municipal trading. I do earnestly hope, for the good of municipal electricity, and for the whole electrical industry at large, that vigorous action will be taken by the Association of Municipal Corporations, and by ourselves, backed up, I hope, by the loyal co-operation of the Institution of Electrical Engineers and by the electrical Press, to attain this end. This may be Utopian, but I have faith in the common-sense and justice of these bodies, and I believe that this item—which I consider to be the most important on our costs sheet to-day—can be thus more fairly apportioned among the present and succeeding generations.

Another point on which I wish to speak is the tendency of many municipalities to allow tried and capable officials to leave their service at a critical time in the development of their systems. On this point I feel perfectly free to speak without the risk of being misunderstood, because of my known relations to the Sunderland Council. I think it wise that a municipality should engage an independent expert engineer to launch the undertaking, and to assist in the selection of a capable chief officer. This officer being appointed will then seriously consider local conditions, and if he is worth anything at all will devote his energy to the proper and careful development of the work entrusted to him. But being young and ambitious he will be naturally allured to another town offering a wider field and a bigger salary, and I have known men who have been allowed to leave because their councils have been niggardly, and have declined to increase salaries which were entirely disproportionate to their serious responsibilities. One does not hear of the like changes on the staffs of the larger companies. A change of management in such a case must affect, temporarily, the progress and development of the system, for it takes time for a new man, however capable, to acquire a thorough knowledge of local conditions, and even a slight change of policy may cost the municipality a great deal of money. Councils, I think, want to form an idea of the depreciation of the engineers, the wear and tear on whom is a really serious factor, for the responsibility of electrical supply undertakings is a very heavy strain. I think more encouragement is required to be given to officials of proved efficiency.

One other word which, at the risk of being considered priggish, I would address to my brother engineers. There is a tendency to attempt to make engineers, who are responsible for the selection of contracts, stray from their strict sense of duty by offering, directly or indirectly, some inducement to them to become biassed in favour of some particular plant. We have maintained an excellent record for purity of conduct, and the result is that, young men as we all are, we have earned the respect and confidence of our councils, which it must be our endeavour to retain. I do not wish to preach a sermon, but there are so many young engineers starting in public life—and there is no question that the temptation does exist—that I hope the same character for commercial purity and for strict professional etiquette will always be a significant factor in our careers.

There are many questions which must give rise to anxious thought. The progress of gas-engines and the production of high calorific gas, the improvement of the steam-turbine, the probable economies in methods of electrical illumination, the increasingly greater scope of electrical applications, all present material for judgment in forecasting their influence upon future extensions. However, a modern electrical station is so highly efficient that there does not seem to be much probability of such improvements in either generation or distribution as will make it worth while to scrap modern installations. If machinery which was installed 14 or 15 years ago is able to-day to keep up with present-day requirements, how much truer this must be of plant which is being put down at the present time. I think, therefore, after making due allowance for the possibilities of improved prime movers and other things, we must not let this unduly interfere with our judgment and enterprise. One wishes that more progress could be made with electrical storage, as an efficient battery would very materially alter the problem of electrical supply. We shall have during the convention some excellent papers dealing with both the commercial and the technical aspects of our service, and it is gratifying to know that the distinguished chairmen of committees who have written them are among those who are so widely known for their experience in municipal government. The technical papers also contain materials for most profitable discussions.

I sincerely hope that the Sunderland and District Convention will be a means of widening our knowledge, and, together with the hospitality and assistance which I know is to be given to the association by the corporations whose towns we shall visit, will be productive of much real good.

Alderman NORMAN, of Cheltenham, proposed that a vote of thanks be given to Mr. Snell for his most able and instructive address. He agreed with it, and especially with that part which dealt with the remuneration of electrical engineers. He held that the chairman of an electricity

Digitized by Google

committee should see that his engineer was rewarded for work done, and that if the council would not make reasonable provision for the same, he suggested that the chairman should resign when the electrical engineer was induced to leave for a more remunerative position elsewhere.

Bailie MACLAY, of Glasgow, seconded the vote of thanks, which was carried with acclamation.

Mr. SNELL then called upon Alderman J. P. Smith, J.P., to read the following paper:

Some Statistics of Electricity Supply.

BY ALDERMAN J. P. SMITH, J.P., MEMBER OF COUNCIL, EX-MAYOR AND CHAIRMAN OF THE ELECTRICITY COMMITTEE, BARROW-IN-FURNESS.

In laying before the members of this association the following paper, the writer has done so for the purpose of enabling them to take a general survey of the present position of electricity supply as viewed from a commercial standpoint, and the progress which has been made in the industry during the last seven or eight years. It is to be hoped that some committee members will take part in the discussion on this paper, the subject of which should interest especially all chairmen of committees, for it must not be forgotten that when the balance-sheet at the year end is not satisfactory, it is those gentlemen who have to explain it to their colleagues and defend their engineer and station as best they can. The difficulty and danger of dealing with figures has not been overlooked, nor the fact that with a little careful selection and manipulation they can be made to prove almost anything, but in this case the figures have not been *selected* to try and prove any theories previously held, but rather the whole of the available returns are presented for examination to see whether any instructive lesson can be deduced therefrom.

TABLE I.

SUMMARY OF ELECTRICITY UNDERTAKINGS.

It will be seen from the *Electrical Times* quarterly returns, that the number of municipal stations in operation is practically double of the companies, while of the works under construction the proportion is nearly 3 to 1, and of the orders still to be put into operation, almost the whole are in the hands of the municipalities, many of whom, however, it is to be feared are only using them for a purpose for which they were never intended—viz., to keep out a private company. This is a practice very much to be condemned, and it seems a pity that the Local Government Board have not seen their way to try and stop it. In the earlier days of the industry, most of the pioneer work was done by companies, to whom great credit is due, but the majority of municipalities soon saw the advantages to be derived from having the control of such an important and profitable undertaking in their own hands, and it is an interesting and notable fact that 15 towns and cities who allowed private enterprise to step in and take up this work at the commencement have since seen the folly of that course, and have bought them out (often at a very big price). In no case has a municipal supply when once started been transferred to a company. According to this table, taken from *Garcke's Manual*, both classes of stations are going ahead very nicely, but the local authorities, which for the first four years given were far behind the companies, have now made up all arrears and are well ahead, especially in the matter of output, which has grown enormously of late—probably due in no little degree to supply for motive power and traction.

TABLE OF CAPITAL OUTLAY PER KILOWATT.

The great importance of the question of capital expenditure, and the heavy burden in the shape of interest and sinking fund which unfortunately accompanies it, and which tells so very severely in our profit and loss accounts, justifies us in examining very carefully into this matter with a view to seeing whether there is any likelihood of an improvement in the future.

Table IIIa (*Corporations v. Companies*) deals with the question as between municipal stations and those owned by companies, and it is very gratifying to notice that, whatever the system in vogue, the municipalities show much the better results. Thus, in the case of alternating plant it is only £92 per kilowatt, as against £106, whilst a comparison of continuous-current stations shows an outlay of £89 against £129; or by grouping the whole of the stations together, the cost to municipalities is £90, and of companies £117. These figures cover a period of eight years, totalling altogether 829 returns, and in the case of the last year extend over no less than 182 separate stations, and may, therefore, be taken as a pretty reliable estimate of the cost per kilowatt installed. It is to be hoped that they will satisfy the most rabid anti-municipalist that in electricity supply stations at least local authorities obtain good value for the money spent. There is one feature about these returns which is not very encouraging—viz., that the very heavy expenditure for every kilowatt installed does not show any signs of reduction as time goes on. The figures fluctuate a little from year to year, but do not show any definite signs of either improvement or the reverse.

Table IIIb (*Continuous v. Alternating*) deals with the same question, but is arranged rather differently to show a comparison as between alternating and continuous current systems. It will be seen that in the case of corporations the balance is slightly in favour of continuous, whilst in the case of companies it is very strongly the other way, and taking the whole of the returns together, the alternating system comes out slightly the cheaper.

TABLES OF COST OF PRODUCTION.

These tables are arranged in the same way as the preceding ones, but show the cost of production, and on the whole are more encouraging. For the first three or four years the reduction of costs was fairly rapid, but during the last two or three years has remained almost at a standstill. It must be remembered, however, that the lower the costs of production are reduced, the greater become the difficulties of still further improvements; and another factor in the case is the abnormal rise in the cost of coal in 1900 and 1901. The figures for 1901 show a decided gain on 1900 in all classes of stations, and when the returns of 1902 are available, it is confidently expected that a still further improvement will be recorded.

Table IVa.—Corporations v. Companies.—With the exception of the first year, municipal stations show much lower costs all round than those of companies, the average of all the returns available being 2·75, as against 3·3, a notable saving of over ½d. per unit.

Table IVb.—Alternating v. Continuous.—Alternating plants run by local authorities show an increased cost of production over continuous in the proportion of 3·1d. to 2·4d., a difference of ·7d. per unit in favour of continuous. In the case of company stations, both systems show the same results. By grouping all the returns together, a balance of ·35d. per unit in favour of continuous is observed. In comparing the two systems, however, we must not forget that the districts which were most favourable to electricity supply were those where continuous-current stations were first erected, and it was not until the alternating system was introduced that the more sparsely populated towns were taken in hand. It must be mentioned, however, that in both these tables all figures for

Digitized by Google

repairs in any first year have been ignored for obvious reasons. With a view to seeing how far it is possible that the costs of production might be reduced in the near future, without assuming any radical change in the present methods of generation, two imaginary costs sheets have been prepared. The first one (IVc.) is obtained by taking the absolute lowest figures for each item, as shown in the *Lightning* Analysis, and combining same. The result is a total cost of ·78d. per unit. The item of ·02 sinking fund for Stepney is, however, quite out of the ordinary, and is bound to be misleading, but if we substitute the next lowest, Shoreditch, which is ·19d., then the total would be ·95d. The second table (IVd.) is one which is more likely to obtain in practice, and is made up by taking the average of the 10 lowest costs in each item, and this gives a total of 1·41d. In connection with the cost of production, it will be generally conceded that there are very many factors which have an important bearing on this, but the three which are usually considered to have the greatest influence on costs are output, load factor, and cost of fuel. In order to see how this works out in actual practice, four tables have been compiled. The first one consists of the 40 stations having the largest output (all but two having an output of 1,000,000 and over). The second table gives the 40 stations with the highest load factor (the highest being 29·4 per cent., and the lowest 14 per cent.). The third table shows the 40 stations with the lowest costs per unit for fuel (the figures varying from ·16d. to ·60d.); and the fourth gives the 40 stations with the lowest total costs (the extremes being ·96d. and 1·75d.). Referring first of all to the influence of *output* on costs, we find that out of the 40 stations with the highest output, only 24 appear in the list of the 40 lowest costs. Turning next to the influence of *load factor*, it is seen that there are only 23 appearing in the table giving the best results; and, finally, the importance of low fuel costs is shown by the fact that out of the 40 best returns, 29 appear in the list of lowest total costs. All these figures tend to show that no *single* favourable factor is in itself sufficient to command success, and that no station engineer need be discouraged because the works under his control are only of moderate size. The figures given in this table are only for what is termed private supply, and do not include current supplied either for public lighting or traction purposes.

sumer, and it is gratifying to find from Table V. that there is a steady reduction year by year in the price charged. During the six years dealt with the companies have reduced their average charge from 6·01d. to 4·96d., a difference of 1·05d. per unit, whilst the corporations, although starting from the lower level of 5·38d., have been able to reduce their charges by a still greater amount of 1·11d., bringing down the price to 4·27d. It will be observed that, taking the last year's returns available—viz., 1901—that no less than 50 per cent. of the companies are obtaining 5d. per unit and over for their current, whilst in the case of corporations only 19½ per cent. obtain such a large rate of revenue. This is an important point to notice, as municipalities are often twitted with showing a very poor return on the capital expended. They can at least point to the fact that they are supplying their consumers at a much lower rate than is the case with private companies. Had the municipal stations charged the same rate as the companies they would have enjoyed an increased revenue during 1901 of no less than £444,519, equal to 2·62 per cent. on the capital invested.

Interest and Sinking Fund.

Many are the troubles and worries which beset the electrical engineer in his efforts to give a continuous and steady supply, and numerous are the difficulties which bar the way to such a substantial reduction of price as will enable him to realise the forecast of Sir William Preece and make electricity the poor man's light. Discussions innumerable have taken place as to what is the real cure to be sought for, and free lamps, free wiring, prepayment meters, utilisation of water power, maximum demand meters, hiring out of motors, etc., all have their advocates. But in the opinion of the writer the biggest bugbear in the whole business is the abnormally heavy payments for interest and sinking fund; and if the heart of a chairman of committee is not too hard to receive any impression at all, surely these three fatal words would be revealed by a post-mortem examination. How often do we scan the records in the weekly analysis and read something of this sort?

	Revenue.	Expenses.	Gross profit.	Int. and S.F.	Net profit
No. 1 ...	£60,000	... £35,000	... £25,000	... £24,500	... £500
No. 2 ...	86,000	... 35,000	... 52,000	... 42,000	... 10,000
No. 3 ...	168,000	... 83,000	... 85,000	... 66,000	... 20,000
No. 4 ...	24,000	... 14,000	... 10,000	... 12,500	... -2,500

It is not the amount of these sums which appals one, but the relation which they bear to the total costs. Take the case numbered 2, the figures are not absolute, but quite near enough for our purpose. Here we find a well-managed station where the costs bear a very favourable comparison with the receipts, and yet out of the very handsome apparent surplus there has to be taken a further sum for interest and sinking fund, actually more than the whole of the rest of the costs put together. This may seem an extreme case, but an examination of a series of very lengthy tables which the writer has prepared show that in this particular town the cost of sinking fund per unit sold is rather under than over the average. The rate of interest at which our municipal authorities borrow money is so nearly alike in different towns that the writer did not think it worth while to go into this question in detail. Table VIII., however, gives the average for each year.

The question of sinking fund is, however, much more intricate, and the practice varies very much. As is well known, the London boroughs obtain money through the London County Council on a 42 years' repayment system, whilst most other boroughs are only allowed 25 years by the Local Government Board. In some towns powers have been taken under various old local Acts—in many cases for very long periods. In Glasgow, for example, under the old borrowing powers (which are now, the author believes, exhausted) the repayment spreads out up to 62 years. Tables have therefore been prepared showing both the cost per unit sold, and also the percentage to average capital invested; and to still further probe this question, these have been arranged in two ways—first, giving the results for each year from 1894 to 1901 inclusive, and, second, giving the figures according to the year of working from first to eighth.

Table VIa.—As far as percentage to capital is concerned, it is bound, more or less, to follow the question of capital expenditure, and yet it is satisfactory to notice that the percentage fell from 3·22 in 1894 to 2·44 in 1899. Since then, however, it shows a slight rise. In connection with this, it may be interesting to note that while in the case of municipalities the charges for sinking fund in 1901 amounted to 2·57 per cent., and in the case of companies for the same year it works out to only 1·09 per cent., 10 out of 51 companies making *no* allowance whatever under this head.

Table VIb.—The cost per unit sold, however, does show some improvement, and this may be expected to still further improve as the load factor continues to rise. It should perhaps be stated that these tables are compiled almost entirely from the well-known *Lightning* analysis, and in some few cases the amount set down as sinking fund also includes sums set aside as depreciation, renewals, etc., in addition to the sinking fund, as required under statutory obligations. The full tables are unfortunately much too bulky for the *Proceedings*, but a summary of each is given. The individual figures vary very much, and excluding first years, which are often quite fictitious, the highest cost per unit is a medium-sized manufacturing town, where for the second year the figure is no less than 4·09d. per unit, and even in the third year is practically 3·0d. (2·99d.). In another case, and this one of our large cities, the charge under this head is 1·6d. on the seventh year's working. Another town of medium size is paying 1·45 at the end of eight years' running, and in another case 1·79 on the fourth year of operation. There is no doubt that the reduction in the cost per unit is due to the improvement of the load factor, and it is gratifying to find from Table VIIa. how steadily this is increasing, having risen from 9·49 per cent. in 1896 to 12·76 per cent. in 1901.

Table VIIb., however, reveals the somewhat curious fact that the age of a station does not seem to have such a marked effect on the load factor as one would expect. A glance at Table VIII. will show perhaps better than anything else what an incubus these capital charges really are. Taking a summary of six years we find the following:

Total revenue		£6,323,933
,, costs		3,392,618
Gross profits		£2,931,315
Capital charges—Interest	£1,318,232	
Sinking fund	1,190,164	
		2,508,396
Net profit		£422,919

As to the effect on the cost of production, this may be summarised as follows:

Ordinary total cost of producing one unit		1·89d.
Capital charges—Interest	·73d.	
Sinking fund	·66d.	
		1·39d.
Total cost		3·28d.

There are really two separate points in connection with these capital charges which ought not to be confused. The first is the heavy capital expenditure for a given revenue-earning capacity, and the second is the short term for repayment which is allowed by the Local Government Board. As to the first, it is only natural, perhaps, to compare with the rival lighting concerns, and see how far the gas industry is affected. Taking the author's own town of Barrow as an example of an excellently managed and very successful municipal gas undertaking and comparing it with our own electricity works, we find that in the case of the former the revenue amounts to no less than 36·3 per cent. of the capital invested, whilst in the latter it is only 10·1 per cent. To put it in another way, the Gas Com-

Digitized by Google

mittee in order to produce £1 of revenue have only got to invest about £2. 15s., whilst the Electricity Committee have to spend no less than £10.

The fact of having to lay out more than three times the capital in order to produce the same revenue is surely in itself a sufficient handicap to the electricity undertaking; but when we consider the second phase of the subject—viz., the short period allowed for repayment—it makes matters much worse. Reverting again to the comparison at Barrow, we find that the gas undertaking, with a capital of £116,500, is only compelled to repay £1,056 for the year, whereas the electricity undertaking with a capital of less than half—viz., £54,846—is under obligation to repay actually more—viz., £1,079—the percentage working out in the one case at 0·9 per cent. and in the other 2·34 per cent. Apart from these capital charges the electricity undertaking would compare very favourably, the gross profit being 37·8 per cent. of the revenue, whilst in the case of gas t is only 25·4 per cent.

It may be a perfectly good subject for discussion, whether the 25 years allowed by the Local Government Board or the 42 years of the London County Council is the fairer; probably 30 (with perhaps 35 in some cases) would be about right, but the writer would prefer to err if anything on the side of safe and sound finance, if only the "powers that be" would see the necessity and advisability of suspending the sinking fund for the first three years. No one who has the interests of municipal trading really at heart would object to a repayment of capital on sound and safe lines. To build up a strong reserve fund (call it what you like) before contributing to the relief of rates ought to be the leading object of any electricity committee, but what we *do* object to, and that very strenuously, is being *compelled* to build up this reserve *out of the rates* in the first years of an undertaking when no profits are being made. It is this fear of a call on the rates, in the earlier stages, that causes 19 out of 20 stations to be built on such narrow lines, that extensions are wanted before even the original scheme is completed, and waste of capital results, which brings about the very evil which it is sought to avoid. So much was said on this subject during the past year that the author was loath to touch on it, but felt that a paper dealing with electricity supply from a financial point could not be complete without at least a reference to it.

Mr. W. A. CHAMEN, of Glasgow, opened the discussion, and said that the paper was a difficult one to criticise, and one which would be of great service to the members of the association. In the last part of the paper Alderman Smith had compared the working of gas and electric light undertakings. He had recently looked through the accounts of the Glasgow gas department and found that the cost of coal was 40 per cent. of the total revenue. In their electricity department the coal bill was only 12 per cent., which seemed to him to suggest that they had still a considerable margin to draw upon. He agreed with the author that a standard for the duration of electric lighting loans should be adopted throughout the country. It was a mistake to think they could now get loans for 62 years in Glasgow. Under their new Bill they had to repay at the rate of $2\frac{1}{2}$ per cent. per annum.

Mr. VESEY BROWN, an old member of the association, commented on the first few paragraphs of the paper. He argued that local authorities with small areas were now finding it more advantageous to transfer their provisional orders to private companies. He did not agree with the figures given in Table III., as he thought they made no allowance for the fact that a good number of the corporations supplied their own tramway systems, whereas only one company had a tramway load. He gave individual instances to show that the cost per kilowatt was frequently lower for companies than for local authorities in towns of the same size. The costs in the case of companies was also higher, because they had not street-lighting or tramways. As regards the depreciation in the case of companies, he thought that where large dividends were paid the shareholders should divide individually for depreciation out of these dividends.

Major-General WEBBER complained that companies were not placed on the same footing as local authorities with respect to rating and to the charges made for road repairs. High rates seriously handicapped the London company, and he thought in this respect the local authorities had a very great advantage. At the time Paris was divided up into secteurs for electric lighting purposes, this was provided against by a clause which fixed the maximum tax for rates at 10 or 11 per cent. on the income, which would otherwise be received by shareholders. In London the companies had to pay from 11 to 17 per cent. of their profits to the local authorities in rates. This income was not usually taken into account when considering the relative advantages of company and municipal management.

Bailie WILLOCK, of Glasgow, did not agree with Mr. Vesey Brown on the question of company finance. He thought that the directors in early years declared dividends without providing for depreciation, whereas local authorities had to pay their sinking fund charges even before the plant was used. At Glasgow they had gone most carefully into this matter. A few years ago they were supplying from a small station, which was completely filled with machinery, and which was worked to its utmost limits as regards output. In consequence, they had a large surplus at the end of the year. After Mr. Chamen joined them they had to lay down large new works, which they had to depreciate before they could be used, and in consequence the surplus had decreased. At the present time the small station was practically shut down, and they were going to sell the plant, which would have been quite able to supply the original load for which it was intended for another 50 years. This showed the need for depreciation funds, and he only hoped they would make as good prices for their old plant as Mr. Snell had succeeded in doing. He pointed out that the Government had very distinct views as to what was the profit of the undertaking, and insisted that in Glasgow they should pay income tax on their whole surplus of £24,000 before anything was written off for depreciation or reserve. He, personally, was in favour of writing off depreciation rather than establishing large reserve funds, which might be called upon at some time for the relief of the rates. They had quite decided on his Council that none of their undertakings should contribute to the relief of the rates, but that any reduction which could be made should be given to the consumers.

Bailie MACKENZIE, of Edinburgh, thought it was only an idle waste of time to compare the working of company with corporation undertakings. He thought that the fault in corporation management was that the fear of the November elections influenced sometimes the actions of the councillors. They had last year in Edinburgh earned the substantial profit of £14,000. When the report came before the Council last week, certain members demanded that £5,000 of this should be handed over for the relief of rates. It was this kind of proposal, brought forward by councillors who had not really considered the matter, which he so strongly deprecated in municipal control. He, personally, preferred a large reserve fund to writing off much depreciation, as with a reserve fund you had the money at hand. He believed in the municipalisation of such things as electricity, water, and gas, but strongly deprecated councils going into the supply of accessories and other small trading work.

Councillor SCOTT, of York, referring to Mr. Vesey Brown's remarks, said he did not share that gentleman's ideas of company management. He thought the directors did not pay high dividends in order that the individual shareholders might make their own reserve funds, but in order to increase the price of shares which afterwards would be unloaded on the public. He thought that all the figures in the paper were in favour of the municipal undertakings.

Councillor J. E. PANTON, of Bolton, said that he had worked out similar figures to those given in the paper some years ago, and that the advantages of municipal ownership was clearly shown before electric tramways were started. The reason, he thought, for the higher capital expenditure of the companies was that they often paid in shares instead of in cash for their machinery. He would point out to Major-General Webber in the country the local authorities had not anything to do with the rating. Having analysed accounts, he found that the municipal undertaking on an average provided twice as much for depreciation as did the companies.

Mr. W. L. MADGEN strongly resented the remarks of Councillor Scott as to the integrity of company directors. With respect to Table III., which showed an average cost of £90 per kilowatt for the municipalities as against £117 for the companies, the figures did not include a certain amount of preliminary expenses. The comparison also

Digitized by Google

neglected the question of the length of mains. When considering the figures of cost, it should be remembered that the success at Liverpool and Leeds had been gained under company management. In his opinion, there was more credit due to the engineer who could make a small undertaking successful. He concluded by suggesting that the paper might better be termed "early thoughts on electric supply."

Alderman SMITH, in reply, said that the difference introduced by tramway plant was exceedingly small. As a rule, with the tramway undertaking the corporation had to supply feeders, and he had found that the ratio both in cost and management in favour of corporation management had not altered of recent years. The discussion had taken up the controversy between the two systems of management. He had not intended that this should be so, but it must be remembered that the war had been commenced by the company exponents, who complained that the corporations had not provided for depreciation. Enquiry had shown that the companies themselves were more to blame in this matter. He was sorry to hear for the first time from Mr. Madgen that the figures published regularly in *Lightning* were not correct, as they had been largely used throughout the country.

A hearty vote of thanks to Alderman Smith was then given, and the following paper by Mr. W. A. Chamen was taken as read.

The Possibilities of Future Economies in Electrical Illumination.

BY W. A. CHAMEN, CITY ELECTRICAL ENGINEER, GLASGOW.

The question of possible future economies in electric illumination is one of very considerable importance. There is hardly need to point out that if the economy is brought about by consuming a smaller amount of energy to produce a given amount of light, the ultimate result is not a reduction of revenue to the undertaking, but an increase, owing to the larger number of consumers who adopt electric light in preference to the older means of illumination, as well as to the more generous use of it by existing consumers. There is also another advantage to the undertaking in the reduction of the proportion which the peak lighting load bears to power or other day load, though it may be some time before this becomes noticeable. The subject of possible economies in illumination, however, covers a wider field than the saving in consumption of energy, for any reduction which can be made in the cost of maintenance of the lamps, and particularly in the trimming and attendance on arc lamps, may come within the scope of this paper. No doubt the question of cost of production of energy also might fairly be treated as part of the subject, but it is not proposed now to deal with that matter at all.

Our attention is naturally drawn first to the ordinary incandescent lamp as we know it to-day and have known it for some years past. Is there any probability that the carbon filament is capable of being worked, with satisfaction as to its lasting properties, at any materially higher efficiency than the 3½ to 4½ watts per candle-power to which we are accustomed? The outlook in this direction does not seem very encouraging, though some 8-c.p. 250-volt lamps recently tested in Glasgow have started with an efficiency of 3½ watts per candle, while after 600 hours of burning the efficiency has not gone below 4½ watts per candle, thus showing that this degree of efficiency is not confined to lamps of 16 c.p. or over. Some 12 months or more ago an incandescent lamp bearing the name of "Crawford-Voelker," was brought out, having a filament alleged to be made of some carbide and promising considerable improvement in efficiency as well as long life. As, however, nothing has been heard of this lamp for some time, it must be assumed that some difficulties have arisen in its manufacture which have so far prevented its coming into the market.

The next lamp to claim our attention is a departure from the ordinary filament in vacuum. It is the now fairly well-known Nernst lamp. In Glasgow alone it is stated that there are about 10,000 of these lamps in use in ordinary consumers' premises. A large number of them have been in use in Buckingham Palace for some 13 months past and have given great satisfaction, having reduced the consumption of current by about 50 per cent. The large clock at the Houses of Parliament has also now been lighted by Nernst lamps, and very satisfactory starts have been made in its adoption for street-lighting at Maidstone, Barking, Barnes, Colchester, Gravesend, Erith, and Brighton, and experiments in this direction have been in progress in Glasgow for over six months past. Indeed, it is a question whether the Nernst lamp should be classed as a possibility of the future or not rather a realisation of the present time. The results of recent experience from several different sources show that an average life of 600 hours is by no means too much to expect, and doubtless this figure will be improved upon as time goes on. As regards economy, the claim put forward is that, light for light, the Nernst lamp consumes about half the energy consumed by the ordinary carbon-filament incandescent lamp. Assuming the useful life of the latter to be about 800 hours, and that, roughly, eight lamps of 16 c.p. will give as much light as one one-ampere 250-volt Nernst lamp, it will be seen that at an efficiency of four watts per candle some 409 units will be consumed by eight ordinary 16-c.p. lamps in 800 hours, the cost of which, at, say, 4d. per unit, equals about £6. 16s., to which must be added the cost of renewals—viz., eight lamps at, say, 1s. each = 8s., or a total of £7. 4s. With the Nernst lamp the cost of energy will be about £3. 8s., to which must be added the cost of renewals, or, say, one and one-third times 3s. 6d. (if we include the resistance as well), say 4s. 8d., a total of £3. 12s. 8d., being a saving of £3. 11s. 4d., or nearly 50 per cent. This is a good margin to allow for even more frequent renewals of Nernst filaments, etc., and the average Glasgow consumer has not been slow to grasp the point, particularly in business premises, where the charge for energy is 6d. per unit for the first 365 hours' use of maximum demand, and 1d. per unit for all further quantity. The fact that the filament requires heating before it will conduct the current, an operation requiring about half a minute, is against the Nernst lamp to some extent, but in many cases it is of no real consequence. It is, so far, not made in very small sizes, the smallest absorbing one quarter of an ampere (which equals, at 250 volts pressure, about as much energy as is consumed by one ordinary 16-c.p. lamp), but giving a light of fully 32 c.p. This is too large a unit of light for ordinary domestic use, and, combined with the last-named disadvantage of not lighting immediately when switched on, is, perhaps, the reason why it has not found its way to a larger extent into private houses. For perfection of lighting, however, in a large room, a one-ampere Nernst lamp fixed near the ceiling, with a nearly opaque shade beneath it, so that nearly all the light is reflected off the ceiling, is hard to beat.

It is not within the scope of this paper to discuss the details of manufacture of any lamp, but one cannot help remarking that as substances are evidently known which will give off a brilliant light when heated to a moderate extent, as in the incandescent gas mantle and the Nernst lamp, there is no apparent reason why some combination of carbon filament with one or other of these materials should not be evolved, which will combine the advantage of instantaneous lighting with that of high efficiency. This, however, is no new idea, as many inventors are said to have been at work taking out patents for various combinations. Perhaps a little more work in the laboratory and a little less at the patents might have produced the result we are now awaiting. The "Meridian" lamp, which is apparently being made by the General Electric Company of America, may be a step in this direction, though no information as to the composition of its filament is at present available. It seems only to be made in one size of 55 c.p., and the efficiency claimed for it is a consumption of about two watts per candle. No lamps can, however, be obtained to experiment with up to the time of writing this paper.

In passing away from filament lamps our attention is first attracted by the Hewitt mercury vapour lamp, which is now well known by repute to most electrical engineers, but which has been seen, perhaps, by comparatively few. It consists of a glass tube about 1in. in diameter and some 3ft. or 4ft. long, having a bulb at the bottom containing mercury and an iron electrode at the top. The tube is hermetically sealed, and the air is exhausted to a considerable degree. The electric current is passed through the tube from the electrode at the top, which is connected to the positive pole of the circuit to the mercury in the bottom. The working pressure for a tube some 3ft. or 4ft. in length is about 100 volts, but a much higher pressure is required to start it. This is produced by the insertion of a simple self-induction coil connected in the lamp circuit and coupled up with a switch in such a way that the tube can be momentarily short-circuited, thus putting the coil direct on to the 100 volts pressure. On breaking this switch the kick or extra E.M.F. produced by the coil forces a passage through the tube, starting the mercury into vapour, and immediately a steady current commences to flow. The light at first is tinged with purple, but as the tube warms up it becomes whiter. The peculiarity of the light itself is that there are no red rays in it, and its effect upon the beauty of a rosy complexion is disastrous. This cannot, of course, be set right by making the tube of red glass. A plate of red glass, which will let through floods of red light from a ray of sunshine, acts almost like a total eclipse when applied to the Hewitt lamp.

Here again, however, it would seem possible by means of combination—that is to say, by mixing something with the mercury—to produce light of a different character, having red rays in it, which would remove this one objection. Even as

Digitized by Google

it is, it could be used for street-lighting and similar purposes with great advantage, for its economy is of a high order, the consumption of energy being only about half a watt per candle-power, or about the same as that of the ordinary open-type arc lamp. It is claimed that the lamp can be made in any size, from a tube ⅛in. diameter and 3in. in length to 3in. diameter and 12ft. in length, while the range of illumination may vary from 16 c.p. to several thousands, according to the size of the tube. Voltage seems to present no difficulty, as lamps can be made to work at any pressure from 50 to 500 volts. A peculiarity of the lamp, apart from its light, is that the current will only pass through it in one direction—viz., from the iron to the mercury (if we are right in saying that the current flows out along the positive wire and back the negative). Alternating current will not pass through the lamp, and a modification of it is made, called the "Hewitt static converter," which will let through only those waves of alternating current which are above or below the zero line, as the case may be. This recalls to one's mind the amusing remark made by Mr. Mordey some years ago that "one of the great advantages of alternating current was the impossibility of using accumulators with it." The Hewitt lamp seems to have a great future before it. One cannot but feel that the absence of red rays is an objection that will be overcome. Its economy leaves little to be desired if it can be maintained in small sizes, and its length of life seems to know no limit, except that after every 1,200 or 1,400 hours of use the tube requires opening and washing out. It is then, when re-exhausted, as good as new.

Turning our attention now to arc lamps, we find by mixing various substances with the carbon during the process of manufacture that it becomes possible to completely alter the nature of the electric arc flowing between carbon points as we have known it hitherto. The arc, for instance, in the Bremer and other arc lamps of the "flame" type is much prolonged and the light can be coloured with various tints, the most common and, probably, the most satisfactory being yellow, somewhat approaching orange. Instead of the light being almost entirely emitted from the crater of the positive carbon, it now proceeds from the carbon particles or vapour froming the arc itself, which in many respects resembles a gas flame, as the name given to this type of arc lamp implies. The efficiency of the light is also very largely increased, for instead of the consumption of half a watt per candle, which is usually obtained with the ordinary 10-ampere arc lamp of the open type, it is now reduced to about a quarter of a watt per candle. There are, however, still some objections and difficulties to be overcome before this type of lamp can come into general use for street-lighting. Firstly, the consumption of carbon is very much greater than with the ordinary type of arc lamp, thus necessitating trimming at more frequent intervals. Secondly, the light is not so steady as that of the ordinary arc, having a continual quiver rather like a badly burning gas flame. Thirdly, it does not seem to have been possible so far to produce a satisfactory burning lamp which will give the same candle-power as the present 10-ampere lamp with a consumption of only half the energy. All that has been brought about seems to be the doubling of the light without altering the present consumption of energy, and this is hardly what is required in ordinary street-lighting. The light given by an ordinary open arc of 10 amperes (which one may take as being in round figures 1,000 c.p.) is a sufficiently large unit for almost any class of street-lighting, and in many cases a 7½-ampere lamp is ample for the purpose. One cannot but feel, however, that all these difficulties will in one way or another disappear as time goes on and as various further improvements are developed.

Another departure in arc lighting is worth our attention—viz., the "very small current" arc lamp, consuming about one ampere and burning either with an enclosed or an open arc. That an arc can be maintained with so small a current with a fair degree of satisfaction seems to be beyond doubt, and the only question is whether in actual cost of maintenance it will prove cheaper than the Nernst lamp or the mercury vapour lamp. No actual experience appears to have yet been gained regarding the cost of maintaining these small lamps for long hours of burning, but it does not appear probable that they can do better than the Nernst lamp when one takes into account the cost of retrimming, etc. The enclosed arc lamp can scarcely be dealt with as a possible source of future economy, it having been for some years past a recognised and readily obtained marketable article. Beyond the fact that it increases the hours of burning without retrimming, there is not much to be said for it, as it certainly does not appear to reduce the consumption of energy per candle-power as compared with the ordinary arc. It has done considerable good, however, by spurring on the makers of the ordinary open-type arc lamp to produce lamps which will burn longer hours without retrimming, this being brought about by simply increasing the length of carbon which a lamp can take at one filling. The 38 or 40 hour arc lamp with two pairs of carbons is in use in most electric-lighted towns in the United Kingdom, the method of working usually being to trim alternate lamps each day, thus doubling the number of arc lamps which can be put under the charge of one trimmer and his mate, as compared with the old method, when the lamps would burn through one night only. At the present time 60-hour lamps are to be obtained in the market, and the Thames Embankment in London is probably one of the best instances of the adoption of this long-hour type of lamp. It obviously allows of every third lamp being trimmed each day, and thus of putting three times the number of lamps under the control of one trimmer and his mate, as compared with the old single-night lamps. There are rumours that even 80-hour lamps may be forthcoming, but it is well not to jump too hurriedly to conclusions.

In some towns raising and lowering gear is used upon the arc lamp-posts, the object being to enable one man—*i.e.*, the trimmer only—to go his round without the assistance of a mate to help him with the ladder. Whether there is any real economy brought about by the introduction of this hoisting gear is not quite clear. It obviously depends upon the original cost of the hoisting gear and the annual cost of its maintenance. Those engineers who have to deal with large numbers of arc lamps in big cities will doubtless feel more comfortable in their minds if they adhere to the fixed suspension arrangement which is mostly in use, as the risk of accidents in large cities is beyond question far greater than in provincial towns. It may be reckoned that the saving of labour by the adoption of 60-hour instead of 40-hour lamps would be about 11s. per lamp per annum, and in places where the number of arc lamps approaches a thousand or may be considerably more, this is a saving which amounts to a considerable total in the year. The possibilities of economy in the use of the ordinary arc lamp for street-lighting do not therefore appear to be yet exhausted.

To summarise, therefore, briefly the results of our enquiries, it may surely be stated without much stretch of imagination that the possibilities of future economies in electric illumination for all purposes are considerable, and even that we may hope to see the consumption of energy for a given amount of light cut down by something approaching one half of the present figure, besides reaping the benefits of other economies of maintenance, at any rate as regards street-lighting. This paper is necessarily very incomplete, but if it should serve to bring out further information in the course of this discussion, it will not have been written altogether in vain.

Mr. J. W. SWAN opened the discussion by commenting on the possible increases in efficiency of carbon-filament lamps. He thought that this improvement would be considerable, but it would involve the lamps being worked very near their breaking point, and hence on an extremely heavy voltage. The comparison made by the author between the carbon lamp and the Nernst lamp was not a fair one, because he had compared eight 16-c.p. lamps with a single Nernst lamp of 128 c.p. If a carbon-filament lamp of the same candle-power had been taken for comparison, the difference would have been much less marked, as the efficiency of such a lamp would be from 2 to 2½ watts per candle-power. The life of such a lamp would be long enough to make it economical, although he rather preferred smaller units, as they gave a more distributive illumination.

Mr. STONEY advocated the over-running of lamps even when they had to be renewed after 100 hours owing to blackening. He gave some good figures for the life of Nernst lamps, and said that a most excellent light was obtained by having a Nernst and a carbon lamp on the same bracket.

Mr. A. E. HOADLEY, of Maidstone, gave some figures he had obtained for Nernst lamps for street-lighting. He found that if the rod lasted for over a few hours, it would stand, as a rule, over 700 hours. He thought that the shape of the burner needed to be altered to be more suitable for reflectors to spread the light economically. In this respect the form of the incandescent light burner was a great advantage to its users.

Mr. W. L. CHAMEN, in reply, thanked Mr. Swan for his remarks, and also Mr. Hoadley. He said that, in spite of the theoretical advantage of small candle-power lamp for giving a distributed light, the larger units were more used in practice.

The company then adjourned to the town hall, where they were entertained to lunch by the Mayor and Corporation.

(To be continued.)

Book Received.—Mr. Edward Stanford, London, has published "Annals and Aims of the Pacific Cable," edited by Mr. George Johnson. The price is 6s.

TRADE NOTICES AND NOVELTIES.

Crompton 250-kw. Three-Phase Alternator for Bloemfontein (South Africa) Corporation.

This alternator, of which we give an illustration herewith, is of Messrs. Crompton's standard three-phase pattern, designed for an output of 250 kilo-volt-amperes at 2,200 volts per phase, the periodicity of the circuit being 50 complete cycles per second. The machine has a stationary armature, the coils being fitted in open slots, and held in position by hardwood dovetails. The armature can be moved along the bedplate to give access to the machine, a barring rack being provided on the bedplate for this purpose. The end windings are fully protected by suitable end covers, one of which is arranged to form a terminal box for the main current. The field magnets are of the rotating type, with radial poles, the pole-pieces being laminated and bolted to a cast-steel hub. The hub is extended to form a half coupling, and connected direct to the flywheel of the engine, strains on the shaft thus being avoided. A direct-coupled exciter of the multipolar type is mounted on an extension of the alternator spindle. The engine is of Messrs. Belliss and Morcom's three-crank triple-expansion type, designed to work on 160lb. steam pressure at the stop valve, and capable of driving the generator either condensing or non-condensing. The speed of the combined set is 375 revolutions per minute. Two of these sets were built by Messrs. Crompton and Co. for the Bloemfontein Corporation under the specification issued by Mr. Robert Hammond, and at the official tests at Messrs. Belliss's works the machines exceeded in every way their guarantees, as shown in the table given below :

	Specified.	Actual.
Temperature rise after 10 hours' run at full load—armature	65° F.	39° F.
Ditto field	65° F.	18° F.
Steam consumption in pounds per kilo-watt-hour	26	24·4
Voltage drop from no load to full non-inductive load	7 %	4·5 %
Exciting watts	3,500	2,100

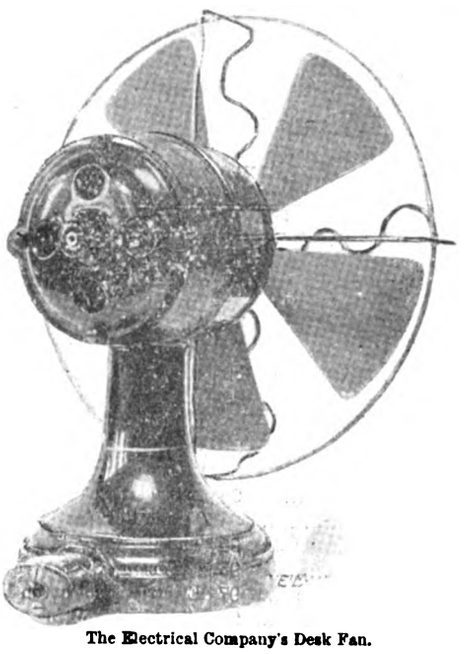
In addition, the sets were tested under severe conditions for parallel running, and gave most unqualified satisfaction to the consulting engineer. The governor trials also fully realised the expectations of the English builders. We understand that Messrs. Crompton and Co. are now manufacturing a complete line of single and polyphase generators and motors, and have some important orders for this class of machinery in hand at the present time.

Callender's Telegraph Construction Company.

Under the above title the Callender Company have just issued a well-printed album, containing a large collection of photographs of the work executed by them in all parts of the inhabitated globe, containing views of many places which were not dreamed of in our "jography" in the days when we went to school. The pictures include scenes of Messrs. Callender's men at work laying cables at Christiania, Odessa, Aalberg, Copenhagen, Gibraltar, Barcelona, Madrid, Durban, the Sheba Gold Mines (South Africa), Colombo, Calcutta, Alipore, Sydney, Auckland, Mexico, etc.

Desk Fan.

The accompanying illustration shows one of the desk fans made by the Electrical Company, Charing Cross-road, a specimen of which we have recently had under observation. These little fans are very neat and compact and take up a minimum of space on the table. They are made of various voltages, and are very well made indeed. The apparatus should



The Electrical Company's Desk Fan.

be well appreciated in basement offices especially, and in London offices generally in the summer—when there is any summer.

Catalogues and Pamphlets Received.

LAURENCE, SCOTT, AND CO., LIMITED, Gothic Works, Norwich: Pocket list (illustrated) containing revised prices of semi-enclosed motors for continuous current of various voltages. These 1903 motors retain all the leading characteristics of the 1900 type of machines, and the armatures, bearings, etc., are interchangeable with them. The alteration from the cast-iron yoke frames with steel magnet cores cast into cast-steel yoke frames and magnet cores has been made because these latter, in excellent metal for the purpose, can now be obtained with much more facility than formerly, and the firm have taken the opportunity afforded by this alteration to make many minor improvements that experience has shown are desirable. Much more space is allowed round the commutator and brush gear, and the ventilation has been improved without materially diminishing the protection afforded by the end brackets, and these being of larger diameter, the magnet coils are also made more accessible. In fact, so much has the design been improved in these respects that the firm are now supplying large numbers as dynamos, both for belt driving and for direct coupling.

MUNICIPAL ELECTRICAL ENGINEERS.

The eighth annual convention of this association is being held this year in the Sunderland district, under the presidency of Mr. J. F. C. Snell, the electrical engineer of Sunderland. A gentleman once remarked to us that if he had the choice of a profession he would be either a schoolmaster, clergyman, or naval officer, because each of them can say his say and give his orders without discussion or contradiction. Right or wrong, the say is said; and right or wrong, the order is given and obeyed. Ordinarily, the president of an association is in a similar position so far as his presidential address is concerned. It is not fashionable, nor would it be tolerable if it were discussed by his audience, but members of the Fourth Estate are privileged, and can make a presidential text the moral of a sermon. We all are, or ought to be, trying to arrive at the truth. The principal text of Mr. Snell's address dealt with the vexed question of depreciation—a subject upon which there seems to be any amount of divergent opinion. Why it is so, we cannot understand, except that every man is fighting for his own hand, and so long as he gets what he wants, does not care if his gain be a disadvantage to another. Before passing to the main text of the address, we may be permitted to refer to the remark that "during the last year there has been an outburst from a section of the community against municipalisation, and there can be no question that Parliament apparently intends to restrict us to narrower bounds." Of course, the agitation against a certain phase of municipalisation has had a longer life, and we contend the agitation is perfectly justified, in order to obtain a legislative and legal boundary to municipal vagaries. The Lord Provost of Glasgow last week in welcoming to Glasgow the Municipal Tramways Association referred to the Glasgow authorities as being pioneers in tramway work of a municipal character. This is true in a measure, but really all the pioneering work to prove electric traction practical and commercially successful was done by private enterprise. Municipalities cannot pioneer is the usual acceptation of that term, so that the opposition has something on its side when it says, "Private enterprise pioneers, and municipalities take the reward." That term "in its infancy" has been used both for blessing and cursing but usually it is put forward by men as indicating there exists a doubt about pecuniary success. There are many other reasons for enquiry into and regulation of municipal trading. Now, one point as to depreciation. Mr. Snell says: "There is a class of critic which affirms that municipalities are not working on a financially sound basis because the majority of them do not form any depreciation fund, or at least have not yet commenced to form one. These critics state that in order to be sound we ought to pay off our capital by sinking fund as at present, and, in addition, to form a sufficient and separate depreciation fund." "A class of critic which affirms." What class? It is sometimes necessary to enquire into motives as well as to count heads. The class referred to consists principally of those connected with companies competing or wanting to compete with municipalities, or to stop municipalities from doing anything at all. An opposition is bound to oppose, but we are not necessarily bound to take its affirmations at their face value, or, indeed, at any value at all; and in this particular case the less credit is to be given to the affirmation, in that the critics do not follow their own suggestion. Analyse carefully the balance-sheets of various companies, and if you are anything of a prude in matters financial your hair will stand on end. In hardly

Digitized by Google

a single case—we know not even one—do they practice what they preach, hence their preaching is and will remain ineffective. Both municipalities and companies want a certain twenty shillings in the pound, and if they have it, they are all right. Mr. Snell goes on to point out the differences in the—shall we call it—legal time of repayment of loans—forty-two years in some cases, twenty-five years and thirty years in others—and justly argues that something is wrong under these circumstances. Mr. Snell says: "We must look squarely at this fact. Some of the plant in both electricity and tramway concerns has a shorter life than the twenty-five or thirty years allowed by the Local Government Board—some a much longer." Mr. Snell himself, from the Sunderland undertaking, comes to an average of 42·8 years, and his conclusions are summed up in the following words: "I want to see municipalities placed on a par with admittedly well-regulated companies, and I believe that the extended period of repayment, the compulsory formation of a depreciation fund in addition to this extended (forty-two years) sinking fund, and an enquiry upon each loan by a properly constituted section of the Board of Trade . . . would prove a panacea for the present evils." Candidly, we do not agree with Mr. Snell, nor do we think the terms he uses to be the correct ones. Taking this latter point first, and assume a capital expenditure of £42,000, he would repay it on the forty-two years' plan at the rate of £1,000 a year, and would depreciate—how much? Upon the existing system (twenty-five years) he would repay at the rate of £1,680 a year. Probably the only difference in carrying out Mr. Snell's views would be to pay off £1,000 and depreciate £680, a distinction without much difference. With regard to the other point, there seems to be some inability to understand that an "average" does provide for the short-lived portion of the plant as well as the long-lived portion—the average depreciation at too great a rate on the one hand and at too slow a rate on the other, thus equalising matters. To discuss this admirable and thoughtful address as it deserves is altogether out of the question in a short article. Would it be impossible to get a meeting of those interested under the auspices of the association, and go thoroughly into the whole matter? It is evident that most engineers having responsibility want three things: (1) to pay off capital; (2) to have a renewal fund to draw upon without fresh borrowing; and (3) to keep the plant in a state of perfect efficiency. Users have to pay, and the question resolves itself into, Is this huge demand a fair bargain with buyers? Going on as at present, twenty-five years hence A will have a station standing in the books as costing nothing, it will have a plant efficient and standing in the books at zero, and if depreciation is also compulsory, it will have a renewal fund upon which to draw for new plant. Can any company be named where these conditions exist?

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

601. It is desired to add condensing plant to an electric light station. It is proposed to draw the circulating water from the sea, which is at hand and is 25ft. below level of condenser at low water, by means of a pair of suction pumps. What precautions must be taken in putting down the pumps and piping? Is it the case that a U-bend in the pipe interferes appreciably with the suction?—D. R.

602. Describe a suitable form of sand-drying stove capable of delivering one ton of dry sand per day for use in car hoppers. The car-shed does not adjoin the power-house, so that flue gases are not available. Discuss the relative advantages of hand and mechanical feeding in such an apparatus.—C. M.

ANSWERS.

Question No. 593.—Suppose a bipolar continuous-current dynamo to be excited with an alternating current so that any one conductor on the armature is always moving in a field of the same polarity, would the machine generate any E.M.F.?

Best Answer to No. 593 (*awarded* 10*s.*).—Since in the above case the machine is excited with an alternating current, the result of such excitation will be an alternating magnetic flux surging to and fro through the armature. Also, since the question indicates that any *one* conductor is always moving in a field of the same polarity, the frequency of the exciting current must correspond and be equal to the speed. Thus, if the speed is 3,000 revolutions per minute, or 50 revolutions per second, then it is essential to fulfil the above condition that the frequency of the current be 50 ~ per second. Also the indication that any one conductor is always fulfilling the above condition does not imply that every conductor is acting in that way. For it can be proved that such is not the case that there are only two conductors or sets of conductors which do act as indicated, and these conductors are diametrically opposite each

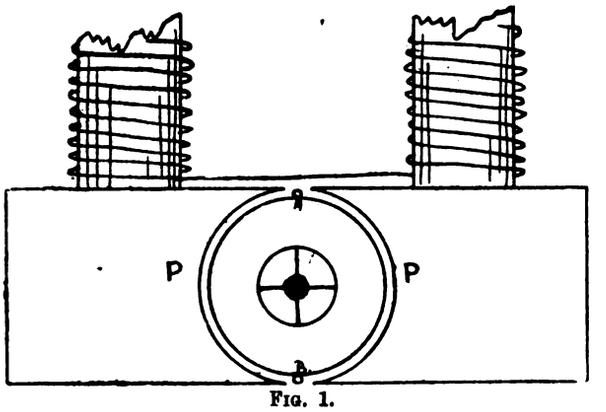

FIG. 1.

other. Fig. 1 shows a diagrammatic sketch of the field magnets and armature of a two-pole dynamo, with A and B, two conductors diametrically opposite, represented in the position of worst action in a uniform unidirectional magnetic field. It is at this point in such a field that the conductors begin to move in a field of the opposite polarity to which they have moved in during half revolution before they reach this point. But if the conductor is at this point when the field reverses, then the conductor will always move in a field of the same polarity. With any other conductors in other positions of the periphery of the armature, however, such is not the case, since the field in which they move will reverse its polarity when the exciting current reaches its zero value, and also when the conductor reaches the positions occupied in Fig. 1 by A and B, making four reversals of the field in which the conductor moves per revolution of that conductor. Hence A and B in Fig. 1 are the only conductors always moving in a field of the same polarity.

Now, as to whether the machine would generate any E.M.F. Since each conductor is not placed in the same position on the armature relatively to the alternating character of the magnetic flux, it is advisable to consider what takes place in each conductor per revolution, considering the conductors separately. Every conductor need not be taken, as it is not a question of calculation, but of action.

Digitized by Google

Certain conductors placed equidistant from each other on the periphery of the armature need only be taken. As in Fig. 2, A and B, C and D, E and F, G and H will be considered, and the question as to whether any E.M.F. will be generated can be solved from these. In considering the actions taking place in each conductor there are two causes which combine to produce an effect. The first is that of the alternating magnetic flux, and the other is that of the relative motion of the conductor, because in a uniform field the number of lines cut by the conductor is not the same in all positions of the

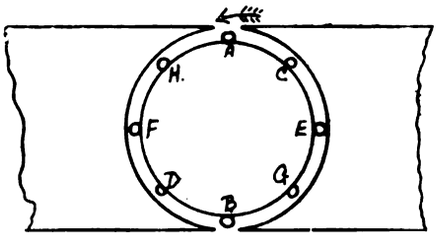

FIG. 2.

field—there are positions of best action and also of worst action. Taking, therefore, the conductor, A, in Fig. 2 in the position shown when the magnetic field has a zero value, the E.M.F. then generated in this conductor has a zero value also. Supposing the armature to revolve in the direction of the arrow head, as the conductor, A, moves the field is strengthened, increasing the number of lines pervading the armature until a position 90deg. to the former is attained, and then decreases to its zero value, and then changes its direction. If the conductor had been

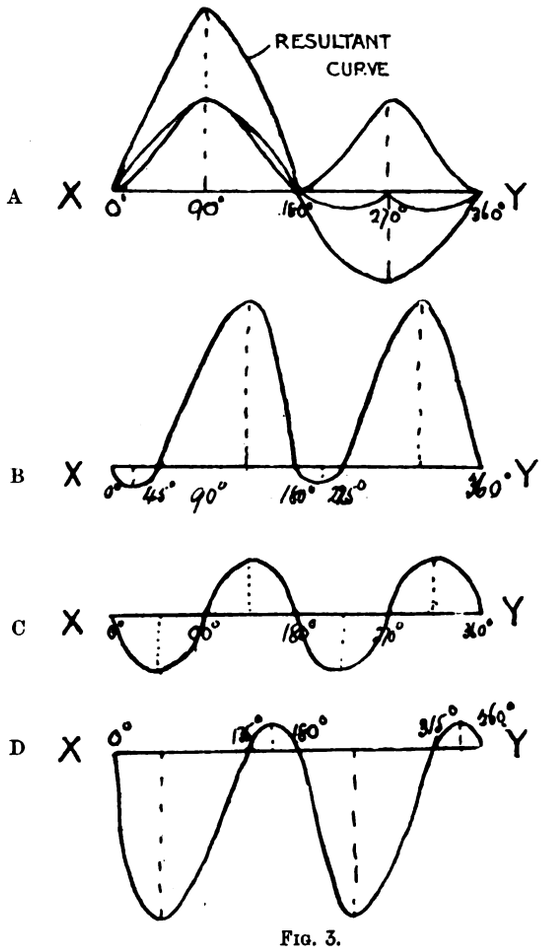

FIG. 3.

stationary, the E.M.F. generated in it would have had the same character as the magnetic flux, excepting that whereas the flux changes its direction, the E.M.F. does not, because that conductor is always moving in a field of the same polarity. This can be shown in a curve (Fig. 3A) which represents the character of the E.M.F. with the line $x\ y$ representing one revolution. On this line $x\ y$ can also be placed the curve which would be obtained if the field was a uniform unidirectional field with the armature rotating. Combining these two curves we obtain the character of the E.M.F. generated in that conductor during one revolution. This also applies to the conductor B, with the exception that the sign of the E.M.F. is changed, because it is moving in a field of the opposite polarity to A. Taking now conductor C, in Fig. 2, in the position shown, 45deg. behind A, when the flux has a zero value, hence no E.M.F. is generated in this conductor at that position. When it has reached the position 45deg. ahead, there is no E.M.F. generated in it. Moving till it reaches the position diametrically opposite its initial position, the flux again has a zero value, therefore no E.M.F. Moving 45deg. further, the conductor is again in another position where no E.M.F. is generated in this conductor. These alternations of E.M.F. can be placed as in Fig. 3B, where $x\ y$ again represent one revolution. This curve shows somewhat the character of the E.M.F. generated in the conductor C. This curve applies to the conductor D, save that the sign of the E.M.F. is changed.

Taking, now, conductor E, in Fig. 2, 90deg. behind A when the flux has zero value, hence no E.M.F. is generated in the conductor at that position. After moving through 90deg., it attains a position again when no E.M.F. is generated in it, and still another 90deg. when the flux has again its zero value, and therefore E.M.F. in the conductor. Moving through another 90deg., it reaches the last position in the revolution, where no E.M.F. is generated in the conductor. Plotting these points of no E.M.F. on the line $x\ y$ in Fig. 3C, we can construct a curve characteristic of the E.M.F. generated in the conductor.

Taking, now, the last to be considered, G, in Fig. 2, in the position shown 135deg. behind A, when the flux has a zero value, also it will have a zero value when the conductor has moved 180deg., therefore these are positions of no E.M.F. Also, when the conductor has moved through 135deg. and 315deg. to the positions of worst actions, again is no E.M.F. generated in it. These four points of no E.M.F. can be plotted on the line $x\ y$ in Fig. 3D, and the characteristic curve of the E.M.F. generated in the conductor can be constructed.

Combining all the four curves thus obtained together, we shall get a resultant curve which will approximately show the character of the E.M.F. generated in the armature. This curve is shown in Fig. 4, and shows that an

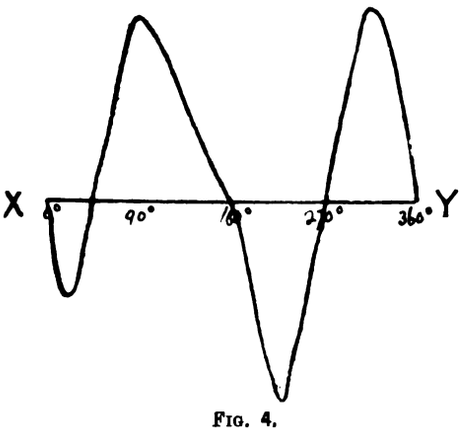

FIG. 4.

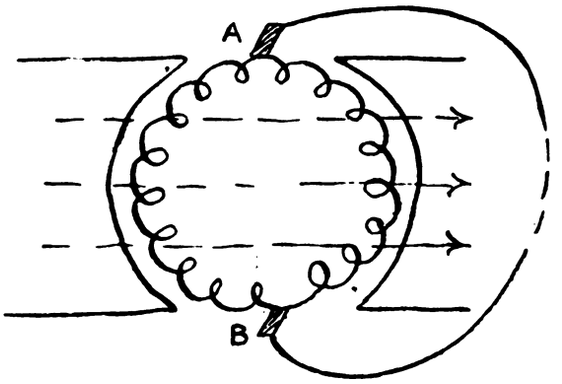
E.M.F. is generated in the armature; but the peculiar part about it is that though there is a commutator which rectifies the E.M.F. generated in a uniform field, the E.M.F. generated under the conditions enumerated in the question is an alternating one of an irregular character, which can be seen from the curve, the E.M.F. having a periodicity double that of the exciting current.—G. W. B.

Answer to No. 593 (*awarded 7s. 6d.*).—In order to determine what happens in the example given by the question, let us take the case of an ordinary two-pole continuous-current dynamo and see what happens. We have here a flux which is constant in magnitude and direction, in which is revolved two parallel circuits of conductors in series. The number of conductors in series is unaltered as the armature revolves, since as each individual bar leaves one circuit for the other by passing under a brush, another takes its place by passing under the other brush. We thus see that if the

Digitized by Google

speed is kept constant the volts must also be constant, since the "lines cut per second × conductors" is constant.

If, now, instead of a flux which is constant in direction and magnitude, we substitute an alternating flux as given in the question, everything else remaining the same, the number of lines cut at any instant will evidently vary, and hence, as the voltage depends on the product, "lines cut × conductors," the voltage generated between the two brushes, A and B, will also vary. During one alternation of the flux cycle the brush A is positive with regard to B; when the flux is zero the voltage between A and B must be zero, and during the other alternation of the period the brush A is negative with regard to B. We thus see that the voltage generated between the two brushes, A and B, is an alternating voltage, and is of and follows exactly the periodicity of the alternating flux—*i.e.*, the alternating exciting current.



This periodicity is evidently unaltered if we vary the speed, the only effect of this being clearly to increase the rate of cutting lines, and hence the voltage. Hence we have an alternator which will give constant periodicity—*i.e.*, that of the exciting current—however we vary the speed, and the voltage of which varies directly as we vary the speed.

We can now see that if we introduce the second condition mentioned in the question—namely, that any one conductor on the armature is always moving in a field of the same polarity—*i.e.*, the armature is revolving in synchronism with the flux—all we should get would be a particular value for the voltage, since the number of revolutions per second of the armature would then be equal to the periodicity of the exciting current, the alternating voltage being, as mentioned above, directly proportional to the speed. What I think "F. C. P." had in his mind was a polyphase induction motor. In this case, when any one conductor of the rotor is always moving so as to be in a field of the same polarity, the rotor is running in synchronism, and there is no "slip." Here, however, we have a *rotating*, not an *alternating*, field. The flux never sinks down to zero, but remains about constant in value, and the magnetic poles actually travel round the circumference of the stator instead of pumping to and fro in one constant direction. If, then, the rotor conductors move always in the same field—*i.e.*, at the same rate as the revolving flux—it is evident that they can cut no lines, and hence no voltage is produced. An induction motor can never quite reach synchronous speed, since there must always be some losses to make up—*e.g.*, bearing friction and iron loss—and these will tend to hold the rotor back to such an extent that the "slipping" back from synchronous speed is just sufficient to set up an E.M.F. in the rotor windings which will send a current through them of sufficient strength to satisfy the equation,

$$\text{Constant} \times \text{rotor conductors} \times \text{flux} \times \text{speed} = \text{torque due to losses, etc.}$$

In the case of a generator the rotor, of course, could be driven at synchronous speed, but, as explained above, it would generate no volts. If the rotor be, however, driven above synchronous speed, it will then cut lines and generate an E.M.F. This system of polyphase generators has lately been introduced by Alexander Heyland, and has several important advantages.

The arrangement given in the question is a reversed dynamo. If we were to take an ordinary two-pole dynamo without any commutator, connect the armature conductors in series, and bring the ends out to two slip-rings, and then revolve the armature in a constant field, we should, of course, get an alternating current, the ⌒⌣ and voltage of which would vary directly as the speed. A commutator if fitted would turn this in a direct-current machine. If, now, we next change the field to an alternating one, we shall again come back to an alternating current, only now the volts alone will vary with the speed. We should in this case have to laminate our field frame and poles as well as the armature, or the losses due to eddy currents caused by the alternating flux would enormously increase the exciting current required, and bring down the efficiency to a very low figure.

Another difficulty in working a machine of this sort is that of commutation. In addition to the volts of self-induction of the short-circuited coil due to the change of current during commutation, which is the cause of sparking in ordinary continuous-current dynamos, we should have two new effects coming in, both of which are probably worse than it is: first, the self-induction volts due to the fact that the current through the armature is an alternating one; and, secondly, the self-induction volts due to the fact that the short-circuited armature coil acts as a short-circuited secondary of a transformer due to the alternating flux set up by the field coils (which act as primaries) pumping through it. All these three voltages add up and produce a large potential difference at the terminals of the coil, which sets up a large circulating current around it and through the brushes, so causing a good display of pyrotechnics. It is easy to calculate the value of the alternating voltage which will be set up by a machine arranged in this way. Knowing the number of turns on the field, and the value of the alternating exciting current at any moment, we know the ampere-turns acting. If we plot these against time for one-half period we should get a sine wave. If we have the characteristic curve for the magnetic system giving flux against ampere turns, we can at once plot the corresponding flux wave for the half period. If the iron in the system is unsaturated, this flux curve will also be practically a sine curve, but if it is saturated it will be flat-topped. The shape of this wave will evidently be exactly the shape of the voltage wave set up by the armature, no matter what the shape of the wave of the exciting current is. Hence, if we want to generate a sine wave E.M.F., we must *not* have our iron saturated. Having plotted this flux wave we find its root mean square ordinate, and the ratio of this to the value of the constant flux of the continuous-current machine will give us the ratio of the alternating to the continuous E.M.F.—T. SQUARE.

Answer to No. 593 (*awarded* 5*s.*).—"F. C. P." requires to know what takes place when a bipolar continuous-current dynamo is excited with an alternating current, and the armature rotated at such a speed that the time for one complete revolution equals the periodic time of the exciting current. Referring to Fig. 1, while

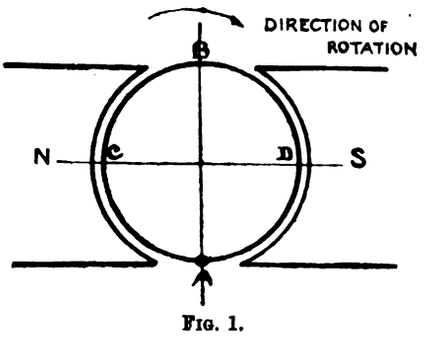


FIG. 1.

any one conductor is moving from A to B, the left-hand pole, say, will be a *north* pole and the right-hand one a *south* pole; and assuming the flux follows a sine law variation, the field will be zero when the conductor is at A and B, and at its maximum when at C. Fig. 2 represents the state of affairs during the second half of the revolution—that is, while the conductor is moving from B to A. It can be seen that in the first case the effect of the armature

Digitized by Google

revolving in the magnetic field is similar to what occurs when the machine is excited with a continuous current, the only difference being that, instead of the field being constant and a constant E.M.F. being produced, the field varies in strength and a corresponding varying voltage will be produced—in fact, the voltage will follow the same variation as the field. In the second case exactly the same thing occurs, only the polarity of the field magnets now being reversed, the E.M.F. produced due to the motion of the armature will also have reversed. So it is seen that, corresponding to one revolution of the armature, a complete alternation of the E.M.F. occurs, so that, due to the motion of the armature alone, an alternating E.M.F. is produced, being in phase with the alternating magnetic field and following the same law of variation.

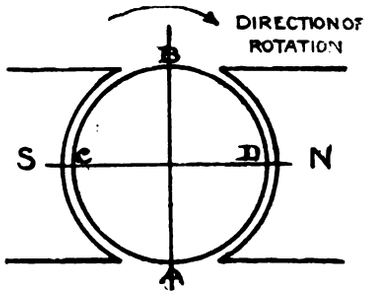

Fig. 2.

In addition to this E.M.F., however, we have that the armature is acting as the secondary of a transformer, the primary winding being the field winding. The E.M.F. induced in the armature due to this cause alone will at any instant be proportional to the rate of change of the magnetic field—that is, it will be an alternating E.M.F. passing through its zero value when the field is a maximum, and reaching a maximum value when the field passes through zero. Fig. 3 explains this Curve 1 represents the magnetic field, Curve 2 the E.M F. induced in the armature due to its motion in this field; Curve 3 the E.M.F. induced in the armature due to the alternating magnetic field. Adding Curves 2 and 3 together we obtain Curve 4, which shows the E.M.F. that would be obtained from the machine. As can be seen from this diagram, it is an alternating E.M.F.; the effect of the

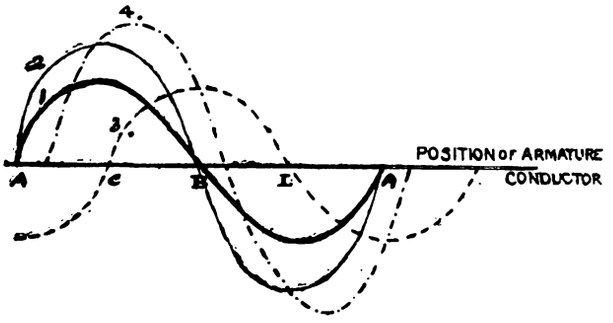

Fig. 3.

auxiliary E.M.F. represented by Curve 3 being to increase the maximum value of the resultant E.M.F., and cause a phase displacement between it and the exciting current.—A. G. YOUNG.

Answer to No. 593 (*awarded* 5*s.*).—Under such circumstances an ordinary alternating E.M.F. would be generated. It would have a periodicity equal to that of the exciting current, and its amount would depend on the flux set up, the number of conductors, and the speed. The fact that the armature rotates at synchronous speed, so that a given conductor is always moving in a field of the same polarity, does not affect the matter qualitatively, as the same result, even as regards the periodicity of the resulting E.M.F. (which would always equal that of the exciting current), would be obtained at any speed, the actual value of the E.M.F. being simply proportional to the speed and flux.

The action can be followed most simply in the case of a Gramme armature (Fig. 1), though the net result is precisely the same with a drum winding. When the armature is at rest, with the brushes set on the neutral line, no E.M.F. will be measurable between the brushes, as it is evident that the E.M.F.'s induced by the alternating flux in the parts of the winding, A to C and A to D, are opposed and cancelled by the E.M.F.'s set up in B C and B D respectively. At the same time a considerable current may be set up in the sections short-circuited under the brushes, as these sections are traversed by the full flux, and act just like the short-circuited secondary of a transformer of which the field winding is the primary. If, instead of the brushes being set on the neutral line, they are given some lead, the E.M.F.'s between A and B will no longer just cancel out, as the distribution

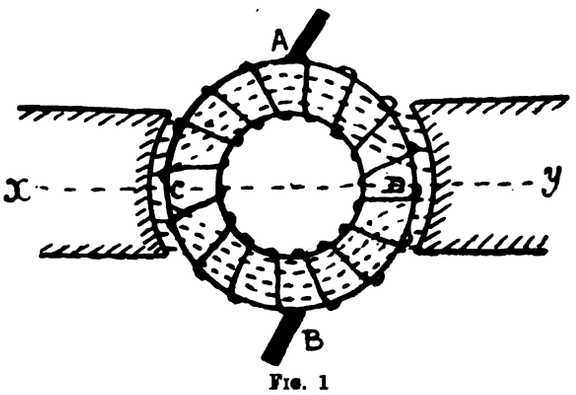

Fig. 1

of the windings between A and B is no longer exactly symmetrical about the pole axis $x\,y$ These, however, are only secondary starting effects, the former being more or less easily overcome by employing high-resistance connections to the commutator plates, and the latter by keeping the armature reaction low, and so avoiding the necessity of brush lead. As soon as the armature is rotated, a voltage will be generated whose instantaneous value is, in accordance with the fundamental dynamo equation, $E = C \times R \times N \times 2 \div 10^8$, where C = the number of conductors in series from brush to brush—*i.e.*, half the total conductors on the face of the armature in this case; R = the number of revolutions per second; N = the instantaneous value of the flux entering the armature at one pole in C.G.S. lines. When the field is excited with an alternating current, the instantaneous flux, N, has not a constant value, but varies from moment to moment, and the armature voltage, E, rises and falls in unison and changes sign every time a pole changes from a north to a south pole, or *vice versâ*, under the action of the alternating excitation.

It may be pointed out that series alternating motors having large starting torque have occasionally been constructed on this principle, the same alternating current traversing armature and field windings, and thus producing a unidirectional though intermittent torque. Such machines have not come into general use, more from practical difficulties as to sparking and low power factors than from any theoretical defect.—Q.

Question No. 594.—It is frequently stated that induction motors having short-circuited rotors can be started up with normal full-load torque, and about one and a quarter times full-load current, by means of an auto-transformer. As an auto-transformer is merely a means of supplying the motor with an impressed voltage lower than that of the line, how is it possible to do so? From the writer's experiments, it appears that whether the impressed voltage is reduced by an auto-transformer or a non-inductive resistance, the starting torque with full-load current is only one-eighth full-load torque, and in order to get full-load torque it has been necessary to get about four times the full-load current through the motor. N.B.—The question relates only to motors having so-called "squirrel-cage rotors."

Best Answer to No. 594 (*awarded* 10*s.*).—It is almost impossible to design a polyphase induction motor with reasonably efficient squirrel-cage rotor to give full-load torque at starting with as low a current as $1\frac{1}{4}$ times the normal full-load current. The usual figure for this result is four times, or at least three times, the normal full-load current. This is without the use of an auto-transformer. Auto-transformers, when used to reduce the pressure (Fig. 1), are usually employed in the case of motors starting on light pulleys or, at any rate, with very low torque, as the only effect of reducing the motor terminal pressure

Digitized by Google

is to reduce the starting torque for a given current, and at the same time reduce the value of the maximum current passing through the motor at the instant of starting when the motor behaves as a short-circuited transformer. In this way an auto-transformer increases the time taken for

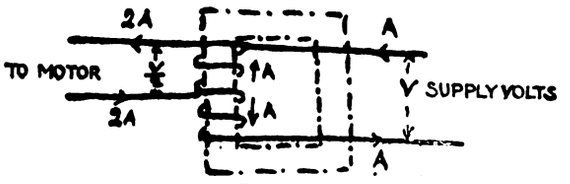

Fig. 1.

the motor to reach full speed, but also reduces the maximum current drawn from the mains.

Occasionally in the case of crane motors or railway motors, an increased starting torque is obtained by employing an auto-transformer to *raise* the pressure at starting (Fig. 2). In this way, especially if the whole iron path of

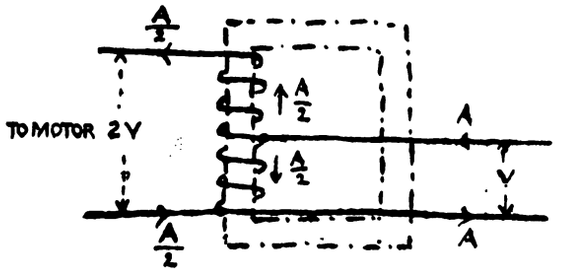

Fig. 2.

the motor is quite unsaturated at the normal voltage, it would be possible to get full-load torque with a current consumption of perhaps double the normal, and possibly this is the case referred to by the writer of the question. It will be seen from Figs. 1 and 2, which show the instantaneous current distribution on auto-transformers employed respectively to halve and to double the terminal pressure, that such transformers cannot fairly be considered as simply pressure-reducing devices, like choking coils or resistances. On the contrary, auto-transformers act as true transformers, altering the volts at the expense of the amperes, so that if, for instance, a motor input of 100 volts, 50 amperes is required from a 200-volt supply circuit the actual current drawn from the mains if an auto-transformer is used will be 25 amperes, neglecting losses, whilst if a choking coil or non-inductive resistance were used it would be 50 amperes.—Q.

Answer to No. 594 (*awarded* 5*s.*).—The claims as to the starting current of alternating-current motors are judiciously stated rather ambiguously. The statement that they will start with 1¼ times normal current means 1¼ times normal will be taken *from the mains*. "J. A." has evidently taken it to mean the current in the motor, as he speaks of reducing the voltage "by an auto-transformer or a non-inductive resistance." As far as the current in the motor is con-

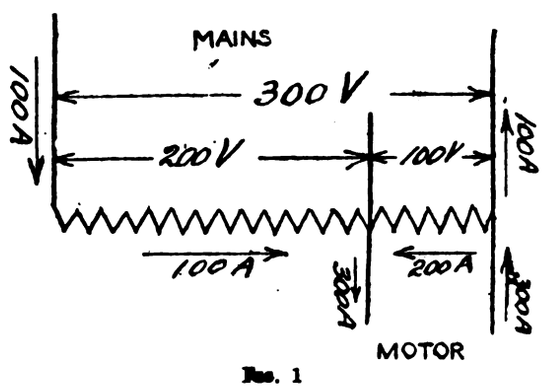

Fig. 1

cerned, there is no difference between these two methods, but as regards that in the mains there is all the difference. The transformer may be made to give one-third of the line voltage to the motor; then the motor current will be three times the line current (Fig. 1). Then with 1¼ times normal line current the motor will get 3¾ times its normal current, which is about the same as "J. A.'s" experimental value. Four times normal certainly seems a large current to put into a motor, but the armature cannot heat appreciably in the short time taken to run up to speed, and there can be no sparking troubles, which would prevent

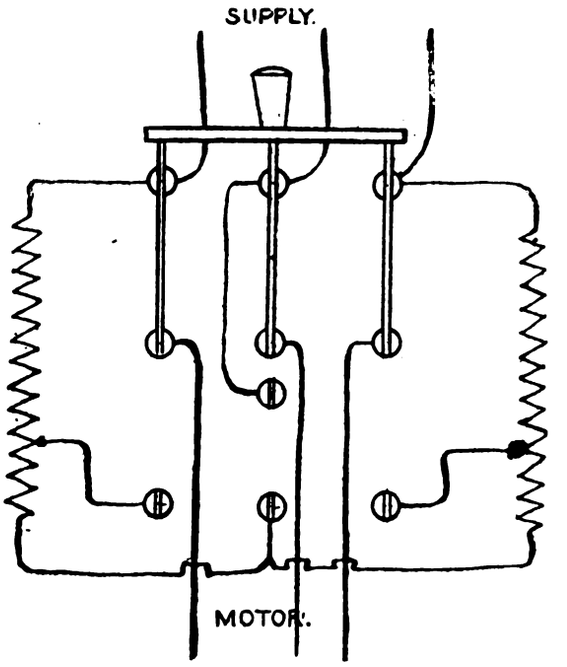

Fig. 2.

any such use of a direct-current motor. Fig. 2 shows the arrangement of two auto-transformers and a three-pole throw-over switch for starting a three-phase motor.—W.

Answer to No. 594 (*awarded* 5*s.*).—The seeming contradiction which "J. A." has experienced is due to erroneous, or, perhaps, rather incomplete ideas of the

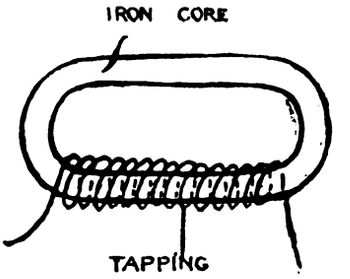

Fig. 1.

functions of an auto-transformer. An auto-transformer consists of an iron core similar to an ordinary transformer, but having only one coil wound on it (as shown diagram-

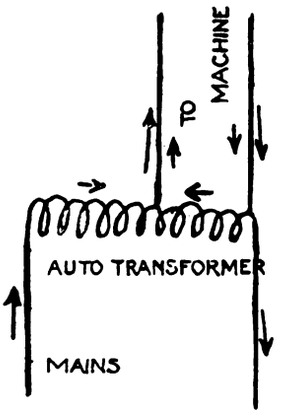

Fig. 2.

matically in Fig. 1). From some part in the winding, the position of which depends on the voltage required and the supply, voltage and tapping is brought out. The two terminals of the auto-transformer are connected to the mains, and the terminal and the tapping wire connected to machine or apparatus requiring the reduced pressure,

Digitized by Google

as in Fig. 2. The working is quite clear. The current flows through the front part of auto-transformer winding through the machine, but in passing through the auto-transformer winding it not only reduces the pressure, but sets up a magnetic field which induces a current in the second half of the winding, which flows in an opposite direction to that of the primary, as indicated by the arrows in Fig. 2, and thus the current flowing through the machine is the sum of the current from line plus the induced current. Obviously, if the tapping is in the centre of the winding, the line current and induced current will be approximately equal (neglecting the magnetising current), and the machine will receive twice the current drawn from the mains. By suitably placing the tapping point the machine can be fed with three to four times the current taken from the mains, which would be arranged to be about full-load current, and thus start up with full-load torque. Another condition might be added. An auto-transformer is designed to start a certain motor with a certain load. If it is put on to an entirely different load, good results cannot be expected.—ERG.

CABLEMAKERS' ASSOCIATION.

We have received the following circular, signed by the British Insulated and Helsby Cables, Limited, Connolly Bros., Limited, W. T. Glover and Co., Limited, W. T. Henley's Telegraph Works Company, Limited, the India Rubber, Gutta Percha, and Telegraph Works Company, Limited, the London Electric Wire Company, Limited, Siemens Bros. and Co., Limited, Callender Cable and Construction Company, Limited: The importance of using thoroughly reliable flexible cords in electric light installations is fully recognised by insurance offices and public bodies generally. Their stringent regulations on this subject show that they appreciate the danger attached to the use of inferior material. The ordinary user, however, does not appreciate the risk of fire which arises from the use of cheap flexible cords, often in situations exposed to mechanical injury and in contact with inflammable material, such as curtains, bed hangings, carpets, tablecloths, etc. The cost of the flexible cords bears such a small proportion to the total cost of an installation that on the score of economy no importance need be attached to the extra cost for a good quality. The Cablemakers' Association, as representing the principal makers of insulated wire in this country, has been asked if a cord could not be produced bearing some distinctive label which would comply with the requirements of the insurance offices and public bodies, and would ensure to consulting engineers, contractors, and others that a thoroughly reliable and safe article was being employed. The association has, therefore, arranged for the manufacture of a flexible cord to a special specification, which, though naturally rather higher in price than some of the cords now in use, will increase the total cost of an installation only to an appreciable extent. This cord is insulated with pure and vulcanised indiarubber, and gives a minimum insulation resistance of 600 megohms per mile at 60deg. F. after 24 hours' immersion in water and one minutes' electrification, and is tested with 1,000 volts alternating current for 15 minutes. This cord can be obtained from supply houses generally, or from the members of the Cablemakers' Association, whose names are subscribed, and each coil will bear a label with a registered trade mark, which consists of a shield bearing three heads of lions *plain*, who have each suspended from its mouth a ring, surcharged C, M, and A respectively.

PERSONAL.

Mr. W. T. Wardale has been appointed shift engineer at the Corporation tramways power station, Sheffield, at a salary of £120.

Mr. Llewelyn B. Atkinson, A.M.I.C.E., has recently joined the board of W. T. Glover and Co., Limited. His lengthy and varied experience with mining work will be especially valuable, now that this branch of engineering is coming more under the influence of electricity.

We understand that Mr. W. J Sowter, who is superintending the erection of the electricity works at Dorchester, will take charge of the same when completed as borough electrical engineer.

FORTHCOMING EVENTS.

Municipal Electrical Association.—July 17 and 18, concluding days of annual convention, Sunderland. July 17, Middlesbrough Corporation luncheon. (Programme appeared in our issue of the 12th ult.)

Iron and Steel Institute.—Summer meeting, Barrow-in-Furness, September 1-4.

Municipal and County Engineers.—Meetings: Widnes, July 18; Aberdeen, August 20, 21, and 22; Hastings, September 11 and 12. Detailed programmes will be issued when definite arrangements are made.

CROYDON ELECTRICITY ACCOUNTS.

From the statement of accounts for the year ended March 25 last, it is seen that the total expenditure on capital account on that date amounted to £231,343. We append abstracts of the revenue account and balance-sheet, together with statement of electricity generated, sold, etc.

REVENUE ACCOUNT.

UNIVERSITY OF MI

LONDON TRAFFIC COMMISSION.

Mr. J. W. Benn, the chairman of the Highways Committee of the London County Council, gave further evidence before the Commission which is enquiring into the question of locomotion in London at its further sitting last Friday. He began by giving some interesting figures with regard to tramway and omnibus traffic in the Metropolis, particular reference being made to the County Council's undertaking. He stated that there were 15,000 tramcars and 4,000 omnibuses running daily in London. An electric car carrying 65 passengers was only 35ft. 6in. in length, as against 35ft. 6in. of a horse and tram and 20ft. of an omnibus; 2,615 of those vehicles, against 5,500 horse vehicles, covering 16½ miles, as against 27½ miles, would be sufficient to carry the same number of passengers—viz., 170,000. There would be a saving of nearly 3,000 vehicles and a space of 10½ acres in London by the adoption of the new electric system, without any prejudice to the public service. In the south the County Council had adopted the conduit system, while in the north a tramway company leased the tramways, and they were opposed to the adoption of that system. At the present time there was a proposal before the Council showing the conduit system for the central portion of London up to the Angel, Islington, and the King's Cross terminus, and beyond that zone they had submitted proposals for the overhead system. The difficulty was that the borough councils were invested with a veto, and almost uniformly declared against the supposed disadvantages of the trolley system. The difficulties of the Council had been remarkably few, and had been overcome. They did not find any serious difficulties in regard to wet with the conduit system. The storms a fortnight ago were a severe trial, and they got through without any discomfort. The Council proposed running tramways in shallow subways under the road. They would use the conduit system in the line running from Islington, *via* Theobald's-road, dipping down under the street, and emerging, when Parliament permitted, on the Embankment. For the moment their cars would have to stop somewhere near the Strand. The figures of the working of the trams in the South of London for the last four years showed a total net profit to the ratepayers of £72,910. Last year there was a loss, after setting aside interest and sinking fund. Since electric traction had been started they were rapidly recovering their arrears, and next year promised to be a good one. In addition, the reserve fund now stood at £31,391.

In answer to further questions, the witness said that the Council desired that their powers as the local tramways authority should not come within the jurisdiction of the tribunal, the Council being recognised as the sole authority in London, and retaining its present power to promote Bills dealing with tramways without being obliged to obtain the consent of the road authorities. A resolution to that effect had been passed by the Council. They had endeavoured to co-ordinate the undertakings acquired into one comprehensive system. To allow other promoters to come into London would be simply to revert to the old system of haphazard enterprise. The Council practically only asked that it might be left in its present position. The witness, continuing, submitted that the borough councils should have the fullest right to be heard before any authority before whom it might be determined that the Council should promote tramway schemes, but a scheme should be heard on its merits, and not be subject to the uncontrolled veto of the metropolitan borough councils. From the Council's experience of the working of the conduit and overhead systems he estimated that the cost of the former was 33 per cent. greater than the latter, but the durability was much greater. With regard to the leasing of the northern lines to the North Metropolitan Tramways Company, the profits to the Council had been reduced by over £10,000 a year owing to the company's having sold their lines which were outside the London county area, a proportion of the receipts of which the Council had taken before the sale.

Mr Samuel George Burgess, housing manager of the London County Council, then gave evidence with regard to the question of overcrowding. The electrification of the South London tramways would no doubt induce people to move out from Southwark and Lambeth to Tooting. The solution of the difficulty with regard to the working classes would be found in opening up new districts with cheap and quick means of communication.

The Commission adjourned.

LEGAL INTELLIGENCE.

CHARING CROSS AND HAMPSTEAD TUBE.

In the King's Bench Division of the High Court on Tuesday, Mr. Henry Herbert Montague Smith sued the Charing Cross, Euston, and Hampstead Railway Company for £4,000 salary as secretary since 1897.

It appeared that the plaintiff had been engaged for a very considerable time in assisting in the formation of tube railways. In 1893 he was employed, at £800 per annum, as manager and secretary of the Charing Cross, Euston, and Hampstead Railway. The original intention was to raise the capital by issuing a prospectus, but this was found to be unsatisfactory, and plaintiff went to America to enter into negotiations with Mr. Yerkes to provide the capital. Mr. Smith was employed under an agreement setting forth that he was to receive no salary until the first public allotment of shares was made, when he was to be paid all arrears. If there was no public allotment he was to receive no remuneration. This agreement was to hold good for a period of three years after the railway was opened for traffic. He was paid his salary up to Oct. 30, 1897, on which date he was dismissed, and it was for subsequent salary that the plantiff was now suing

Mr. R. W. Perks, M.P., solicitor to the company, said that the agreement by which Mr. Smith was to receive £800 a year was terminated long since. He regarded the services rendered by the plaintiff as being worth only £150 or £200 a year.

His Lordship said that in his mind there had been no public allotment, so that no salary was due to the plaintiff. There had, however, been wrongful dismissal, for which he considered the plaintiff was entitled to recover 40s. as compensation, each side paying its own costs.

ACTION FOR LIBEL.

A libel action arising out of the series of articles that appeared in the *Daily News* at the end of last year on the subject of municipal trading was heard before Mr. Justice Lawrance and a special jury in the King's Bench Division of the High Court of Justice this week. The plaintiff was Mr S. P. W. D'Alte Sellor, engineer to the British Electric Traction Company, and he sued the proprietors of the *Daily News* to recover damages for alleged libel. The defendant company pleaded that there was no libel, denied the innuendoes placed on the words by the plaintiff, and justified the words used.

Mr. Gill, K.C., for the plaintiff, said that his client was retained by the British Electric Traction Company as their engineer for the purpose of advising them at a salary of £1,500 a year, being left free to carry on his private business as well. In November last the *Daily News* published an article discussing the question of municipal trading. It was called "The Development of the Electrical Trust," and, said counsel, was really an attack on the British Electric Traction Company, which did a very large business in various parts of the country. Plaintiff complained that the headings and sub-headings of the article ostensibly connected him with Jabez Spencer Balfour and Henry Granville Wright, and that the writer then proceeded to comment on the fact that plaintiff served on Mr. Bryce's Light Railway Commission, that he was a member of numerous societies, and consulting engineer to several corporations and tramway companies, besides being a paid servant of the Electric Traction Company in a manner which, having regard to what had gone before, reflected discreditably on him and imputed professional misconduct.

The **Plaintiff** was called, and in cross-examination said that the *Daily News* article was one of a series in answer to the articles in the *Times* on "Municipal Socialism." He could not point out any statement of fact in the article which was untrue. He had dictated or edited the autobiography from which the "two facts" with regard to himself had been taken. It was the comments of which he complained.

Mr. Gill asked the jury to give damages which would mark their disapproval of this kind of journalism.

Mr. Rufus Isaacs, for the defence, declared that there was not the remotest intention on the part of the defendants to reflect on the plaintiff's character or professional conduct. The article was an attack on the British Electric Traction Company, and Mr. Sellon, who played only a very unimportant part in the controversy, had not suffered the slightest damage. The *Daily News* or anybody else was, he submitted, entitled to comment fearlessly, independently, and boldly.

Mr. Justice Lawrance said the question the jury had to consider was whether the *Daily News* had exercised the right of the Press to use strong language, so long as it was honestly used, on a matter of public interest, or had gone out of its way to attack the private character of the plaintiff.

The jury found for the plaintiff, and awarded him one farthing damages.

Mr. Justice Lawrance having left the court before the jury returned, judgment was not entered.

ALLEGED UNSATISFACTORY TELEPHONE.

At the Marylebone County Court on Monday, before Deputy-Judge Fitzroy Cowper and a jury, the National Telephone Company brought an action against Mr. Henry Samuel, 11, Cleveland-square, Hyde Park, W., and Basildon House, Moorgate-street, E.C., claiming £10. 11s. 8d. in respect of the rent of a telephone.

Plaintiff's counsel stated that in January, 1900, the defendant entered into an agreement with the plaintiff company for the latter to supply a telephone with telephonic communication with other subscribers. The agreement was for five years, the defendant undertaking to pay £10. 5s. annually in advance. According to the terms of the agreement, the company were to maintain the telephone in good working order. When defendant's subscription became due in January last he declined to pay, and on March 6 the defendant was disconnected. The defence was that the telephonic communication was so ineffective that the defendant ought to be released from his agreement.

The jury returned a verdict to the effect that the telephone in question had not worked reasonably well, the Foreman remarking that they considered it was radically wrong.

His Honour accordingly gave judgment for the defendant with costs, and made an order for the recision of the five years' agreement.

Counsel for the plaintiff company intimated that there would probably be an appeal.

WHAT IS ENGINEERING WORK?

A novel issue under the Workmen's Compensation Act came before Judge Williams on Wednesday at Pontypridd County Court. The applicant for compensation sustained injury whilst doing duty on a steam-roller used to level roads, which had been disturbed by the respondents, Callender's Cable and Construction Company, who were contractors for the Electric Power Distribution Company. The contention of respondents was that this case did not come within the purview of the Act; that it was not engineering or kindred work in any sense. The Judge, however, decided for the claimant, and made an award for 13s. 5d. a week to be paid to the workman during incapacity.

COMPANIES' MEETINGS AND REPORTS.

TELEGRAPH CONSTRUCTION AND MAINTENANCE.

The half-yearly meeting of the shareholders in this Company was held on the 14th inst. at the offices, Old Broad-street, Sir R. G. W. Herbert presiding.

The **Chairman** reminded the shareholders that they were on that occasion holding only their half-yearly meeting, at which no accounts were presented. Since their last meeting the second of the Company's great cable constructions across the Pacific had been completed—that which had been carried out by them for the Commercial Company from Honolulu to Manila. This considerable work was completed by them, to the great satisfaction of the Government and people of the United States, on their Independence Day, the 4th inst., and the directors were glad to know that, as far as they had heard, the cable was quite equal in its character and performances to those which the Company had laid to other places. It was about 5,800 knots, so it was a very considerable work, and on completing it they had brought up their record since the formation of the Company to no less than 175,000 miles of deep-sea cable and to as much as 200,000 knots of insulated guttapercha-covered wires for submarine telegraph purposes. This was really a very remarkable record. The works were in very good order, and there was an amount of work in hand which would carry them on through a considerable part of the current year. He thought it might be said that the prospects of cable construction generally were not bad, although perhaps there was nothing of any very great importance to be dealt with immediately. There seemed, however, to be a tendency to have more and more direct cable communication between different ports and points, and the directors felt that the prospects of the industry were not at all interfered with by the aerial telegraph system, inasmuch as the conviction seemed to be growing stronger that that system could not compete with cables on a commercial basis, or at long distances more particularly. It might have been observed that the shares of cable companies had risen very materially from the low quotations to which they fell, and on the whole he thought that the prospects of submarine telegraphy were quite good. He expressed his readiness to give any further information which the shareholders might require, but reminded them that the directors had no resolution to submit on that occasion. No question, however, was asked by any shareholder, and the proceedings terminated with the chairman's statement.

ELECTRICAL POWER STORAGE.

Presiding over the ordinary general meeting at the offices, Great Winchester-street, on the 9th inst., **Mr. J. Irving Courtenay**, in moving the adoption of the report (which appeared in our issue of the 3rd inst.), said the steady improvement in the business justified them in recommending an increase of 1 per cent. in the dividend, making it 6 per cent., while again transferring £5,000 to the reserve fund and £1,000 to the contingent fund. In addition to their usual business in smaller batteries for lighting and traction, they had completed during the year under review more than 20 large installations in connection with lighting and power stations in various parts of the kingdom, and they had in course of erection or on their books at the beginning of the year orders for 13 similar installations. They therefore commenced the year with their order-book well filled, and it was gratifying to know that in every department the works were fully employed. The new Carzonode plate had created considerable interest, and was achieving most satisfactory results wherever it had been used. The Company had had a very large sale for batteries for propelling electric carriages, and in this connection they had been steadily continuing experiments with the Company's own vehicles, and thus collecting a mass of valuable statistics. The competition had been quite as severe as in previous years, and they had also had an American invasion, as the largest storage battery company on the other side of the water had acquired the controlling interest in one of the competing companies in this country. They were quite alive to the possibilities of further competition, but they were well prepared to meet it if necessary. There was no fresh fact connected with Mr. Edison's battery which would tend to modify the opinion the directors formed of it when it was first brought out, and the opinion in America was similar to that held by themselves—that it was no nearer to being a commercial battery than it was three years ago. The directors had full confidence in the stability and prospects of the Company's business.

Mr. Frederick Green seconded the motion, which was carried *nem. con.*

ELECTRIC CONSTRUCTION.

The annual general meeting of the shareholders in this Company was held on the 9th inst. at Winchester House, E.C., Mr. J. W. Barclay presiding.

The **Chairman**, in moving the adoption of the report (*vide* issue of 3rd inst.), said that, considering the conditions of the business during the past year, the results submitted in the accounts before them were satisfactory. The net profit of £20,737 compared favourably with that of last year, and enabled them to recommend the same dividends and appropriations, while a larger amount was carried forward. Referring to the suggested new fiscal policy and its probable effect on their business, he considered they had passed through as severe a struggle with foreign competitors as they might reasonably expect to have to encounter in the future. The Germans had pushed hard, and secured orders from some corporations who preferred the cheapness of goods made in Germany to the higher quality of British manufactures; but the Germans had made no profit on their business in this country. It was not prosperity that had sent them to this country, but the depression that had now for some years prevailed in Germany. They considered their loss would be less in selling at unremunerative prices in this country than to allow their works to stand idle. When they had better trade at home, and when their factories, unhealthily stimulated by their protective policy, had been eliminated, we should have little to fear from German competition. Again, the American manufacturers did not seem to find much advantage from protection; for although, as they were frequently told, they had unbounded natural resources at home, two of the largest companies had come across and established works in this country. No protective tariff would help them against that competition. In his opinion, our industries had suffered more from legislative interference and restrictions, and from the mistaken notions of those who thought they were furthering the interests of the working-men, than from foreign competition. A recent case in point would illustrate this statement. The London County Council the other day resolved to accept the cheapest tenders for their work, whether from home or foreign manufacturers. The London County Council stipulated that every contractor should observe the trade union rates of wages and hours, and that the rates of wages should be published publicly in the workshops. Those conditions were enforced against manufacturers in this country, but they were not and could not be enforced against the foreign contractor. The conditions were presumably intended to prevent sweating by employers, but the result to our artisans was that work they should naturally have goes out of the country, because the interference between employers and their workmen tended to raise friction and dispeace in the factory, which employers strove to avoid, and indirectly added considerably to the cost and risk of manufacturing. He did not like foreign competition, but he did not believe that the doom of our manufacturing interests was to come by foreign competition.

Mr. P. E. Beachcroft seconded the motion, and it was unanimously adopted.

NATIONAL TELEPHONE.

The report of the directors for the half-year ended June 30 last states that the income accrued in respect of the business of the half-year amounts to £894,047, as compared with £823,243 for the corresponding period of 1902, being an increase of £70,803. Working expenses for the half-year amount to £516,052, as compared with £478,032 for the corresponding period of 1902, being an increase of £38,020. The net result for the half-year (after deducting the Post Office royalties amounting to £81,930) is a profit of £296,064, as compared with £269,445 for the corresponding period of 1902, being an increase of £26,619. The rentals carried forward for unexpired terms of running contracts amount to £874,383, as compared with £821,397 at the corresponding period of 1902, being an increase of £52,985. Out of the available balance of £239,748 the Board recommends the payment for the half-year of a dividend at the rate of 6 per cent. per annum on the first and second preference shares, 5 per cent. per annum on the third preference shares, 6 per cent. per annum on the preferred stock, and 5 per cent. per annum on the deferred stock; to transfer £85,000 to reserve fund, carrying forward £5,831. The sum of £334,116 has been expended on capital account during the half-year in the erection of 14,606 additional exchange and private stations and in the construction of underground works.

NEW COMPANIES REGISTERED.

Bridge Accumulator Syndicate, Limited.—Capital, £1,000, in £1 shares. Object: to carry on the business of manufacturers of accumulators for dynamos, engines, and motors under the new "Bridge" process.

Portpatrick Electric Supply Company, Limited.—Registered in Edinburgh. Capital, £2,000. Object: to carry on the business of suppliers of electricity in all its branches. Registered office: Dunskey Estates Office, Portpatrick.

London General Automobile Company, Limited. — Capital, £10,750. Object: to carry on the business of builders and proprietors of automobiles, motorcars, engines, and carriages, whether propelled by electricity or other power.

Ozone Generators, Limited.—Capital, £6,000. Objects: to adopt a contract between E. Coustau and H. Diamant and to carry on the business of manufacturers and sellers of a gas generally known as "ozone," either by means of an electrical apparatus or otherwise. Registered office: 29-30, King-street, E.C.

Uddingston District Electric Lighting Company, Limited. — Capital, £1,000. Object: to carry on in Bothwell, county Lanark, the business of electricians, mechanical engineers, and suppliers of electric light in all its branches. Registered without articles of association. Registered office: 83, Cannon-street, E.C.

Hyde Electrical Manfacturing Company, Limited.—Capital, £5,000. Objects: to acquire the business of electrical and mechanical engineers carried on at Hyde, Cheshire, as the Pollard Electrical Engineering Company, Limited, and to carry on the business of electrical engineers, electricians, and suppliers of electric light, heat, and power. Registered office: Mary-street, Hyde.

Glamorgan Engineering Company, Limited.—Capital, £16,000. Objects: to acquire and carry on the business of electrical and mechanical engineers (but not of metal merchants, machinery brokers, and licensed valuers) carried on by C. E. and H. M. Peel, Limited, at Swansea and elsewhere, and to adopt an agreement with the said company, C. T. Peel, H. M. Peel, and A. L. Furneaux. Registered office: Glamorgan Engineering Works, Upper Strand, Swansea.

APPOINTMENTS VACANT.

Clerk of Works, London County Council Tramways, 3 to 3½ guineas per week, July 22.

Assistant Electrical Engineer, Corporation of Torquay, £150 per annum, July 20.

Assistant to Electrical Engineer, Bray Urban District Council, £80 per annum, Aug. 4.

Engineer - in - Charge, Electricity Department, Borough of Bermondsey, £104 per annum. See advertisement.

Electric Lighting Superintendent, Electricity Works, 27, Osborn-street, Whitechapel, E., July 20. See advertisement in last issue.

Assistant Superintendent, Indian Telegraph Department, Rs.4,200 a year. Apply, Secretary, Judicial and Public Department, India Office, Whitehall, London, S.W., Aug. 1. See advertisement.

Two Skilled Cable Jointers, Durban Municipality, 15s. a day. Applications, by letter, to be sent to Z.X.Y.Z., care of Deacon's Advertising Offices, Leadenhall-street, London, E.C., by July 27. See advertisement in last issue.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Hammersmith.—The Borough Council require tenders for circulating pumps, motor pipework, and accessories by July 21.

Birkenhead.—The Corporation require tenders for one 350-kw. direct-current high-speed steam dynamo. Tenders by July 28.

Beszterczebanya, Neusohl (Austria).—The Municipality require tenders for the construction of an electricity station and plant of about 600 h.p. Tenders by Aug. 1.

London, S.W.—The London County Council invite tenders for switchboards. Particulars may be obtained at the County Hall, Spring-gardens, S.W. Tenders by Aug. 11.

Stepney.—The Electrical Committee of the Borough Council invite tenders for the supply of feed, suction, and other pipework, water-softening plant, and storage tanks. Tenders by July 21.

Sheffield.—The Electric Light Committee invite tenders for various electricity meters. Particulars may be obtained from Mr. S. E. Fedden, general manager and engineer. Tenders by July 21. See advertisement in last issue.

Pietermaritzburg.—The Corporation invite tenders for the supply of electric tramcars. Particulars may be obtained from Messrs. Mordey and Dawbarn, 82, Victoria-street, London, S.W. Tenders by July 29.

Colchester.—The Tramways Committee invite tenders for the erection of a tramcar shed, consisting chiefly of iron and steel. Particulars may be obtained upon application at the Surveyor's Office. Tenders by July 28.

Pointe-a-Pitre (Guadeloupe).—The Municipality invite offers for a concession for public and private electric lighting for 15 years. Tenders by Aug. 29. Particulars may be obtained from the Colonial Office, Paris.

Hapton.—Tenders are invited for lighting the township with electricity. Particulars may be obtained from Mr. Edward O'Shaughnessy, clerk to the Hapton Parish Council, 16, Hamilton-terrace, Padiham. Tenders by July 31.

Lisbon.—The Public Works Department require tenders for the construction of 1m. gauge light railways as follows: (1) Limatal, Vianna-Ponte de Barca; (2) Oberer Minho, Braga-Monçao; (3) Braga-Guimaraes. Tenders by Aug. 1.

Atherton.—The Urban District Council invite tenders for the supply and delivery of electricity meters. Particulars may be obtained from Mr. D. Schofield, clerk to the Council, Town Hall. Tenders by July 28. See advertisement.

Rochdale.—The Corporation invite tenders for the supply and delivery of copper tramway rail bonds. Particulars may be obtained from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster. Tenders by 28th inst. See advertisement.

Blackburn.—The Town Council invite tenders for one complete main switchboard and accessories. Particulars may be obtained from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster. Tenders by July 27. See advertisement in last issue.

Chelsea.—The Borough Council invite tenders for the installation of the electric light in the lower hall of the town hall buildings. Particulars may be obtained at the office of the Borough Surveyor, Town Hall. Tenders by July 22. See advertisement.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Manchester.—The Paving, Sewering, and Highways Committee invite tenders for laying underground telephone pipes, with other appurtenant works. Particulars may be obtained on application at the City Surveyor's Office, Town Hall, Manchester. Tenders by July 20.

Swindon.—The Corporation invite tenders for seven electric tramcars, with all trucks, motors, and accessories. Particulars may be obtained from Messrs. Lacey and Sillar, 78, King-street, Manchester, and 2, Queen Anne's-gate, Westminster. Tenders by July 23. See advertisement in last issue.

Gloucester.—Tenders have been accepted by the Corporation for electrical work from the General Electric Company, Statter and Co., Crompton and Co., G. Law, British Electrical Equipment Company, J. G. White and Co., Brush Company, and Dick, Kerr, and Co. Fuller particulars in our next issue.

Heston and Isleworth.—The Urban District Council invite tenders for the supply of steam-engines, dynamos, boosters, etc., storage batteries, cables, and arc lamps and glow lamps. Particulars may be obtained from the Council's engineers, Messrs. J. and J. S. Enright, 47, Victoria-street, S.W. Tenders by 23rd inst.

Preston.—The Corporation invite tenders for the supply and erection of economisers, feed-water heaters, electrically and steam driven pumps, and overhead travelling crane. Particulars may be obtained from Mr. Walter H. Tittensor, consulting and resident electrical engineer, 25, Burrow-road, Preston. Tenders by July 22.

Launceston (Tasmania).—The Mayor and Aldermen invite tenders for the supply of 500 or more electric meters. Particulars may be obtained on application to Mr. William Corin, city electrical engineer, Launceston, Tasmania, or to Messrs. John Terry and Co., 7, Great Winchester-street, London, E.C. Tenders by Sept. 28.

Aldershot.—The Urban District Council invite tenders for the supply and erection at the sewage works of two 4in. motor-driven centrifugal pumps; also generator, battery, and automatic starting switches. Particulars may be obtained at the office of the Engineer and Surveyor to the Council. Tenders by Aug. 4. See advertisement.

Wednesbury.—The Corporation invite offers from firms willing to undertake free and hire-purchase electric wiring and motors within the borough. Full particulars may be obtained from Mr. F. J. Warden-Stevens, the consulting engineer to the Corporation, 34, Victoria-street, Westminster. Tenders by July 30. See advertisement.

Bath.—The Corporation invite tenders for the supply and erection of a main switchboard at the new generating station. Particulars may be obtained from Messrs. Kincaid, Waller, Manville, and Dawson, 29, Great George-street, Westminster, or at the City Electrical Engineer's Office, 7, Dorchester-street, Bath. Tenders by 27th inst. See advertisement.

Cheadle (Cheshire).—The Urban District Council invite tenders for the supply and delivery of about 350 tons of grooved steel girder tramway rails, eight tons of tie-bars, 13½ tons of fishplates, and three tons of bolts and nuts; also for 17 sets of points and crossings. Particulars may be obtained from Mr. Charles R. Brady, A.M.I.C.E., 13, Warren-street, Stockport. Tenders by July 27.

Madrid.—The Posts and Telegraphs Department require tenders for the supply of 25 telegraph apparatus of the Hughes system and 25 motors with weight elevators for the same, for the service of the telegraph stations of the State, at the upset price of 2,530 pesetas, or about £73, for each apparatus with its accessories as detailed, and 408 pesetas, or about £12, for each motor with its corresponding elevator.

RESULTS OF TENDERS.

Houghton. — The contract for laying down the rails for the tramways has been let to Messrs. Krauss and Co., Limited, of Bristol and Germany.

Gloucester.—The Corporation have accepted the tender of J. G. White and Co., Limited, for the supply of poles and mountings for the tramways, at £4,381. 5s.

London County Council.—The Council have placed a contract for lamps (British made), high and low voltage, with Mackey's Electric Lamp Company, Limited.

Dewsbury.—The Electricity Committee recommend that the tender of Messrs. J. and J. Horsfield, Dewsbury, be accepted for the supply, delivery, and erection of one Lancashire boiler.

Kettering.—The Urban District Council have accepted the tender of the Electrical Power Storage Company, Limited, 4, Great Winchester-street, London, E.C., for a storage battery.

Colchester.—The Corporation have accepted the tender of J. G. White and Co., Limited, for complete construction of the tramways—permanent way, overhead equipment, and cables—at £35,039. 8s.

Manchester.—The Corporation have accepted the tender of Messrs. Rowland Carr and Co. for the supply of box compound for the whole of their requirements for the electrical department for the next 12 months.

Derby.—The Corporation have accepted the tender of J. G. White and Co., Limited, for complete construction of the tramways—permanent way, overhead equipment, cables, cars, and equipments—at £87,627. 10s.

Gibraltar.—The sub-contract for the storage battery has been placed by the Electric Construction Company, Limited, of London and Wolverhampton, with the Electrical Power Storage Company, Limited, 4, Great Winchester-street, London, E.C.

Devenport.—The sub-contract for the storage battery has been placed by the British Westinghouse Electric and Manufacturing Company, Limited, of London and Manchester, with the Electrical Power Storage Company, Limited, of 4, Great Winchester-street, E.C.

Littleborough.—The Urban District Council have accepted the tender of the Rochdale Electric Company, Limited, for the complete electrical equipment of their new supply station, together with the wiring of the Carnegie library, municipal offices, new Board schools, etc.

Stepney.—The Borough Council has accepted the following tenders: Johnson and Phillips, Victoria Works, Old Charlton, carbons, £263 13s. 6d.; Reason Manufacturing Company, Limited, Lewes-road, Brighton, meters up to 10 amperes and demand indicators; Ferranti Limited, Hollinwood, Lancashire, meters above 10 amperes.

Digitized by Google

Aston.—The Town Council have accepted the following tenders: British Thomson-Houston Company, Manchester, tramway feeder cables; Naylor Bros., Golborne, side bracket arms with mild-steel pressed clamps; Tramways Electrical Equipment Company, section insulators; Lancashire Electrical Engineering Company, wiring, etc., the car-shed.

Brighton.—The tender of the British Westinghouse Electric and Manufacturing Company has been accepted for the supply and erection of generating plant at the Southwick power station and motor-generator converting plant, together with switchboards, instruments, etc., at the North-road power station, including maintenance for 12 months, at £79,846, with an addition of £580 for electrically-driven condensers, subject to a set of drawings being submitted.

BUSINESS NOTES.

TRACTION.

Swindon.—The tramway tracks are to be lighted by arc lamps.

Dublin.—A scheme is on foot for a tramway from Dublin to Slane.

Dartmouth.—The Corporation have agreed to support the South Hams Light Railway scheme.

Coatbridge.—The Town Council have approved plans of the overhead equipment for the tramways.

Burnley.—Major Druitt has inspected the Accrington-road branch line, and it is now in full operation.

North Ormesby.—The Imperial Tramways Company are desirous of promoting a tramway scheme in this district.

Chester.—Residents at Great Boughton are agitating for an extension of the city tramway system to their district.

Kirkcaldy.—The Town Council have agreed to borrow a further sum of £20,000 for the purpose of tramway extensions.

Leicester.—The work of constructing the new tramways in the West End and Highfields districts has been commenced.

Reading.—Several successful trial trips have been made on the new electric tramways preparatory to the opening on the 22nd inst.

Dundee.—Heads of agreement have been drawn up with reference to the proposal to construct an electric tramway to Broughty Ferry.

Yarmouth.—The Corporation propose to apply forthwith for power to carry out several important tramway extensions at an estimated cost of £44,400.

Barrowford.—The first section of the light railway—that between Newbridge and Higherford—has been inspected by Major Druitt and opened for traffic.

Wandsworth.—The London County Council's proposal to adopt the overhead trolley system for the tramway in Garratt-lane has been negatived by the Borough Council.

Islington.—The Borough Council have decided to inform the County Council of their opinion that the conduit system of traction alone should be adopted throughout the borough.

Cheadle and Gatley.—The Board of Trade have sanctioned the borrowing of £19,740 for the purpose of tramway construction in the Council's district from Cheadle Heath to Gatley.

Ashton.—The tramways manager has been instructed to have a consultation with the engineer to the Stalybridge Joint Board relative to a temporary service of cars between the two places.

Bradford.—At Tuesday's meeting of the Bradford City Council the Tramways Committee recommended the acceptance of the offer of the Shelf Tramway Company, Limited, to sell their undertaking for £1,875, and £75 costs.

Huddersfield.—At the last meeting of the Tramways Committee the borough treasurer presented a statement showing that for the year ended June 30 the receipts were £16,749. 16s. 5d., and the expenditure £18,485. 13s. 3d., leaving a deficiency of £1,735. 16s. 10d.

Wednesbury.—It has been agreed to lease the tramways within the borough to the South Staffs Tramways Company for 30 years. The first line to be equipped for electrical working will probably be that between Wednesbury and the West Bromwich boundary.

South Bank.—The District Council have agreed that no further negotiations be entered into with the electric tramways company, seeing that the Council had an alternative scheme on foot with the Middlesbrough Corporation and North Ormesby District Council.

North Metropolitan Tramways—The directors recommend for the half-year ended June 30 last a dividend at the rate of 2½ per cent. per annum, carrying forward about £400. During the half-year the number of miles run were 7,318,017 and passengers carried 70,701,915.

Lowestoft.—The opening of the new tramway system, which was to have taken place on Saturday, has had to be postponed, as the Board of Trade officials cannot make the inspection till the 21st inst. The full service will run on the 22nd, and the formal opening will be on the 25th inst.

Heywood.—The negotiations for taking over the tramways are proceeding slowly. The differences in the valuation of the lines, etc., between the company's valuer and the valuer appointed by the various local authorities are so large that it is thought it will be necessary to resort to arbitration.

Flint.—Both the Flint Corporation and the Holywell Urban District Council have agreed to support the application of a company for parliamentary powers to construct an electric tramway running from Sandycroft along the shore to Bagilt, and thence up to Holywell, and on to Mold, Buckley, and Hawarden.

Cheltenham.—Messrs. Dodd and Dodd, civil engineers, Birmingham, have received instructions from the Cheltenham and District Light Railway Company to prepare all necessary plans to enable the light railway company to construct the authorised extensions to Charlton Kings and Leckhampton.

Rochdale.—The Town Council have sealed an agreement between the Bury, Rochdale, and Oldham Tramways Company, Limited, and the Corporations of Bury, Rochdale, and Heywood, and others for the transfer of the undertaking of the company and for carrying on the tramways until completion of the purchase.

Mid-Yorkshire.—The Mid-Yorkshire Tramways Bill, which has already been passed by the House of Lords, came last week before the examiners of the House of Commons, who certified that the further Standing Orders had been duly complied with. The Bill will, in the usual course, be reported for second reading.

Worcester.—The liquidator of the Worcester Tramways, Limited, has given notice that an application will be made to the Board of Trade to extend the time for the completion of the tramways from Aug. 9, 1903, to Feb. 9, 1904. The matter has been referred to the Streets Committee of the City Council to take action.

Dudley and Stourbridge Tramways.—The Bill to empower the Dudley, Stourbridge, and District Traction Company to work their tramways by electricity has passed through Committee of the House of Commons without opposition. The Bill, which has already passed the House of Lords, has been reported for third reading.

Pemberton.—The electrical engineer has reported that everything is now in order for the commencing of work of overhead equipment in Ormskirk-road, the British Insulated Wire Company, Limited, having been notified of the acceptance of their tender, and the overhead equipment will be started in the course of a month.

Electric Traction for Lucknow.—*Indian Engineering* states that an application has been made by Messrs. Crompton and Co., London, to the Provincial Government to supply Lucknow with electric traction. If sanction is given, the Municipality will probably introduce a system of electric lighting, and thus supply a much-needed want.

Camberwell.—Yesterday a conference between the Highways Committee and the Improvements Committee of the London County Council and representatives from the Camberwell Council was held in reference to this Council's proposed extension of the tramways from Lordship-lane to Forest-hill and from Goose-green to Stuart-road, The Newlands.

Leeds.—An accident occurred on the electric tramways last Friday, involving personal injuries to three passengers and considerable damage to the car. When going down a hill the trolley left the line, and swinging to the side of the road, caught one of the brackets. The sudden wrench tore the standard on the car from its fastenings, and in falling injured three outside passengers.

London and North-Western Railway.—A correspondent states that the London and North-Western Railway Company have decided upon a scheme for the electrification of the Newport Pagnell branch line, which leaves the main through route to the north of Wolverton, where the company's extensive wagon works are located. The branch is four miles in length, with two intermediate stations.

Blackpool, St. Annes, and Lytham.—The effect of electrically equipping the Blackpool, St. Annes, and Lytham tramway has been to more than double the receipts of last year, when the gas cars were running. For the week ending July 9 the receipts were £513. 2s., as against £202. 14s. 5d. the same week last year, and the totals from May 30 to July 9 are respectively £2,957. 0s. 1d. and £1,223. 5s. 9d.

Portsmouth.—An unfortunate breakdown on the electric tramway system, involving the suspension of traffic on several routes, took place on Tuesday last week. The mishap occurred when the cars were carrying large numbers to the beach to witness the illumination of the Channel Fleet, and the loss was consequently heavy. The mishap is attributed to the failure of a line tap. Traffic was suspended for about two hours.

Ince.—After a lively debate the following resolution was adopted at the last meeting of the District Council: "That the purchase of that portion of the Wigan and Hindley tramways situate in Higher Ince be made without any arrangement as to the future leasing of the same to the Wigan Corporation, unless the proposal or scheme to include Ince within the borough be withdrawn by the Wigan Corporation.

Sutton Coldfield.—The Bill promoted by the Corporation of Sutton Coldfield with the object of authorising them to construct tramways and to carry out a variety of improvements for the benefit of their town has been before the Police and Sanitary Regulations Committee of the House of Commons, presided over by Mr. Heywood Johnstone. So far as it related to the proposed tramways, the Committee found the preamble not proved.

Brighton.—The Lords Committee, having authorised all the proposed extensions to the tramways except that of the Montpelier-road route, have now dealt with the gas company's opposition, and granted a clause protecting the company's mains on new routes only. The gas company also opposed the application for powers to supply electricity outside the borough at a loss. Other portions of the Bill were unopposed, and with provisions specified the preamble was passed.

City and South London Railway.—The accounts of this railway for the half-year ended June 30 last show a balance, after providing for the debenture stock interest, dividend on the preference stocks, and transfer to the renewal fund of £1,500, sufficient to allow a dividend on the consolidated ordinary stock for the half-year at the rate of 2¾ per cent. per annum, carrying forward £1,500. The dividend for the corresponding period last year was at the rate of 3 per cent. per annum, carrying forward £1,750.

Digitized by Google

Sunderland.—The Tramways Committee have referred back to the Traffic Sub-Committee a resolution prohibiting passengers from carrying with them more luggage than can be held upon the knee, unless such parcels be placed on the motorman's platform and charged for. The Electricity Committee have decided to offer the Tramways Committee a reduction from 2d. to 1½d. per unit, to take effect from April 1 last and to continue till March 31, 1904, when the question of a further reduction will be considered.

Blackwall Tunnel.—The General Purposes Committee of the Poplar Borough Council on Wednesday reported that they had considered the proposals of the London County Council to construct a tramway from Greenwich to Poplar through the Blackwall Tunnel, and recommended that consent should be withheld. It will be remembered the proposal was brought forward in the parliamentary Bill of 1903, but owing to the opposition of the Greenwich and Poplar Borough Councils, had to be withdrawn.

Leigh.—At the last meeting of the Town Council it was reported that under the South Lancashire Tramways Act, 1900, the South Lancashire Tramways Company were compelled to furnish the Corporation with a free supply of electricity for the lighting of those streets within the borough within which their tramways were laid. The committee recommended that the chief thoroughfare should be lighted with electric arc lamps, and also that all the borough gas lamps be fitted with incandescent burners. The recommendations were approved.

Liverpool and Yorkshire Railway.—A newspaper report says that rapid progress is being made by Messrs. Dick, Kerr, and Co. with the electrification of the Lancashire and Yorkshire Railway between Liverpool and Southport. A start was made early in the present year, and the work, it is fully expected, will be completed within the next few months, so as to allow the opening of the line on Jan. 1, 1904. The Liverpool and Yorkshire officials are, says the report, loud in their praise of the progress so far made with the contract by Messrs. Dick, Kerr, and Co.

New South Wales.—English manufacturers of heavy electrical machinery will be interested to learn that the Railway Commissioners of New South Wales are inviting offers for additional machinery for the traction power-house at Ultimo. Tenders are to be received by Sept. 12. It is deemed necessary to give this extended notice, as competition is open to manufacturers in different parts of the world. Twelve months or more will elapse after the tender is accepted before the work is completed. The principal work is the building and erection of another engine at the power-house.

Additional Traffic Returns.—Anglo-Argentine, £1,372 increase; Barcelona Ensanche y Gracia, £210 increase; Barcelona, £278 decrease; Brisbane, £15 decrease (month of June, £9,575, decrease £612); British Columbia Electric (month of March), gross earnings £10,352, net income £2,658; Buenos Ayres and Belgrano Electric, £154 increase (month of April, £12,995, increase £1,123); Calcutta, £630 increase; Cape Town (month of April), receipts £16,003, expenditure £8,313; Isle of Thanet Electric, £78 increase; Mexico Electric (month of June), receipts £46,270; Perth Electric, £30 increase; Port Elizabeth (month of April), receipts £4,292, expenditure £2,281.

Bury, Rochdale, and Oldham Tramways.—It was stated at the last meeting of the Whitefield District Council that at a conference of representatives of the joint authorities interested in the acquisition of the Bury, Rochdale, and Oldham Tramway Company, held at Rochdale, the sub-committee appointed by the representatives of the various authorities to confer with the tramway company with reference to this matter reported that they could not agree upon a price for the purchase of the undertaking, and that they would have to resort to arbitration. They had, however, agreed upon a working agreement pending the decision of the arbitrator.

Bath.—Complaints are being made that the operations in connection with the laying of the tramways are not being carried out as expeditiously as they might be. The following resolution has been adopted by the Surveying Committee: "That the electric tramways company be informed that the Surveying Committee are much dissatisfied at the slow progress of the work of laying the tramlines through the centre of the city, and that unless immediate arrangements are made to carry on the work night and day, the committee must, in the interest of the convenience of the public, insist upon the limitations as to the length of street being open at the same time being strictly enforced."

Manchester-Liverpool Monorail.—The Manchester and Liverpool Electric Express Railway Company will be issued to-morrow (Saturday). The capital is £2,100,000 in £10 shares, all of which are to be offered to the public. The company is to construct and work an electrical railway between Manchester and Liverpool on Behr's so-called monorail system. The length of the railway will be about 34½ miles. It is proposed to run trains every 10 minutes at a speed of 110 miles an hour, doing the journey in 20 minutes, instead of the 40 minutes of the ordinary express trains. Two classes of passengers will be carried, at fares not exceeding those at present charged by the ther railways.

Dangerous Tramrails.—Dr. J. J. Gorham, M.D., writes to the *Times* calling attention to the danger to cyclists involved in the practice of oiling or wetting tramrails. Special reference is made to the London County Council's lines at Clapham, where the correspondent testifies that "it is almost impossible to avoid side-slipping on the tramrails so long as the authorities continue to deluge the metals, which they do almost daily, after the present fashion. The process of watering the roadway, as done by the ordinary water-cart, he says, is attended with little or no danger to anybody, but the method which the tram people adopt of pouring a copious stream of water on the wheel tracks leaves them in a greasy state for the rest of the day."

Bournemouth.—Application is to be made to the Board of Trade to borrow £14,000 for the purchase of 16 additional cars. A proposal for Sunday trams has been rejected in Council by a large majority. The Corporation of Poole and the Poole and District Electric Traction Company having withdrawn their opposition to the Tramways Bill of the Corporation of Bournemouth, which has already been passed by the House of Lords the Bill has been referred as an uncontested measure to the Committee of the House of Commons presided over by the Deputy-Chairman of Ways and Means. The Corporation of Bournemouth, in return, have withdrawn their opposition to the Bill of the Poole and District Electric Traction Company, which has been referred to the same committee.

Dewsbury.—A conference was held last week between representatives from Dewsbury Corporation, Ossett Corporation, and Soothill Nether District Council to take into consideration the question of promoting a scheme for the construction of a tramway between Ossett and Dewsbury. The feeling was generally expressed that a tramway line between Dewsbury and Ossett was highly desirable, and that it was necessary in the interests of the districts. A resolution was adopted recommending the three Councils to make a joint application under the Tramways Act to the Board of Trade for an order authorising the construction of such a line. It is hoped that the Councils will adopt this resolution, and that the ratepayers will give them active support in thus trying to promote the interests of the district.

Cardiff.—A discussion took place on the tramway finances at the last meeting of the Tramways Committee. Alderman Trounce, in speaking against the construction of an electric tramway along the old horse-line route from the monument *via* Penarth-road to Grangetown, complained that the accounts showing a profit of £9,500 on the tramways on the past year were inaccurate, inasmuch as a sum of £8,824 borrowed from the rates in the past year had not yet been repaid. The electrical engineer explained that £8,824 was voted from the rates in 1902 before the tramways got into working order. This past year £9,299 was estimated at the beginning of the year as being required in aid, but the sum was not wanted, and the clear profits for the year on the undertaking worked out at £9,500. It was decided to carry out the reconstruction work indicated above.

Romford.—The Select Committee of the House of Lords presided over by Lord Ribblesdale, have considered the Romford and District Tramways Bill. The Bill, which has passed through the House of Commons, provides for the construction of over three miles of electric tramways through the centre of Romford, joining up with the existing tramways of Ilford, at a cost of about £60.000. The Commons Committee imposed upon the promoters certain street widenings, estimated to involve a further expenditure of £21,000. Mr. Vesey Knox now asked, on behalf of the Romford Urban Council, that where the roads were widened the promoters should give a pavement 8ft. wide. The committee, after hearing evidence on both sides, passed the preamble of the Bill, but declined to accede to the request of the Urban Council. Clauses having been adjusted, the Bill was ordered to be reported for third reading.

Newport (Mon.).—At the last meeting of the Council it was proposed that the Tramways Committee be requested to report upon the question of the adoption of motor 'buses in lieu of tramway on the Stow-hill route, but the motion was lost after a good deal of discussion by nine to seven. An alderman objected to a proposal by the Electricity Committee to purchase 10 additional electric cars. His own impression, founded on the procession of cars he saw frequently in Commercial-street, two or three or more following each other closely, was that there were 10 too many now. The chairman of the committee said the through service from the three routes necessitated frequent cars running along Commercial-street. There were 30 cars at present, and when the four routes were open it would be necessary to provide for the traffic in a proper way. Several members afterwards complained of the fewness and irregularity of the cars on certain sections. The purchase of the cars at £4,780 was afterwards decided upon.

Manchester Southern Tramways.—A committee of the House of Commons presided over by Mr. Gair Ashton has considered the Manchester Southern Tramways Bill, which passed the House of Lords as a practically unopposed measure. There were now several petitioners, including the Eccles Corporation, the Barton-on-Irwell District Council, the Manchester Corporation, the Manchester South Junction and Altrincham Railway Company, the Salford Corporation, and the Sale District Council. Counsel for the promoters of the Bill explained that although there was only one opponent on the preamble, and that was the Manchester South Junction and Altrincham Railway Company, who opposed on various grounds, that morning the promoters had come to terms with them. It was unnecessary, in these circumstances, to go into the merits of the Bill. He stated for the information of the committee that the promoters were persons of financial standing, and that there was no question about their ability to carry out the scheme. The Chairman declared the preamble proved, and the Bill will now be reported to the House for third reading.

Wellingborough.—The Select Committee of the House of Lords o which Lord Harris is chairman has had under consideration the Wellingborough and District Tramroads Bill. Mr. Balfour Browne, in opening, explained that by a Bill obtained in 1900 the British Electric Traction Company were authorised to construct a system of electric tramways connecting Wellingborough with Irchester, Rushden, Higham Ferrers, Irthlingborough, and Finedon, with a branch to Raunds. The object of the present Bill is merely to sanction the abandonment of a very small portion of the authorised line and to substitute a new tramroad for it. The deviation would cross the L. and N.W. Railway by means of a level crossing near Higham Ferrers Station, and running along the public road join the authorised line at the east end of the village of Irthlingborough. The proposed alteration had the consent and approval of all the local authorities. In connection with it the company had undertaken to widen a bridge over the River Nene, which very badly needed widening. The L. and N.W. Company objected to the tramway crossing their

Digitized by Google

line. Evidence on behalf of the promoters was given. The Chairman, in giving the decision, said the committee could not agree to the level crossing, but would allow the promoters to construct a bridge over the line, or they could follow the old course. Mr. Moon thought that in the circumstances it was unlikely that the promoters would proceed with the project.

Birmingham.—An important step in the direction of joint operation as to the tramways has been taken by the Birmingham Corporation and the British Electric Traction Company. During the progress of the recent Bill promoted by the British Electric Traction Company and several local authorities to enforce running powers over the Birmingham lines, great stress was laid on the dislocation of traffic resulting from having to change from the company to the Corporation car at the city boundary. Since the parliamentary enquiry on the Bill, Birmingham has entered into a definite undertaking with the company to allow them to run their cars over two of their city lines to the central terminus. The first of a series of conferences between the Tramways Committee and the suburban authorities who have not allied themselves with the British Electric Traction Company was held on Monday. The object of these meetings is to try to arrive at the bases of understandings which will admit of arrangements being made to facilitate intercommunication between the city and the outlying districts. Monday's conference was with the representatives of King's Norton, in whose district are the Moseley-road, King's Heath, and Bristol-road termini. The District Council of King's Norton have come to the decision to exercise their right to purchase the portions of the Moseley and King's Heath lines in its district in 1906, when the leases of the Birmingham portion of these routes expire, and as Birmingham has now resolved to purchase those sections of the lines which were in the district of the old Balsall Heath Local Board, it is not expected that any difficulty will be experienced in arriving at a practical issue, especially as the Birmingham Corporation are willing to rent to the City of Birmingham Tram Company the sections of the line it is about to purchase from it. Although nothing definite was settled, all concerned are hopeful of the result being eminently satisfactory.

Middlesex.—The hearing of objections to the confirmation of the County of Middlesex Light Railways Order made by the Light Railway Commissioners took place on Wednesday last week, at the Board of Trade, before Sir Herbert Jekyll, assistant secretary of the railway department. The order authorises the construction of light railways in the parishes of Acton, Edgware, Edmonton, Enfield, Finchley, Friern Barnet, Hendon, Hornsey, Little Stanmore, Southgate, Tottenham, Wembley, Willesden, and Wood Green. The County Council, the Great Northern Railway Company, the New River Water Company, the local authorities, and various owners were legally represented. Clause 62 dealt with the important question as to whether the County Council should be entitled to carry parcels on their light railways, which might be in competition with the Great Northern Company, the arrangement having been come to between the parties that they should only be entitled to carry passengers' luggage up to a certain weight. Mr. Hill Dawe, solicitor to the company, said the serious question was raised whether the principles which governed the procedure and practice as to private Bills were to have any recognition with regard to light railway orders, whether, in other words, agreements with promoters were to be respected. When opponents of a scheme withdrew their opposition on the preamble on the faith of an agreement they were damnified beyond redress if the agreement were not carried into effect, and the authorities at the House recognised this. In this case a light railway was promoted which would compete with the Great Northern Company, and the company had come to an agreement with the Council as to traffic. But the Light Railway Commissioners had written that Clause 62 went rather beyond what could be properly allowed having regard to the possible interests of the public. He urged that unless agreements were respected it would put an end to all negotiations. Sir Herbert Jeckyll promised that the Board of Trade would consider the point. The order was passed.

Doncaster.—Mr. W. Wyld, borough electrical engineer, has presented a report to the Tramways Committee, in which he gives some interesting figures showing the progress of the electric tramway undertaking in the town. The number of passengers carried since Saturday, June 6, to Saturday last, July 11, was 249,916, representing a revenue of £1,033. 1s. 4d., the numbers for the corresponding weeks last year being 184,429 (£767. 14s. 4d.). The total receipts for the five weeks were as follows: week ending June 13, £166. 5s. 11d.; June 20, £169. 2s. 1d.; June 27, £203. 17s. 4d.; July 4, £296. 9s. 3d.; and July 11, £197. 6s. 4d. The abnormal receipts for the week ending July 4 were due to the agricultural show and Bentley Feast. From the figures given in the report it is noticed that there have been 5,943 ½d. fares since the committee decided to run workmen's cars, this representing 2·3 per cent. of the total number of passengers carried. Although this does not show any great improvement in the revenue, yet it shows that the tramways are fulfilling one of the objects of their institution—*i.e.*, the provision of a cheap form of conveyance to a certain class of the public. The department has just completed the first quarter of the second year. The total expenditure amounted to £2,291. 7s. 10d., while the total receipts were £2,719. 7s. 5d., leaving a credit balance over working expenses of £427. 19s. 7d. The sinking and redemption fund for this period amounts to £677. 2s. 9d., and this brings the net result for the last quarter ending June 30 to a debit balance of £249. 3s. 2d. The expenses during the last quarter include an item of £368. 5s. 4d. for damages and costs in the Nicholson case, and had it not been for this item there would have been a net profit of £120. 2s. 2d. The amount oi £134. 10s. 4d. for the scavenging and repairing of the track outside the borough is included in the expenditure this quarter, but is really for the past year. The average total working cost per car mile works out at 6·18d., leaving a balance between total working costs and receipts per car mile of 1·08d. During the thunderstorm on Saturday afternoon last the overhead line in Thorne-road was struck by lightning, and the insulators on the last bracket arm on that section broken down, which delayed the traffic about an hour.

London County Council (Tramways and Improvements) Bill.—This week the Select Committee of the House of Lords over which Lord Harris presides, were engaged in considering the proposals embodied in this Bill. Mr. Erskine Pollock, K.C., for the London County Council, said that, with the exception of two short lengths, the proposed tramways were all in the borough of Hammersmith. No. 3 was a double line nearly three miles in length, beginning in Scrubbs-lane, on the north side of Wormwood Scrubbs, at the county boundary, and terminating in Queen-street, near its junction with Bridge-road, joining the line authorised last year. In connection with this certain widenings were necessary, and would be carried out before the tramway was made. In connection with this line two short lengths of tramway (single lines) were proposed making junctions with the existing lines of the London United Tramways Company. Tramway No. 4 was a double line of 2 furlongs 4·21 chains beginning in Broadway, Hammersmith, by a junction with No. 3. Passing along Bridge-road, it would stop on the London side of Hammersmith Bridge. Other tramways proposed were in the parishes of Streatham and Wandsworth, No. 6, a double line 1 furlong 6·20 chains in length, beginning at the south-western end of Wimbledon-road, would terminate in Garratt-lane in a junction with the line authorised in 1901, and No. 6A, a short double line beginning in Wimbledon-road, would terminate in Garratt-lane. The lines were proposed to be constructed for the use of electrical power in the working, and certain sections of the Act of 1890 were incorporated by which it was provided that tramway lines within the London area should be electrified under the same rules. The cost of lines Nos. 3, 3A, and 3B would be £68,000 odd, and in connection with these certain widenings and improvements were proposed at a cost of £64,300, of which the Hammersmith Borough Council would contribute a third. The cost of Nos. 4 and 4A would be £15,500, and of the Wimbledon sections £8,300, and the cost of widening would be £5,300. Opposition to the Bill came from the London General Omnibus Company and owners and occupiers of property, and the Hammersmith Council raised various objections. Evidence in support of the Bill was given by Mr. J. W. Benn, chairman of the Tramways Committee of the London County Council; Mr. M. Fitzmaurice, C.E., engineer to the Council; and Mr. A. Young, valuer to the Council. On Tuesday Mr. Pollock said an agreement had been arrived at with the Hammersmith Borough Council, and the latter were now fully protected. Therefore their petition would be withdrawn. On Wednesday the committee found the preamble proved so far as Tramway No. 3 was concerned, it being understood that there was an undertaking on the part of the London County Council that the method of crossing the lines of the London United Tramway Company should be settled by the Board of Trade, and that all costs approved by the Board of Trade in relation to the crossing would be borne by the London County Council, including supervision should that be necessary. The committee found the preamble proved in reference to Tramway No. 6, and in regard to No. 4, except that they did not see the necessity for carrying on the tramway to the proposed terminus. The committee thought it should be terminated at a point a little to the south of Bridge-street.

Halifax.—The tabulated tramway accounts for the year ended March 31, 1903, have now been issued. The revenue from all sources amounted to £61,448, and the expenditure, including sinking fund and interest to £61,661, leaving a deficiency of £213 to charge to the renewal fund. Some of the principal features in the accounts are worthy of particular mention. In 1898·9 the Corporation had 6¼ miles of track and 17 cars. In 1902·3 the track had increased to 30¼ miles, and the number of cars had advanced to 82. In the former period 160,319 miles were run by the cars, and 2,594,478 passengers were carried. Last year the car miles run had advanced to 1,219,939, and the number of passengers reached the enormous aggregate of 14,676,254 persons, or only a small number short of 15,000,000. The receipts during the same time had increased from £10,810 in 1898·9 to £61,151 for the 12 months ending March 31 last. In regard to the receipts per mile run, the return was not so favourable. This stood at 16·20d. in 1898·9 and at 13·27d. in the following year. Since then there had been a gradual diminution, until last year 12·08d. per car mile was recorded, or just a fraction over 1s. In regard to the cost per mile run, the returns show a gradual lessening, which may be possibly regarded as a set-off to the smaller revenue per mile earned. This stood at 10·88d. in 1898·9, and at 9·03d. last year, and which in itself is a reduction of just over ¼d. per mile run, compared with 1901·2. The charges for interest have gone up from 1·54d. in 1898·9 to 1·84d. last year, the highest point yet reached. The amount required for sinking fund has also advanced in the same period from ·57d. to 1·25d. per mile. This brings the total cost to 12·12d. per mile, compared with 12·08d. in receipts, or equivalent to a loss of ·04d. per mile run, an insignificant item on the distance stated, but a substantial figure when the total mileage covered in 22 months is taken into consideration. The previous year, 1901·2, resulted in a loss of 0·7d. per mile, so that relatively speaking the cars last year did slightly better, owing apparently to economies in working. But in 1898·9 there was a profit of 3·21d. per mile, in 1899-1900 a profit of 1·36d. per mile, and in 1900-1 a profit of ·48d. The accounts also show an interesting series of comparisons with the previous year, of which those appended are the most important. In every case the figures first given refer to 1901-2, and the second lot of figures to 1902-3. Expenditure side: current, £14,395, against £16,163; traffic (wages, etc.), £11,941, against £13,811; cleaning cars, £1,322, against £1,275; general repair of cars, £3,029, against £2,598, an appreciable reduction; electrical repair of cars, £1,095, against £1,204; maintenance of permanent way, £1,861, against £2,889; maintenance of works, £512, against, £391; overhead equipment, £1,847, against £1,193; management expenses, £2,238,

Digitized by Google

against £2,488; rent, rates, and taxes, £2,727, against £2,094, a reduction on rates which wants some explanation; legal and parliamentary expenses, £300, against £398; and miscellaneous, £340, against £323. The receipts from passengers on the other side amounted to £61,390, as compared with £54,891 in 1901-2, and from parcels £238, against £77. The latter figures show that the parcel traffic was increasing. The deficiency on the net revenue account for the year is debited to the renewal fund, which has now a balance of £5,536. The expenditure on capital account is £313,232.

London County Council.—The annual accounts of the receipts and expenditure in connection with the London County Council's tramway undertaking for the year ended March 31 last were presented at Tuesday's meeting. With regard, first, to the southern system, which is owned and worked by the Council, the net capital expenditure on these tramways amounted at the end of March last to £1,504,460, of which £93,400 has been repaid out of revenue. During the year 1902-3 the expenditure on capital account amounted to £617,210. The total receipts from the undertaking during the year amounted to £444,698, while the working expenses were £397,080, showing a surplus revenue on working of £47,618. Debt charges have had to be met (*a*) for interest £25,627, and (*b*) for sinking fund £24,242—together £49,869—leaving a deficiency of £2,250 to be carried to the appropriation account. The committee attribute this deficiency mainly to the loss of receipts from the dislocation during the reconstruction of parts of the tramways for electrical traction, and they confidently anticipate that when the work is completed and the tramways are being worked by electrical power the receipts, and consequently the surplus revenue, will be largely increased. The Council have established in connection with the undertaking a renewals reserve fund, to which £11,000 has been added during the year out of revenue, and the total amount of the fund on March 31, 1903, was £35 072. 0s. 3d. The moneys of this fund are being used to defray the expenditure incurred during the year in connection with the establishment of temporary power stations at Loughborough Junction and at Deptford for the electrical working of some sections of the tramways pending the construction of the permanent electricity generating station to be established at Greenwich. The total expenditure for these temporary stations is estimated at £27,100, and it has been arranged that this shall be met out of the reserve fund, and repaid out of revenue during the three years ending March 31, 1906, or during the period that the temporary stations shall be required. The number of passengers carried during the year 1902-3 was 109,615,496, a decrease of 10,265,063 on the previous year's figure, due to the fact that the traffic on the sections of the tramways which have been reconstructed for electrical traction was necessarily interfered with to a large extent while the work was in progress. The accounts of the northern system—the lines leased by the Council to the North Metropolitan Company—show a different result. The receipts from these lines during the year by way of rent and percentage of increased receipts amounted to £75,222, and after allowing for certain rent drawbacks, the actual net receipts to the Council were £74,764. Out of this, sum interest and sinking fund charges amounting to £36,970 have been paid, so that the surplus revenue carried to appropriation account was £37,794. Expenses amounting to about £5,000 during the year in connection with the promotion of tramway legislation by the Council have been charged to revenue account. The deficiency on general account amounts to £5,855, making, with that on the southern lines, a total deficiency of £8,106 to be charged against the surplus revenue of the Council's tramways. After deducting that amount from the surplus on the northern system and carrying £20,000 to the relief of rates, a balance of £9,869 is carried forward. Reporting on the application of surplus revenue from the tramways, the committee state that the surplus available on April 1, 1902, was £45,181. 16s. 5d., of which £45,000 has been applied in relief of rate, leaving a balance of £181. 6s. 5d.; the surplus revenue on the northern system in respect of the year 1902-3 is £37,794. 0s. 4d., while the deficiency on the southern system is £2,250. 16s. 10d., and on the general account is £5,855. 13s. 6d., making a total of £8,106. 10s. 4d. The available surplus revenue, including the balance of £181. 6s. 5d. above referred to, amounts, therefore, to £29,869. 6s. 5d., and they propose that £20,000 should be transferred for relief of rates, leaving a balance of £9,869. 6s. 5d. to be carried forward to the year 1903-4 account. A special report, covering some nine pages of the agenda, was also submitted by the Highways Committee containing proposals for new tramways, and advising an application to Parliament for the necessary powers in the next session. The total mileage of the proposed new lines is 29½, and the doubling and reconstruction of existing tramways accounts for another 3¾ miles. The estimated cost for the construction or reconstruction of the tramways, the paving of the tramway tracks, the provision of cars and car-sheds, and other works in connection with the tramways, amounts to about £1,580,325. The necessary street widenings in connection with the scheme are estimated to cost £722,230, so that the total expenditure involved is £2 302,555. This is to be met as follows: estimated recoupment by sale of surplus property, £37 430; contributions from local authorities, £228,261; improvement charge to be borne by the Council, £228,267; and tramway charges for improvements, £228,267; and for construction, etc., £1,580,325. The only charge on the rates will be the outlay by the Improvements Committee of £228.000 on street widenings, and this will be equivalent to about £11,500, or ·06787d. in the £. The proposed new lines, which are mostly revivals of former schemes which have been dropped or rejected by Parliament, are as follows: Hampstead-road tramways terminus to a point in Tottenham Court-road near Oxford-street; Westminster Bridge-road, *via* Victoria-embankment, to north side of Strand; Southwark-street to Lambeth Palace-road; Waterloo-road tramway terminus to a point opposite York-road; Goose-green to Stuart-road, Peckham; Greenwich to East India Dock-road, *via* the Blackwall Tunnel; Shepherd's Bush-road to a point near the Marble Arch; Marble Arch to Cricklewood; Battersea Park-road, *via* Battersea Bridge, to King's-road, Chelsea; Clapham Common to East-hill, Wandsworth; Streatham tramways terminus to county boundary; authorised tramways in Tooting High-street to new county boundary; Lordship-lane to Forest-hill; Lewisham High-road to Forest-hill; New Cross, *via* Lewisham High-road, to Lee-green; Deptford to the Herbert Hospital, Woolwich; doubling of part of and reconstruction of the existing tramways from Beresford-square, Woolwich, to the terminus at High-street, and construction of new tramways thence to county boundary, near Abbey Wood; doubling of existing tramways from Greenwich to Catford. It is proposed to adopt the underground conduit system, with the exception of two routes—one at Woolwich and the other through the Blackwall tunnel, which will be constructed on the overhead trolley system. A further report by the same committee recommended the expenditure of £148,500 for the purchase of plant for the electricity station to be established at Greenwich, including (*a*) three 5,000-h.p. steam generators; (*b*) 10 water-tube boilers with mechanical stokers; (*c*) pumps, tanks, steam, exhaust and feed piping, etc.; (*d*) economisers and switchgear; (*e*) connecting cables, etc. Plans are to be prepared in connection with the proposed Pimlico generating station.

LIGHTING AND GENERAL.

Guildford.—The electricity company intend to extend their main in Mount-street.

Beverley.—The order obtained by the Corporation will lapse at the end of the present month.

Harrogate.—The Town Council have received sanction to borrow £46,000 for electric lighting purposes.

Slough.—The Slough and Datchet Electric Light Company commenced to supply customers on Saturday.

Hollingbourne.—The District Council will oppose the Kent Electricity Company's Bill for the installation of electric light in the district.

Worcester.—The Electricity Committee are considering the question of supplying electricity for power purposes to works in the city.

Newquay.—The Southern District Electricity Corporation intend to apply for a provisional order for the supply of electricity to the urban district.

Warrington.—Owing to increased demand for electric light, the Town Council have decided to lay a new electric feeder and to extend the electric mains.

Colchester.—Mr. H. Ross Hooper has held an enquiry into the application of the Council for sanction to borrow £6,983 for purposes of electric lighting.

Globe Telegraph and Trust Co.—The directors announce a quarterly dividend of 3s. each on the preference shares and 2s. each on the ordinary shares.

Dublin.—Delegates from the International Trades Congress inspected the Corporation electric lighting works at the Pigeon House and in Fleet-street last week.

Watford.—Mr. H. Ross Hooper has held an enquiry into the application of the Urban District Council for sanction to borrow £1,500 for purposes of electric lighting.

Godalming.—The Inland Waterways Company intend to apply in the next session for a provisional order to supply electricity within the Rural District Council's district.

Seaford.—The Hiram Maxim Electrical and Engineering Company, Limited, intend to apply for a provisional order authorising the supply of electrical energy in the district.

Braintree.—The Urban District Council will oppose the application of the Southern District Electricity Corporation, who intend to apply for a provisional order to supply electricity within the urban area.

Ulverston.—The Urban District Council will object to the application of the electric light and power company who intend to apply for a provisional order to supply electricity within the Council's area.

Pontypridd.—The District Council have decided not to enter into an agreement to take energy in bulk from the South Wales Electrical Power Distribution Company, but to erect their own generating station.

Excursion.—On Saturday last the annual excursion of the employés of the Hart Accumulator Company took place. A very enjoyable day was spent at Hastings, the party returning to town in the evening.

Bognor.—The Urban District Council have decided to adopt the principle of an electric lighting scheme submitted by Messrs. J. and S. Enright (for Messrs. Suter and Co.), subject to the security being satisfactory.

London County Council.—The Council on Tuesday agreed to lend the Stepney Borough Council £2,790 for electric lighting and street-lighting purposes, and the Battersea Borough Council £2,336 for street-lighting purposes.

Bishop's Stortford.—The Bishop's Stortford Electricity Supply Company intend to apply for a provisional order for powers to supply electricity for public and private purposes. The Urban District Council will take no action at present.

Brighton.—The Telephones Committee have decided to apply for sanction to the borrowing of £3,000, being the estimated cost of the execution of the necessary works to include the borough of Hove in the Corporation telephone system.

Llandilo.—The Urban District Council are considering the tender of Mr. Bertram Thomas of £1,192 for the new plant and for maintenance for a year, and for supply of light at £290 up to 22,000 units, and at 1½d. per unit for additional current.

Digitized by Google

Sunbury.—The Twickenham and Teddington Electric Supply Company intend to apply for a provisional order for supplying electricity in the urban district. The District Council will confer with the company's representative at the next meeting of the Council.

Macclesfield.—The Electricity Sub-Committee of the Corporation are undertaking a second canvass of the town with the object of ascertaining what demand there is likely to be for electricity in the event of an installation being established in the borough.

Northwich.—At a recent meeting the promoters of the North-Western Electricity and Power Bill decided to consent to the amendments suggested, giving the local authorities reasonable protection. In consequence the petition against the Bill has been withdrawn.

Wirral.—The Rural District Council have withdrawn their opposition to the North-Western Electricity Bill, having secured nearly everything they desired. But they have not obtained the same privileges for the district roads as the County Council did for the main road.

Torquay.—The Electric Light Committee in their last report state that an equivalent of 98 8-c.p. lamps were connected during the month, and there are six applications in hand. The committee were of opinion that the present-day demand would not justify the laying down of a main at Chelston.

Kingstown.—The Electric Lighting Committee of the Urban District Council are considering an offer from Mr. William M. Murphy, chairman of the Dublin Tramway Company, to supply Kingstown with electric current on favourable terms without any capital expenditure by the Council.

Glastonbury.—The Southern and Western Electric Corporations intend to apply for provisional orders to supply electricity within the borough. A sub-committee has been appointed to consider the matter and report to the Council. The Town Council's application for the telephone is before the postal authorities.

Hackney.—The Borough Council have decided to reduce the price charged for electrical energy for power purposes from the flat rate of 2d. per unit to the following: for the first 1,000 units per quarter at any one premises, 2d. per unit; all consumption in excess of 1,000 units per at any one premises, 1½d. per unit.

Chippenham. — The Southern District Electricity Corporation intend to apply for a provisional order to supply electricity within the borough. The Town Council have given notice to the Rural District Council of intention to apply for an order to supply with electricity the districts contiguous to the borough.

Caerphilly.—Messrs. Herbert Lewis and Fletcher, of Cardiff, intend to apply for a provisional order for electric lighting within the area of the Council. A similar notice has also been given by the Empire Electric Lighting and Power Company. A special meeting of the Council will be called to consider the whole matter.

Direct United States Cable Co.—The directors recommend a final dividend of 's. per share and a bonus of 1s. per share, making, with the three interim dividends already paid, a total distribution of 3¼ per cent. for the year ended June 30 last. After placing £8,000 to reserve fund account, it is proposed to carry forward a balance of about £2,693.

Electricity in Entertainments.—The electrician at the Oxford frequently makes practical and effective use on the stage of the elaborate electric light installation which is at his command. At present there may be seen as part of a magnificent programme a combination of lamps and acrobatic feats which ought to interest some of the inquisitive amongst our readers.

Dorchester.—At Tuesday's meeting of the Town Council, the Electric Lighting Committee reported that as the proposed cost of the power station with gas plant, machinery, cable, and arc lamps for installation of the electric light over the compulsory area was so excessive, they had adjourned the further consideration of the question for the attendance of the electrical engineer.

Bermondsey.—The Electric Lighting Committee of the Borough Council, at the last Council meeting, asked permission to deal with the tenders, when received, for the erection of a destructor, engine-room, and new boiler-house, etc., in connection with the extensions to the electric lighting installation. The Council, however, decided that a special meeting should be held on the occasion.

Whitefield.—The Council have received the following offer for electric lighting: general supply, 7d. per unit on the maximum demand system for one hour per day, and 3d. per unit for all additional consumption; domestic supply, 5d. per unit; motive power and heating, 4d. per unit on the maximum demand system of one hour per day, and 1d. per unit for all additional consumption.

East Molesey.—The Twickenham and Teddington Electric Supply Company, Limited, intends to apply for a provisional order for electric lighting in this urban district. The Council have decided that before they give any consent to the application the company should undertake to pay all their expenses, together with the £100 or thereabouts which the Council has already spent in regard to the proposed provisional order.

Whitehaven.—The Urban District Council have resolved that on and after Oct. 1 next, the charges for current supplied to private consumers of £12 per annum and 2d. per unit by meter be reduced to £8 per annum and 2d. per unit, and the uniform charge from 6d. to 4½d. per unit. Application will be made for sanction to borrow the sum of £2,500 for the main to the union workhouse and infirmary and extension of mains.

Farnham.—The Sir Hiram Maxim Electrical, etc., Company, Limited, intend to apply for a provisional order for the supply of electricity in Farnham. The Inland Waterways, Limited, have given similar notice. The National Electric Wiring Company, Limited, have made an offer for working the Council's electric light provisional order. The matter will come before the Council in committee at a meeting on Friday.

North Ormesby.—The District Council have referred to a committee a letter from the National Wiring Company, Limited, pointing out the conditions on which they would be prepared to run electric works in the locality, the Council to apply for the provisional order and to provide the capital, and a notice from the Empire Electricity Company of intention to apply for a provisional order for power to lay down works in the district.

Stock Exchange Settlements.—The Stock Exchange Committee have ordered Charing Cross and Strand Electricity Supply Corporation, Limited, further issue of £49,712 4 per cent. debenture stock (redeemable) to be quoted in the official list. Applications have been made to the committee to allow British Electric Traction Company, Limited, further issue of 75,000 6 per cent. cumulative preference shares of £10 each, fully paid, to be quoted in the official list.

Southwark.—The Borough Council have decided that, with the view of encouraging the more general use of electric energy for motor purposes within the Council's area of supply, the electrical engineer should be authorised to enter into an agreement with the British Thomson-Houston Company, Limited, to act as their agent for the sale of motors on the hire-purchase system, the Council having no power to raise money for that purpose or conduct such a business themselves.

Malling.—The Kent Electric Power Syndicate and the Kent Electric Power Company propose to apply at the next Board of Trade session for a provisional order authorising the supply and distribution of electricity for lighting and other purposes within the whole of the Malling area. The Rural District Council are making enquiries especially in regard to the imposition of a time limit and the possibility of being able to purchase the undertaking at cost price at the expiration of a certain period.

Swindon.—The electrical engineer has submitted a statement showing the extensions of the electric mains which may be carried out during the next three or four years, together with an estimate of the cost, with the view of obtaining the sanction of the Local Government Board to the necessary borrowing power. Applications have been received for the supply of current to several premises in Devizes and Westlecott roads and Goddard-avenue. These mains will be available for street-lighting, and will be carried out at a cost of £700.

Finchley.—The North Metropolitan Electric Power Supply Company propose shortly to open up the roads in this Council's district for the purpose of laying mains for the supply of electricity in bulk, and the laying of high-tension cables in connection with the authorised light railways in this district. It has been recommended (1) that as the plan accompanying such notice does not furnish the particulars specified in the company's Act, preliminary objection be taken thereto; (2) that notice be given to the company that the Council object to their supplying energy in bulk within this district, under Section 11 of their Act; (3) that notice be given to the County Council of Middlesex as the authorised users within the said section that this Council will be prepared to consider applications for the supply of such energy.

Useful Arts Catalogue.—Mr. Basil Anderton, B.A., chief librarian at the public library, New Bridge-street, Newcastle-upon-Tyne, has recently issued a new catalogue of books on the useful arts, with the object of bringing home to readers a knowledge of the large resources of the library, so that the fullest use may be made of its books and the greatest possible benefit be obtained from them. We find that nearly six pages are taken up with works on electrical engineering, apart from books specified under the heading of automobiles, tramways, telegraphs and telephones, etc. The general works include books on theory of electricity, electrical journals, etc. There are separate sections for dynamo machines, electric lighting, electric railways and tramways, transmission of electric force, and storage of electric force. The catalogue is properly indexed, and is divided into an authors' list, also a list of anonymous works and periodicals and subject list, and is by far the best production of its kind which has come under our notice.

New Issues.—The Charing Cross and Strand Electricity Supply are issuing 40,000 "City Undertaking" 4½ per cent. cumulative preference shares of £5 each. The business of the company is divided into two sections—namely, the City undertaking and the general undertaking, each having a share capital of £800,000. The prospectus states that the generating station at Bow and the sub-stations at Fenchurch-street, Upper Thames-street, and Ludgate-hill have been in partial use since May, 1902, and are now equipped with plant in full working order sufficient to give supply to 350,000 8 c.p. lamps. Supply is actually being given to 194,000 8-c.p. lamps, and other contracts have been entered into for 32,000 lamps. A fourth sub-station is being proceeded with. The gross revenue of the city undertaking in 1900 was £974, in 1901 £8,850, and last year £28,537.—Subscriptions are invited for a first issue of 15,000 shares of £10 each in the Havana Electricity Company, Limited, which has an authorised capital of £300,000. A concession has been granted for the supply in the city of Havana of electric current to the public, industrial concerns, and others for lighting and power purposes.—The Isle of Wight Electric Light and Power Company, Limited, are making an issue of 10,000 5 per cent. cumulative preference shares of £5 each and £50,000 4½ per cent. debenture stock at 102 per cent. The company was formed in 1897 with a share capital of £100,000, and has now acquired powers for supplying electricity in all the principal towns in the Isle of Wight. The supply will be given from four central stations, three of which have already been erected and opened. The profits for the past three years are reported to have been £1,117 in 1900, £1,323 in 1901, and £3,184 last year. Including the proceeds of the present issue, the company's assets are valued at £150,000.

Digitized by Google

Trowbridge.—The Council have decided to apply to the Board of Trade for an extension for a term of two years, as the margin of the Council's borrowing powers until the completion of the sewage-disposal works now in progress cannot at present be ascertained. A draft lease has been sent to Messrs. Pressland and Fippard, the firm who desired to lease the order. The Urban District Council have replied to the Somerset and District Electric Power Bill Company, who wrote asking the Council to sign a petition in favour of the Bill, that the Council had their own provisional order.

Fareham.—The report of the Lighting Committee for the year ending March 31 last shows a credit balance of £128, which is to be carried forward to the reserve fund to meet contingencies. The cost of public lighting was fixed at £655. The mains are to be extended towards Catisfield as far as Heathfield. This will cost £250, but at any time the main can be further extended. The electric light department has made £108 more profit than last year, besides paying off £500 on the loan. Sanction is to be obtained to a further loan of £500 for an additional transformer and other matters.

Lowestoft.—The Electric Lighting Committee have offered the Coast Development Company to supply light to the Claremont Pier at the rate of £4 per quarter per lamp of about 1,000 c.p. each, including maintenance, the company to supply and fix all standards, globes, and fittings. The resident engineer's last report states that since his previous report 30 consumers had been connected to the mains, representing 247 8-c.p. lamps. The total of consumers is now 401, representing 13,639 8-c.p. lamps. The minimum charge for power purposes has been fixed at 10s. per quarter, exclusive of meter rent, and a minimum charge for ordinary lighting will not be made in future.

Newport (Mon.).—The Parliamentary and Improvement Committee of the Corporation on Tuesday again reported on the question of the proposed establishmeet of a third telephone system in Newport, with reference to which Mr. Bennett has been in communication with them for some time past. They recommended that the National Telephone Company be informed that any further wayleaves which they require from the Corporation will only be granted conditionally upon the right of intercommunication being allowed between the subscribers of the Post Office system and the National Telephone Company's system, and that if they are not prepared to assent to this condition the Corporation may be recommended to support the establishment of a new system.

London Gazette.—The Stewart Electrical Syndicate, Limited, is to be wound up voluntarily, and Mr. G. Stanhope Pitt, 140, Leadenhall-street, E.C., has been appointed liquidator. The English and General Tramways Company, Limited, is to be wound up voluntarily, and Mr. P. J. Brenchley, 1 and 2, Great Winchester-street, E.C., has been appointed liquidator. The estate of C. A. Church (trading as Henry Connolly and Co.), manufacturing electrical engineer, 42, Hampstead-road, London, has been released from bankruptcy. A first amount of 9d. per share in the estate of the Electric Lamp Regenerating Company, Limited, 3, Crown-court, Old Broad-street, E.C., will be paid any day (except Saturday) between 11 and 2 at the Official Receiver's Offices, 33, Carey-street, Lincoln's-inn, W.C.

Bournemouth.—With regard to the suggested municipal telephonic system, it has been decided to defer coming to any decision until certain further information expected from Portsmouth, Guernsey, and Hull has been received, it being left to the chairman and town clerk to obtain the information and fix the date of the next meeting. The borough electrical engineer in his last report says: "From the opinions expressed at the two towns visited by the deputation—viz., Portsmouth and Tunbridge Wells—by both opponents and supporters of municipal schemes, it would seem there is no doubt that a municipal telephone system in Bournemouth, with a scale of charges of £6 for an unlimited number of calls and £3. 10s. at 1d. per call and a minimum charge of £1. 10s. per annum for calls, would pay its way."

Wolverhampton.—The annual report of the Lighting Committee shows a gross profit of £11,697 and a net profit of £2,479. The committee state that the year's working has been most satisfactory. A debt of £2,929 on old engines has been extinguished, and the department will in future be relieved from a payment of £168 annually in respect of interest and sinking fund on that amount. Another feature of interest is that the change-over of the system of supply is now completed, and consequently the revenue of the undertaking will not in future be burdened by further charges in that respect. During the past year the output of electrical energy for motive power has increased by 160 per cent., but the output of electricity for tramway purposes has not been quite so large as was anticipated. The Town Council have obtained sanction to the borrowing of £14,000 and £1,000 for electric lighting purposes.

King's Lynn.—The electrical engineer in his last report states that applications had been received for 427 additional lamps of 8 c.p. or equivalent, making a total of 15,799 from private consumers. The applications include three motors of 2½ h.p. each. The total number of consumers is now 414. The total number of units generated for May was 22,856, as compared with 19,473 in May, 1902. The following figures were appended: units generated, May, 1903, 22,856; May, 1902, 19,473; units sold to private consumers, 7,603 (4,949); units sold at power rates, 3,427 (1,589); cost of fuel, stores, repairs, and wages at station, £119. 8s. 10d. (£116. 8s. 2d.); cost per unit generated, 1·25d. (1·43d.); wages of lamplighters and outside staff, £19. 19s. 7d. (£16. 19s. 7d.). An agreement is being entered into with the Midland and Great Northern Railways Joint Committee as to laying cables under their property. The electrical engineer has been instructed to prepare and submit to a future meeting a report on the proposed extension of plant.

Factory Plant.—The National Electric Wiring Company, Limited, 34, Victoria-street, S.W., have just put down a neat electrical installation for the confectionery works of Messrs. Geary and Co., Limited, at Limerick. The chief items of note are a 100-h.p. Duffs producer, two National gas-engines, two B.T.H. 30-kw. generators, three 10-h.p. and two 5-h.p. B.T.H. C.E.-type motors. The gas-engines are capable of developing 40 h.p. on producer gas. All the motors are bolted up to the ceilings in inverted position; starting panels are of enamelled slate and have double-pole switch and fuse, together with B.T.H. starting rheostats with no-volt release and overload circuit breakers. The main switchboard is made up of three panels bolted to angle-iron framework, and is 10ft. long by 4ft. high; the two outside are generator panels, and the centre is the distributing panel and consists of 12 change-over switches, with 'bus bars and fuses. There are also 240 lights and four arc lamps. We are informed that the whole plant has worked direct from the commencement without hitch, and has given great satisfaction. The cost of running is, as Mr. Geary states, very low, amounting to only ¾d. a unit generated, or about ½d. per horse-power hour.

Fulham.—The Borough Council have replied to the London County Council in reply to their letter stating that "assets represented by property can only be set against debt to the extent to which such property can be sold without impairing the ability of the Borough Council to continue its duties," that most of the property of the Borough Council is commercially realisable, and could be set against the debt of the Council without impairing its ability to continue its public responsibilities. They pointed out that the Council could sell the electricity undertaking to a public company at a higher price than would cover the whole capital indebtedness of the undertaking and leave a substantial sum to credit. With respect to the second point, "that there is a limit to which local authorities should borrow money and thereby throw burdens on posterity, although each individual item of expenditure may be defensible," the Council state that they share the anxiety of the County Council to spend only such money as is really necessary in the public interest and in the discharge of the public and statutory functions of the Council, but the great expansion of Fulham made it necessary for the Fulham Council to take a larger view of its responsibilities and public undertakings than it would otherwise do, and consequently its schemes and outlook were of necessity greater than when dealing with a merely normal or stationary population.

Hove.—The Hove Electric Lighting Company, Limited, have asked the Town Council to support their scheme for the lighting of Aldrington. The following report has been adopted: "The General Purposes Committee forwarded a report from the Works and Improvements Committee with reference to applications for consent to construct underground works in connection with telephones. They mention that they had an interview with representatives of the Brighton Corporation Telephone Committee and have also been in correspondence with the town clerk of Brighton on the subject, with the result that the negotiations have been reduced to terms, the principal ones of which have already appeared in these columns. The committee recommended that the application of the Brighton Corporation be granted in so far as will enable them to have the sole use of the ducts above referred to for carrying telephone wires for the period named subject to an agreement being entered into at the cost of the Brighton Corporation, embodying the foregoing terms, and such further details as the Council might be advised by their solicitors as necessary. They also mentioned that in communicating with the Brighton Corporation it had been stipulated that the Hove Council were to be at liberty to grant a similar concession to any other authority, and the committee further stated that they were corresponding with the National Telephone Company in reference to proposals for an agreement to be entered into between them and the Hove Council enabling that company to carry wires underground. With one or two additions the General Purposes Committee recommended the Council to adopt this report."

Hereford.—The Electric Lighting Committee in their last report state that the results for the last financial year are somewhat more satisfactory than for the preceding 12 months. The surplus profits for 1901-2, after paying interest, amounted to £407. 10s. 6d., leaving £392. 9s. 6d. to be provided out of the rates towards the repayment of capital of £800. For 1902-3 the surplus profits amounted to £673. 7s. 5d.; the repayment of principal, including the new loan was £920, a balance of £246. 12s. 7d. thus falling upon the rates. The financial results of the undertaking for the year ended March 25, 1903, are as follows: Total units sold 108,815, as compared with 95,892 units sold in 1901-2. Of these there were charged 79,087 units at 6d. per unit, £1,977. 3s. 6d.; 16,126 at 4d., £268. 15s. 4d.; 7,437 at 3d., £92. 19s. 3d.; 6,165 at 2d., £51. 7s. 6d.—total, £2,390. 5s. 7d.; less rebates on corrrection of consumer's accounts, £1. 11s. 9d.—total, £2,388. 13s. 10d.; less discounts, £188. 4s. 9d.—£2,200. 9s. 1d.; meter rents, £104. 13s. 4d.; sundry receipts, £7. 0s. 4d.—total, £2,312. 2s. 9d. The working expenses for the year (including wages, salaries, oil, stores, coal, repairs, taxes, etc.) were £997. 2s. 9d.; interest, £641. 12s. 7d.—total, £1,638. 15s. 4d., leaving a profit towards repayment of capital (£920) of £673. 7s. 5d. The lamps connected and applied for at present to be served by the new cable amount to the equivalent of about 400 8-c.p. lamps. The committee have examined the estimate of income and expenditure on the electric light works for the current year as follows: estimated expenditure, £3,097; estimated income, £2,530—balance to be provided, £567. This £567 includes an estimated sum of £300 for overhauling and renewing batteries, but the committee have since the estimate was prepared made arrangements which they anticipate will largely reduce this outlay.

Redditch.—The electric light undertaking has up to the present cost £20,000. The original estimates provided for an expenditure of about half this amount, with the likelihood of a small profit from the commencement of working. The area originally estimated to be covered has, however, been considerably exceeded. The scheme has, so far, entailed an annual loss of over £1,000, and at a public meeting of ratepayers in March last it was decided that an expert should

Digitized by Google

be engaged to report upon the condition of the existing plant and machinery, and advise as to the future development of the undertaking. Subsequently Messrs. Burstall and Monkhouse, of London, made an inspection, and they have now reported that, in their opinion, an error of judgment was made in installing a high-tension alternating-current system. They say the continuous-current system would have been better, but the cost of changing the system from alternating to continuous would be now prohibitive. Of the four engines running at the station three were running satisfactorily, but the vertical engine was very unsatisfactory. The engineers note that the number of 8-c.p. lamps connected to the mains has steadily increased, especially since August of last year; also that there has been a steady decrease since 1901 in the "cost per unit sold." They are of opinion, however, that there is "room for further improvement in this direction." Not only is the consumption of fuel high, but the cost is too high. As regards the future prospects of the undertaking, it was evident that there had been many difficulties in the way of making the undertaking a commercial success. Now, however, these difficulties had been largely overcome, and, with the exception of one engine, the plant was in a better state than it had ever been. What the Council needed now was more customers. It has been decided to adopt several of the recommendations contained in the experts' report; other points contained in supplementary questions are to be settled at a conference to be held at an early date with the experts.

Workington.—Steps are being taken to obtain from the Board of Trade an extension or renewal of the provisional order for an additional two years. Mr. W. L. Eaglesfield has submitted to the Town Council the following report upon the practicability of employing the water of the River Derwent, or rather such part thereof as flows down the mill race, for the purpose of furnishing the necessary power required for working the generating station in connection with the proposed electric lighting scheme for the borough: "I find that the total fall of the bed of the race from the sluice at the Yearl to the bridge at the old sawmill at the head of the harbour is 16·96ft., and from the Yearl to the level of the River Derwent at the by-wash of the race at Workington Bridge is 11·46ft. The maximum fall which can be obtained for working the necessary turbines is only 13ft., and to obtain even this the bed of the race from the Yearl to Workington Bridge will require to be lowered to the level shown by the red line marked, between the points X to Y, on the section. The tail race, or that part of the race which conveys the water away after passing through the turbine, will discharge into the river at Workington Bridge, but the result of lowering the bed of the race will make it necessary to abandon the use of the race from Workington Bridge to the harbour. A wall would require to be built across the race at the Soapery to divert the tail water into the Derwent. From a gauging of the race on May 28 near the Hall Mill, at the point marked A B on the plan and section, the maximum velocity was found to be 2·4ft. per second, and the average velocity 2·01 per second. This gives a discharge of 2,624 cubic feet per minute, which, with a fall of 13ft., will furnish 49 effective horse-power. The minimum horse-power required to furnish the power requisite for lighting Workington will be about 800 h.p. Thus it will be seen that as the water at present coming down the mill race will only give 49 h.p., the source suggested will not furnish anything like the power wanted. In fact, the whole of the water coming down the river at the present date (June 23) would not yield probably more than 150 h.p. Of course the river is in an unusually low condition, but this is the state from which the calculations as to the power which can be relied upon should be obtained. I need hardly point out that great difficulties would present themselves if an attempt was made to divert for use the whole of the water flowing down the Derwent, owing to the several interests involved. After reviewing the results of the above I think you will see that the only course open is to obtain the power by the more prevalent method of steam."

Croydon.—The annual report of the Lighting and Electricity Committee is noted in another column. The committee are also considering a report presented by the borough electrical engineer on further extensions to buildings and plant as follows: "The scheme that I now have to submit is an inclusive one, arranged with a view to anticipating further extensions, and although it is not proposed at once to expend the money represented by the estimates which I now have to place before you, at the same time I have presented a complete scheme with a view to laying out the station and making provision for plant which will require to be installed within the next three years. Dealing with the engine-room plant, I have made provision in building capacity for additional machinery to the extent of about 3,000 h.p., and the proportion which I would suggest be installed before the winter of 1904 is two-thirds of this amount, or two sets of 1,000 h.p. each. One of these would be for the supply of direct current for lighting and tramways, and the other would be for the supply of alternating current for lighting only. In connection with the engine-room plant, I have also included in my estimate for substituting a new engine for that removed from No. 2 generator to drive the two continuous-current balancers. Provision has been made in the condenser house now being erected for condensing plant to deal with 4,000 h.p., which will work in conjunction with two of the generating sets included in the present estimate. A corresponding further addition should be made to the condensing plant to work in conjunction with the third set included in this estimate. This will not be required until the winter of 1906. A further installation of boilers will be required for the winter of 1904, and I would suggest that two boilers of the same capacity as those at present being installed—viz., an evaporative capacity of 12,000lb. of water per hour each—be erected in the boiler-house. The present extension of the boiler-house will be sufficient to house six boilers of this capacity, which will be ample to cope with the estimated load of 1906. I have included in my estimate in connection with the boiler-house provision for a conveyor plant and coal bunkers, and I desire that it should be clearly understood that the question of coal storage is one that must have attention, regardless of any considerations connected with mechanical stokers, railway siding, or other matters. It has been our practice hitherto to stack coal in the adjoining ground for six months in each year, and not only does this involve extra labour, but it also involves very serious depreciation in the calorific value of the fuel. It must be borne in mind, further, that within a comparatively short time the ground at present used will not be available for this purpose, buildings having been erected thereon; and if provision be not made at the present time for coal storage it will be very much more difficult to deal with the matter when, in a few years' time, it becomes necessary, as undoubtedly it will. Having realised the necessity for making provision for coal storage, the question to be considered is, Which is the most convenient method of doing so? The system of storage by means of overhead bunkers is, in my opinion, undoubtedly the most convenient and the one attended with the greatest efficiency. In conjunction with this scheme, I have also included the cost of the railway siding. The estimate is as follows: engine-room and boiler-house extensions, including stanchions for carrying coal bunkers and stanchions for overhead crane in engine-room (as per estimate by the deputy borough engineer), £15,000; six boilers, each capable of evaporating 12,000lb. of water per hour, £8,400; foundations and flues required in connection therewith, £2,400; filtration plant for hot-well water (including erection), £450; two feed pumps for boilers, £350; economiser, £1,200; coal conveyor plant and bunkers, £3,600; two 1,000-h.p. generating sets for alternating current, £14,000; one 1,000-h.p. generating set for continuous current, £7,000; foundations in connection with the above and also condensing plant, £1,350; condensing plant for the above, including new cooling tower, £3,500; one engine for No. 2 generator, £700; switchboard extensions, switchgear, instruments, cables, etc., £500; pipework, steam, exhaust, and drain pipes, £1,500; one 100-kw. 5,000-volt transformer, with switchboard, cables, etc., £350; railway siding, £4,200; contingencies (10 per cent.), £6,450—total, £70,950. The estimate set forth in the above list represents for the most part capital expenditure on buildings, machinery, and plant, the necessity of which has from time to time been impressed upon the committee. These will consist of simply an extension of the station on the same lines as hitherto in order to meet existing and future demands and provide for proper stand-by. A considerable expense, however, is represented by the two items—coal-conveyor plant and bunkers and railway siding—amounting in all to £7,800. In justification of this expenditure, I would point out that in addition to making the necessary provision for coal storage, the amount paid per annum for cartage from the coal depôt to our works—viz., £625—an amount which is continually increasing as years go on, exceeds the amount represented by interest and sinking fund on the capital cost of £7,800, which would only amount to £468. The saving in future years would be considerably greater, and I submit this scheme having given consideration to the benefits of the future as well as to present requirements. The committee recommend that the foregoing report and estimate be adopted; that application be made to the Local Government Board for sanction to the borrowing of £70,950, and that in the event of the sanction being granted it be referred to the Finance Committee to raise the necessary loan." The electrical engineer also reported as follows: Mains and sub-stations—Extension of mains St. James's-road to West Croydon Hall, 80 yards; extension of mains from Sydenham-road North to 203, St. James-road, 160 yards. The necessary alterations are being carried out in Station-road sub-station for the change over to direct current. Current sold, 1903: private lighting, 73,199 units; public lighting, 37,849 units; traction, 94,913 units.

PROVISIONAL PATENTS, 1903.

JULY 6.

14913. Improvements in electric arc lamps. Edwin Joseph Murphy and Arthur Townsend, 83, Cannon-street, London.

14946. A device for indicating or preventing the exceeding of specified speeds on dynamos, motorcars, and the like. Ernst Neuberg, 77, Colmore-row, Birmingham. (Complete specification.)

14963. An improved electric furnace. Percy Richard Julius Willis, Fife House, Kingston-on-Thames. (Ernst Adolf Sjosted, Canada.)

14979. Improvements in electricity meters. Herman Aron, 47, Lincoln's-inn-fields, London. (Complete specification.)

14980. Improvements in electricity meters. Herman Aron, 47, Lincoln's inn-fields, London. (Complete specification.)

14994. Improvements in or relating to a process and apparatus for obtaining a continuous electric current from a high-tension alternating-current source. Alfred Julius Boult, 111, Hatton-garden, London. (Franz Joseph Koch, jun., Germany.) (Complete specification.)

JULY 7.

15048. Electric signalling apparatus for railway trains. Arthur Bonemeyer, 115, Cannon-street, London. (Complete specification.)

15050. Improvements in or relating to the manufacture of galvanic batteries. William Phillips Thompson, 6, Lord-street, Liverpool.

15059. Improvements in electrical hauling apparatus. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens and Halske Actien-Gesellschaft, Germany.) (Complete specification.)

Digitized by Google

15065. Improvements in keyboard telegraphic transmitters. Maximilien Kotyra, 46, Lincoln's-inn-fields, London. (Complete specification.)

15076. Improvements in circuit make and break apparatus for electric induction coils. Lucien Legoy, 115, Cannon-street, London.

15077. Improvements in apparatus for telephone exchanges. Albert Parker Hanson, Norfolk House, Norfolk-street, Strand, London. (Date applied for under Patents Act, 1901, July 7, 1902, being date of application in United States.) (Complete specification.)

JULY 8.

15069. Improvements in electrically lit signboards and the like. George Smith, 57, Barton-arcade, Manchester.

15090. Improvements in insulators for electric telegraph, telephone, and other line construction. Charles Adams Randall, 56, Digby-mansions, Hammersmith, London.

JULY 9.

15186. An automatic electric welding machine. Sebastian Ziani de Ferranti, 18, Southampton-buildings, Chancery-lane, London.

15199. Improvements in induction coils for the ignition apparatus for motors. Marconi's Wireless Telegraph Company, Limited, Sidney Walter Ashley, and Karl Alfred Hinde, 24, Southampton-buildings, Chancery-lane, London.

15217. Improvements in apparatus for varying electrical resistance. George Lewis Hogan, 27, Chancery-lane, London.

15218. An improvement in or relating to electric cut-outs, contact breakers, meters, and similar electrical apparatus. Hugh Swanton, 70, Chancery-lane, London.

JULY 10.

15242. Improvements in means for automatically regulating electric currents generated by dynamos. Stephen Watkins, Prince's Chambers, Wolverhampton. (The Consolidated Railway Electric Lighting and Equipment Company, United States.)

15247. Improvements in electric incandescent lamp holders. Henry Mostyn Darrah and Lewis Arthur Hackett, 55, Market-street, Manchester.

15257. Improved means for operating the rail and condition points in electric tramway or railways. William Millar, 62, St. Vincent-street, Glasgow.

15266. Improvements in electrical switches. Charles Mark Dorman and Reginald Arthur Smith, Ordsal Electrical Works, Salford. (Complete specification.)

15286. Improvement in staples for use in electrical installations. Harry Richards and George Davis, 23, Coleman-street, London.

15317. Improved construction of apparatus for the electro-deposition of metals. John Henry Collis, Alfred Collis, and Walter Head, 173, Fleet-street, London.

15337. Improvements in magneto-electric igniting apparatus. Willy Roos, 115, Cannon-street, London. (Complete specification.)

15338. Improvements in magneto-electric igniting apparatus. Willy Roos, 115, Cannon-street, London. (Complete specification.)

JULY 11.

15345. Improvements in electric sparking plugs for igniting in spirit, gas, or oil engines. Henry James Cranfield, Faraday House, Avenue-road, Erith, Kent.

15364. Improvements in bars for protecting the openings in electric lift cars. William Sprowson, 21, Spring-gardens, Manchester.

15366. Improvements in electric safety fuses. David Martin, 11, Burlington-chambers, New-street, Birmingham.

15369. Improvements in and relating to the operating cords of the trolley arms of electric tramways. Abraham Taylor, William Moorehead, and Thomas Henry Kingscote, 55, Market-street, Manchester.

15403. Improvements in and relating to electric circuit controlling apparatus. Charles Cornfield Garrard and Ferranti Limited, 18, Southampton-buildings, Chancery-lane, London.

15420. Process for the electrolytic production of zinc. Karl Kaiser, 27, Chancery-lane, London. (Complete specification.)

COMPLETE SPECIFICATIONS ACCEPTED.

To be published July 30, 1903.

1902.

12900. Electrical conductors. Lake. (General Electric Company.)

15334. Conduits for electric or other cables. Cummings.

15470. Clip for electric lamp shades, candle shades, and the like. Holdgate and Commin.

15714. Electrical fuse-boxes or cut-outs. Burnet.

15764. Control of electric lifts. Stevens, Major, Stevens, and Stevens.

15795. Means for transmitting electricity to vehicles on electric railways. Beer.

17196. Electrical resistance devices specially applicable to electric heaters. Waterhouse.

17466. Electrodes for electric arc lamps. Blondel.

18087. Alternating electric current generators. British Thomson-Houston Company, Limited. (Reist.)

THE DESIGN OF EXTRA HIGH TENSION SWITCHGEARS.

BY W. E. WARRILOW.

(Continued from page 10.)

The Oerlikon Company are inclined to favour the assembly of this design of switch in pillar form, as

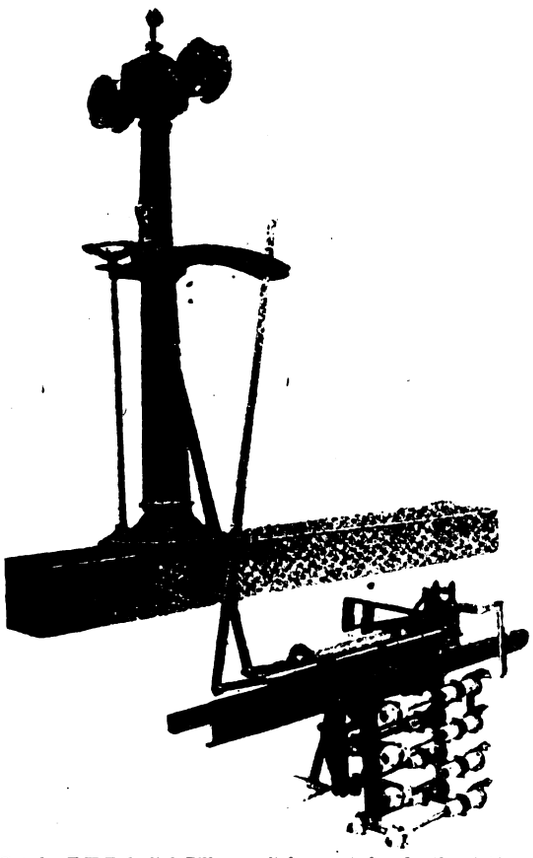

FIG. 4.—E.H.T. Switch Pillar; switch mounted under the platform (Oerlikon Co.).

Fig. 4 shows, and where galleries are available it makes a compact arrangement as far as the devices themselves are concerned, the principal trouble arising when the connections have to be considered. When it is required to operate the switch automatically, the same principle of breaking the circuit is employed, but a tripping solenoid (Fig. 5) is fitted, which actuates a motion connected to the main lever, this serving to withdraw the plungers from the tubes and open the circuit. It is interesting to note that no divisions are inserted between the contacts in any case, and this would tend to point to the confidence the makers have in the capabilities of the device. For very high potentials the switches are mounted high above the operating platform, as shown in Fig. 6, where the complete gear for a 30,000-volt installation can be seen, including transformers, connecting wires, and switch. This is well out of reach, but for the pressure employed the conductors seem very close together compared with some types of gear for lower voltages. The manner of assembly of one of these boards can be gathered from

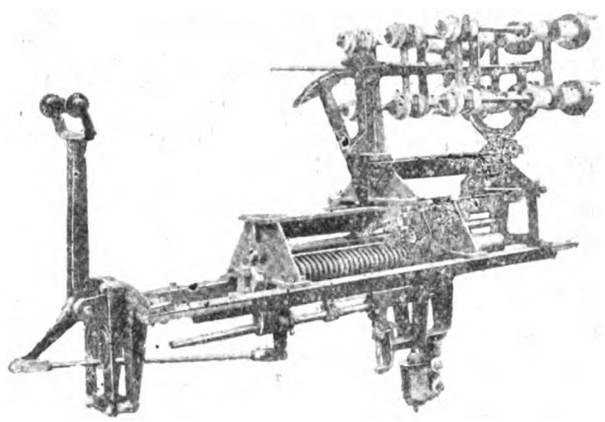

FIG. 5.—E.H.T. Switch, with Tripping Device (Oerlikon Co.).

Fig. 7, which clearly shows the mounting of the switches and their operating levers. All conductors are supported on porcelain insulators fixed to the iron framework which makes up the skeleton of the gear, and great care is taken in the running of all connections to ensure absolute safety from short-circuit, though the attendant may not be so immune from danger as would be supposed at first sight when the front of the gear is examined.

An oil break fuse by the same company, suitable for dealing with pressures up to 10,000 volts, is illustrated in Fig. 8, this indicating the complete device in its terminals. It is designed for bolting up in the most convenient position on the board, and cable terminals are provided above the insulators for connecting purposes. The fuse proper comprises a porcelain tube with clip contacts at each end, the

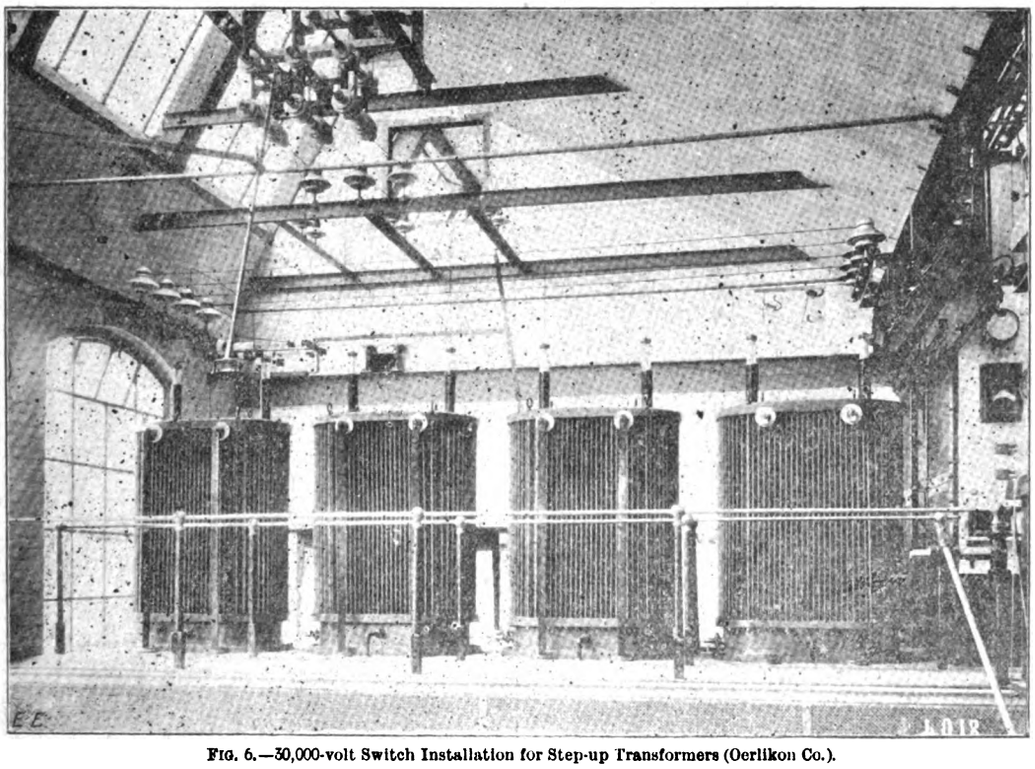

FIG. 6.—30,000-volt Switch Installation for Step-up Transformers (Oerlikon Co.).

Digitized by Google

lower one being fitted with hinge pins, which enable the fuse to be used as a switch for closing the circuit. The fuse wire is stretched between the top and bottom terminals, the arc on opening circuit being quenched by the oil in the tube. A similar device, but for a 20,000-volt circuit, is represented in Fig. 9, the principal difference noticeable being in the creeping surface of the insulators.

the re-fusing of the holder, the binding screws being exposed on the withdrawal of the cap. Upon fusion of the wire, the vapours given off by the combustion of the metal cause the expulsion of the carbon balls into the cavities, A, thus sealing the ends of the tube and cutting off the arc. The gases arising from fusion pass out of the holder by way of perforations at the end of the barrel,

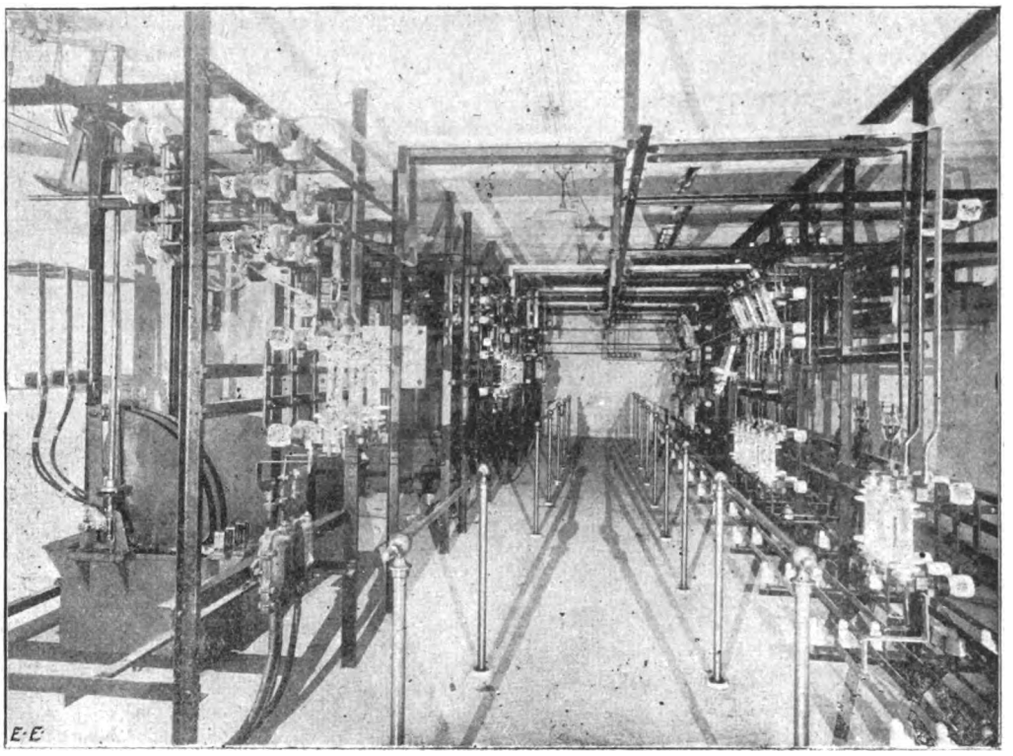

FIG. 7.—Back View of E.H.T. Gear, showing Mounting of Switches (Oerlikon Co.).

The designs above described meet with considerable favour on the Continent, and are in extended operation there on some very large schemes, giving, according to the makers, every satisfaction. With such designs, the space occupied per kilowatt controlled is apt to be rather large, as the various devices are fixed in the most convenient positions on the iron framework, quite apart from any consideration of ease in operation or economy in attendance. The connections also tax the ingenuity of the electrician to arrange neatly and safely, though these items have not in any way proved obstacles to the employment of the gear.

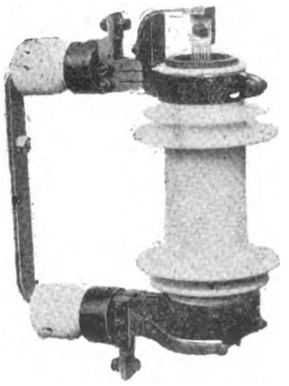

FIG. 8.—E.H.T. Fuse, 10,000 volts (Oerlikon Co.).

An interesting form of enclosed air break fuse, made by the Stanley Company, of America, is shown in Fig. 10. This is known as the "ball" fuse, and is employed on pressures up to 30,000 volts with every success. The device is made up in plug-handle form, and the two views in Fig 10 show sections through the fuse before and after blowing. Referring to the figure, C is a chamber containing a small carbon ball, B, which permits of the passage of the fuse wire into the tube, F, to the opposite end of the handle, which is also provided with a similar chamber and ball. Clamping washers are fixed to terminals at each end, and over these the cap and contact jaw, G, make a tight fit. A slight twist of this cap permits of its removal for

the top end being provided with a small aluminium vane, which is puffed up from a horizontal position to a vertical one where it can be seen by the attendant, indicating to him that the fuse has blown. This device has been submitted to very severe tests by the makers, and is stated by them to have continually broken successfully a 30,000-volt circuit of 50 amperes capacity. It is fitted to the

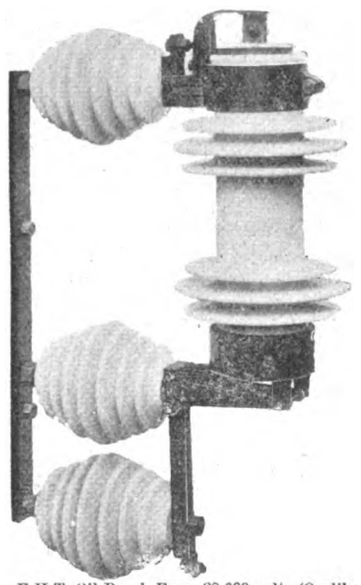

FIG. 9.—E.H.T. Oil-Break Fuse, 20,000 volts (Oerlikon Co.).

front of gears, and the connections for insulated cable are at the back of the supporting slab. For 20,000-volt circuits the length of the fuse tube is 21½in., and for isolated use this would be mounted on a marble base 28½in. by 26½in. In all the switchgears which this company make, the connections and the majority of the actual apparatus are all arranged behind marble slabs fixed in an iron framework. This type of board seems to have come into common use in America, and as a consequence the wholesale standardisation of apparatus has been possible, the firm in question

Digitized by Google

having a series of designs which can be employed for a great variety of purposes.

The oil switch is made use of for heavy currents at high voltages, and a design which meets a number of conditions is shown in Fig. 11, this being a section through a three-pole switch, or it may be employed as three series switches for extra high voltages. The contacts are mounted on marble slabs forming the lid to a tank which is filled with oil, and which can be lowered without disturbing the connections. The operating mechanism is also fitted to the top slab, and the entire combination is linked up by a number of rods terminating in a lever projecting from the front of the gear. The moving element of each switch comprises a metal arm pivoted about three-fourths down its length, the longer portion being tipped with hard wood into which the connecting blade is fixed. This is zinc tipped, and merely serves the purpose of closing the circuit through two fixed contacts, and when the switch is open it forms no part of the line whatever. For triple-pole work or series switches the arms are all linked up to a common bar, upon which the main operating rod is mounted. The terminals, which provide for the reception of cable connections, are covered by small cherrywood boxes, which protect them from being touched when charged. Each combination has its own tank, and this has the advantage of being oiltight, as there are no joints under oil, and no part of the mechanism is connected with the tank in any way.

ELECTRIC TRACTION ON RAILWAYS.

At the recent engineering conference of the Institution of Civil Engineers the two following papers were read in Section VII. and were discussed together :

High-Speed Electric Traction on Railways.

BY J. W. JACOMB-HOOD, M.I.C.E.

The introduction of this subject would appear to be the duty of an electrical specialist, but inasmuch as the difficulties are to a large extent practical, the notes of a mere general practitioner in railway work may be acceptable. The problem thus offered for discussion must first be defined. It must not be confounded with the problems in short distance and omnibus traffic that have alone been dealt with hitherto in this country, nor must existing practice under steam be allowed to limit the imagination as to possibilities of service by electricity. As the question develops, it becomes clear, in the first place, that the existing adaptations of electricity to traction are not altogether suitable for general railway business, including economical high-speed services; and, further, it is practically certain that the substitution of electricity for steam as a vehicle of power will of itself produce a change of general ideas and of general methods.

Digitized by Google

The term "high-speed electrical services" may be defined as representing frequent communication, without intermediate stops, between busy centres that are widely separated. The speed expected will certainly not be less than 60 miles an hour, and the cost of service per ton per mile must not be more than that of existing steam services. Means that are adopted for such high-speed services must be equally available for a modified stopping service, as well as for freight and shunting services, because it is inconceivable that railway companies will be tempted to electrify their lines for their high-speed services alone, and there must be no interference with the free use of lines by steam locomotives.

As some slight indication of the amount of work done by railways to-day, a diagram of actual services performed on a typical section of line, about 80 miles in length, on one of the busiest days of last year, is exhibited. Assuming fixed average loads for the various classes of service, the total train resistance has been calculated and plotted as a load curve. This will give a good general idea of the bulk of the business that electricity may some day be called upon to undertake. It will be seen that the peak of the load occurs before mid-day, and involves a consumption of energy estimated at 661 millions of foot-pounds per minute, or very nearly the equivalent of 26,500 h.p., or 19,800 kw. The high-speed trains—defined as those travelling at a speed of 40 miles an hour and over—are marked on the diagram on the wall by thick lines. This class of traffic is practically confined to the hours between seven o'clock in the morning and eleven o'clock at night, and the load curve is seen to be affected in consequence, but the proportion of high-speed trains to the total service throughout the 24 hours is only as 1 to 3.

It would be well if discussion on this subject were to avoid any general comparison of steam and electrical railway services, for while the advantages of electrical service are admittedly considerable for many conditions of traffic, a wholesale conversion of steam services is so difficult a financial problem as to be practically impossible, even if proved desirable. It may be granted that conversion, in the case of services where electricity can with certainty compete economically with steam, will come; and that any new railways, built to connect large centres of traffic with a high-speed service, will, without much doubt, be equipped electrically, and the time at the disposal of the conference will, therefore, be spent to the best advantage if the leading features of an electrical equipment that will meet the needs of high-speed and general services are alone kept in view. Above all things, it seems to be essential that as railway companies must for the public benefit continue to exchange rolling-stock, the principles of any system must be acceptable to the whole body of railways before they can be adopted. The ground for discussion being thus limited, the subject divides itself conveniently as follows: (*a*) generation; (*b*) consumption; and (*c*) transmission, distribution, and collection of current.

Generation of Current.—Of all the vital questions connected with power stations, perhaps none is more important, although diverse opinions have been expressed, than the economical limits of size of steam or gas generating sets. In this country one or other would be, in nearly all cases, the only alternatives. The possible positions of generating stations relative to the railway will frequently decide cases; but, assuming that the power capacity of stations will, on occasion, be determined chiefly by the limit of economy in generation, it is important that the subject of the most desirable maximum sizes of steam or gas sets for power stations should be well ventilated. After taking account of the increased cost and losses in extended transmission lines, reason would seem to dictate that the power stations should be as widely separated and as few in number as possible, to ensure a steadier load and a better load factor. Power-station practice is rapidly becoming standardised in detail, so that it can be foreseen with some confidence that moderate-speed engines, directly coupled to alternators generating in single or multiphase form at tensions as high as circumstances allow, will be used. An economy in every detail will have to be studied, it may be that gas-engines in connection with a producer plant will prove the ultimate solution.

Consumption of Current.—Without invading the territory of the electrical engineer it is possible to bring forward one point of practical importance in connection with motor design. The practice of to-day seems to be almost universally in favour of a direct-current series-wound motor, with automatic field regulation, which will run economically at any speed up to a maximum. On the other hand, there is the alternative, with some economical advantages to recommend it, of a system that involves the use of smaller high-tension currents, used in alternating single or multiphase motors, that are limited to one or, at most, two economical speeds. Opinions differ widely as to the class of traffic for which invariable speeds are suited; and it must be confessed that it is extremely difficult to foresee the effect that invariable speed would have upon the conduct of general railway business. It is, however, tolerably clear that for any class of business variable speed is to be preferred. Such points as the position and individual power of motors are all interesting, but inasmuch as motors arranged on a multiple-unit system to ensure minimum train weight and maximum weight available for adhesion, will almost certainly be employed for high-speed railway service, whilst electric locomotives of high power capacity for freight, shunting, and other general business will also be required in the railway business of the future, time need not be employed in discussing them.

Transmission, Distribution, and Collection of Current.—The principles of generation and consumption of current being determined, systems of transmission, distribution, and collection must to a large extent follow. But it is here that the practical difficulties present themselves most formidably to the railway man. With all the complications due to dense traffic within a very limited construction gauge, and with the imperative need of safeguarding life and limb, it is difficult to see how any system of distribution is to be carried out without serious objection. This part of the problem needs the fullest consideration that the conference can give. Transmission, perhaps, has the fewest difficulties. In view of the urgent need for economy in first cost, it is to be hoped that we may in time accept the Continental methods of using bare overhead transmision lines for carrying current at high voltage rather than incur the heavier expense of cables.

So far as existing practice is a guide, a system of distribution to feed a third conductor rail will appear to meet the needs of the case. There are in existence cases of railways where large currents are being collected from a third rail at speeds approaching 50 miles an hour, and experiments in this direction indicate that still larger currents than these can be taken at speeds up to 70 miles an hour. But the existence of a third rail at all, in any position, introduces troubles in the upkeep of the road and in other directions that are better avoided if possible. An overhead conductor system would probably be less unwelcome to the maintenance engineer, and from some points of view it has advantages over any ground collecting system. But here, again, if the system is one of high-tension triphase current, the duplication of conductors presents another difficulty.

It will be interesting to watch the developments in the United States of the experiments about to be made with single-phase alternating currents, involving only one overhead conductor. The difficulties in the way of collecting a comparatively heavy current from an overhead equipment appear to have been to some extent overcome on one of the North Italian railways, and developments in this direction may be of assistance. Systems that have been advocated of collection from the primary conductor for use in a motor-generator on a locomotive seem attractive, and inasmuch as they would do away with sub-station difficulties and expenditure, the problem may thus be solved. Inasmuch as pure accumulator systems, although they may be useful and economical for light branch services, are not thought to have any promise for heavy general railway work, no further mention of them seems called for.

In these notes the author has attempted to put forward in the briefest possible manner some of the main points

Digitized by Google

that demand the consideration of all who are interested in this important subject.

The Position and Protection of the Third Rail on Electric Railways.

BY WILLIAM E. LANGDON.

In view of the fact that modern arrangements now propose to provide a "return" rail, independent of the track or wheel rails, it would, perhaps, have been more correct if the title of this paper had been "the position and protection of the conductor rails." It will, however, I hope, be quite understood that the consideration of the subject embraces the provision of both the third and fourth rail. By the third rail is meant that rail which conveys the current to the motor, and by the fourth that which returns it to the generator; and in order to avoid confusion of terms it is hoped it may be found convenient to regard the rails which carry the traffic as the *wheel* rails, and those which convey the electric current as the *conductor* rails.

There is ample evidence that we have now arrived at a period when surface lines of railway—lines of ordinary construction for steam haulage—have to be considered in relation to their operation by electrical agency. Tube lines will no doubt, where they have means for doing so, form connection with near surface lines for the purpose of ready interchange of traffic. And when to this we add that it is understood all of the main lines are considering the propriety of electrically working portions of their systems, the question of arriving at a decision as to the position of the conductor rail is, in the interest of all, most desirable, for whether the equipment of trunk lines is for a long or a short time deferred, there can be little doubt that what may be termed the residential lines will seek to avail themselves of the advantages to be obtained from electric traction, and as many of these may intersect one another, a recognised standard will become an absolute necessity.

Conductor Rail.—There appears to be no uniformity of practice in determining the position of the conductor rail. This, so far as this country is concerned, is probably to be accounted for by the fact that the progress of electrically-driven railways has been mainly confined to underground routes, the only exception being that of the Liverpool Overhead Railway, a line which, although exposed or open to climatic influences, is inaccessible to trespassers, and free from other inconveniences common to the ordinary surface railway. The practice with the earlier lines operated by electricity has been to lay the third rail between the wheel rails, and to employ the wheel rails, duly bonded, to form the return conductor. For the Mersey Tunnel, the Metropolitan District, Metropolitan, and other electrical lines, in contemplation or under construction, an insulated rail is used for the "return." The potential conductor is placed at a given distance outside the wheel rails, and the return rail between them. It is considered that this practice—viz., the provision of an insulated, or, at all events, of an independent return rail—will be found in future constructions. The object in thus employing conductors independent of the wheel metals will be obvious. It avoids any interference therewith, and ensures, as far as possible, perfect continuity. It will also be helpful in preventing trouble with the telegraph service. In all instances the conductors are, whether insulated or not, laid upon the sleepers which serve the wheel rails, and this appears to be the practice in America as well as here; but in the States, where the sleeper employed is not so long as those used in this country, every fifth one, or thereabout, is made longer for the purpose of providing for the support for the third rail. By the courtesy of the British Westinghouse Company I am enabled to furnish the appended details of the position of the conductor in relation to the wheel rail on lines in the United States, as also a scale drawing (Fig. 1), showing the position of the positive and negative conductor rails as adopted by that company. From this list and from other data, it is clear that the only uniformity attained is that all alike make use of the sleepers which carry the wheel rails for the support of the conductor rail or rails, as the case may be. The object, no doubt, is to secure parallel conditions between the different sets of rails.

Protection of Conductor Rail.—There is, of course, no absolute necessity for the protection of the return conductor, but for the third rail—viz., that which forms the potential conductor—protection is desirable, and has in some instances been provided. This protection usually consists of a vertically-arranged plank on one or both sides of the rail, as shown on one side only in Fig. 1, the upper edge of the plank being somewhat higher than the top surface of the rail, so that anything falling across it may not form contact with the conductor. It is suggested that this affords no protection from weather, and but an imperfect protection against accidental contact. The conditions that will attend surface lines are very different from those which will apply to tube lines, or lines which are not open to trespassers. Climatic conditions will be found to be far more troublesome. Snow, rain, and fog are enemies which

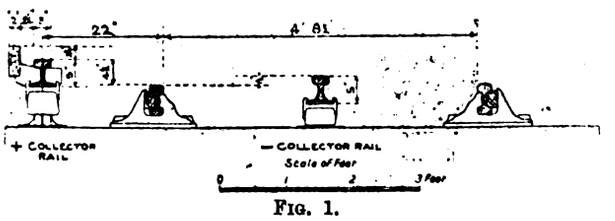

FIG. 1.

have little, if any, effect upon a covered line. It would, therefore, appear desirable that the most complete protection of the conductor rail, both with respect to climatic effect and accidental or intentional interference, should be provided for. This, it is thought, may be better obtained by adopting a roof cover as shown in Fig. 2, the roof extending so far beyond a vertical line drawn from the edge of the rail as would prevent a person standing against it, or an implement placed against it, from touching the conductor. We have to bear in mind that workmen will, in the discharge of their duties, be frequently moving about in the immediate neighbourhood of the conductor, and that such a guard as that suggested would unquestionably be more effectual than the vertical planks which leave the top of the rail exposed.

Points for Consideration.—Two important questions present themselves—viz.: (1) the distance which should supervene between the near wheel rail and the conductor or between the latter and the return rail; and (2) whether the sleepers which carry the wheel rails should be used for the conductor rails. It is probable that the first of these two important questions will only be determined

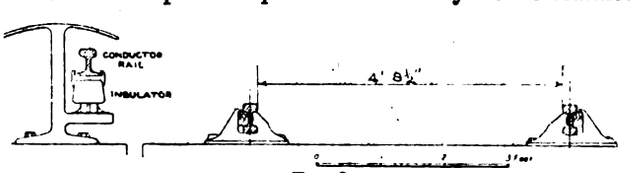

FIG. 2

after experience of the climatic effects to which they will be exposed has been obtained. With respect to the second question, however, the subject can at once be considered, and no better opportunity than the present could arise, when it may be expected that engineers of permanent way are present. In considering it we have to bear in mind: (*a*) that the permanent way must be constantly patrolled; (*b*) that packing and drainage of the sleepers are essentially an everyday occurrence; (*c*) that renewals of sleepers and rails, replacement of defective sleepers, broken chairs, etc., must be provided for; (*d*) that when laying out stores for any of these works the off-side of the line is almost invariably used; (*e*) that the off-side of the line is also used by workmen and others when walking the line.

All these conditions, it is thought, suggest the propriety of confining the conductor rails to the "six-foot," and dissociating them entirely from the sleepers which carry the wheel rails. This would, inasmuch as structures would at points narrow the space, and for other reasons, necessitate the use of a flexible collector, which ought not, however, to prove an insurmountable obstacle. It would also

Digitized by Google

entail, where a fourth rail is employed, the provision in the 6ft. space of a structure which would accommodate both the potential and the return rail, either vertically, one above the other, or on practically the same level—side by side. It is evident this would prove more complicated than the provision shown in Fig. 1, but it is also clear that it would be largely to the convenience of the electrical as well as the permanent-way engineer, and that it would aid each in the effectual maintenance of their respective responsibilities. It would also claim consideration in dealing with crossings. With a multiple-unit train no trouble would arise, but with a train worked by a locomotive it would be necessary to supplement the *collectors* on the locomotive by *collectors* on the next vehicle, which would ordinarily be the guard's van or brake.

APPENDIX.—PLANTS ALREADY INSTALLED.

The following table gives the location of the positive collector rail where electric traction has already been installed on a number of main-line steam railways, and interurban, elevated, and underground electric railways. In Column A the distance is from top of positive rail to top of track rail; and in Column B from track gauge line to centre of positive rail.

Main-Line Railways, Electric and Steam Service.

	A. Inches.	B. Inches.
Baltimore and Ohio Railroad, Baltimore, Maryland (old location)	1¾	24
Baltimore and Ohio Railroad, Baltimore, Maryland (new location)	3½	30
Albany and Hudson Railroad, New York	6	27
New York, New Haven, and Hartford Railroad, Connecticut	1½	Centre.
Paris-Orleans Railway, France	7⅞	25⅝
Gallaratte, Italy	7½	26⅝
Mersey Railway, Liverpool	4½	22
North-Eastern Railway, Newcastle	—	—
Lancashire and Yorkshire Railway, Liverpool	—	—

Interurban Railways, Electric Service Only.

Aurora, Elgin, and Chicago, Illinois	6⅝	20⅛
Columbus, Buck. Lake, and Newark, Ohio	6	27
Columbus, London, and Springfield, Ohio	6	27
Lackawanna and Wyoming Valley, Pennsylvania	6	20⅜
Grand Haven, Grand Rapids, and Muskegon, Michigan	6	20⅜

Elevated and Underground Electric Railways.

Metropolitan West Side Elevated Railway of Chicago, Illinois	6¼	20⅛
Lake Street Elevated, Chicago, Illinois	6½	20½
South Side Elevated Railway, Chicago, Illinois	6¾	20⅛
North-Western Elevated Railway, Chicago, Illinois	6½	20½
Brooklyn Elevated Railway, Brooklyn, New York	6	22
King's County Elevated Railway, Brooklyn, New York	5¼	19½
Manhattan Railway, New York	7½	20¾
Rapid Transit Subway, New York	4½	22
Central London Railway, London	1½	Centre.
Liverpool Overhead Railway	1½	Centre.

It will be noted that there is a wide variation in the dimensions, but in general the main-line steam railways of America and the Continent have found it necessary to place the rail at a greater distance than 24in. from the gauge line. This is due to the width of steam locomotives and heavy goods cars, and to the specially long and low double-bogie stock for transporting bulky apparatus and machinery, such as car bodies, flywheels, generator frames, etc.

DISCUSSION.

Mr. Langdon said at the time he presented his paper he was not aware that some meetings had been held by the railway companies, and that practically some agreement had been arrived at as to the position in which the conductor rail should be placed, and he understood that the decision come to was that these conductor rails should be placed upon the sleepers, the same as had been done in other countries. He could not, personally, help thinking that there would be found a greater convenience in carrying out the permanent-way duties with four rails being placed together on the same sleepers, and he would urge the desirability of their being placed quite independent of the wheel rails.

Mr. Aspinall said the position of the third rail was a question of very great importance, and it was one that had been discussed at three meetings which were held by the railway companies at the Railway Clearing House with a view of arriving at a standard position which they could all agree on. The difficulty, however, of adopting the dimensions in the diagram shown in the paper was that they were dealing with existing railways, which had all sorts of obstructions in the way, and all these had to be considered. Another point was that it was desired to get the third rail, or the live rail, upon the existing sleepers in order to save the expense of putting in additional new sleepers, and it was desirable to have that at such a point that the insulator could be properly fixed upon that sleeper. It would be possible, according to the diagram, to go out a little bit beyond that—perhaps an inch or more—but all sleepers were not exactly a standard length, and they would not be able to get the insulator well bedded upon the sleeper. It was decided at the railway conference to place the third rail 3ft. 11½in. from the centre line of of track. He spoke of it as from the centre line of the track, because that was more or less a variable figure. It was also decided that the third rail should stand up 3in. above the track rail; and, further, that if it became necessary to put any protection bars they should be put 8in. apart. The dimensions practically accepted by the conference were 3ft. 11½in. centre line of rails, 3in. high for live rail, and 8in. apart for protecting bars. They must keep the rail a fair distance above the track, because the shoes must pass over any crossings in complicated existing crossings of rails, and they would of necessity have a certain amount of spring in order to keep them in contact with that rail, and they must, further, allow for the rise and fall of the vehicles due to their springs and the wear and tear of the tyres which was always taking place.

Mr. A. P. Trotter (electric adviser to the Board of Trade) said Mr. Hood's paper should prove of great interest to those who were looking forward to the equipping of the main-line railways for high speed, but they had to walk before they could run, and no doubt the smaller lines would be the first to be worked electrically. Mr. Langdon spoke of an insulated rail. Engineers would have to settle for themselves whether they found it worth while to put an insulated rail for the "return." Experience only could show what degree of insulation was arrived at for the return rail, and what difficulties were likely to arise from leakage. With regard to the question of trespassers upon the line, he fancied that point largely determined the desirability for guard rail. The hood over the conductor rail appeared to be difficult to realise on account of the load coach.

Mr. Portheim said Mr. Trotter had remarked that they must walk before they ran. In this country he thought they walked rather too much, and gave the public too much evidence of walking whilst they were trying to run. Mr. Hood's paper referred to the variation in speed on the three-phase overhead system. There was no difficulty as regards variation of speed if they had them in multiples. The great plea in favour of the overhead system, which must appeal to everybody, especially financiers whose object was to find money for the lines, was the cost.

Mr. Ross said he, personally, should like to get the conductor rail off the permanent way, and if it could not be put in the six-foot he should prefer that, instead of being on the sleepers, it would be on standards immediately between the sleepers, with a regulating screw or something with which they could keep the relative levels. He did not see how the difficulty of the roof cover for the rail could be got over. It was most desirable that it should have a cover. He was rather disappointed that the authors did not refer to the subject of capacity.

Mr. Worthington said, with regard to the point as to whether the electrical appliances should be fixed on the same sleeper as the running rail, he thought the advantage was in favour of putting the whole thing on one sleeper if you could be sure that the sleeper always kept at its level; but sleepers would go up and down. If they did not have a bar rail attached to the sleeper, they would have a varying depth over which the sleeper would have to rise and fall. Of course, it would not be a very large amount. It would be a great advantage that the two rails should rise and fall together. With regard to an insulated fourth rail, it would enormously complicate the difficulties in points and crossings if they had got a rail in the four-foot standing up 1½in. above the surface of the running rails, especially when they considered the rise and fall of the carriages on their springs. There was a very narrow margin to be left between the sleeper and the running rail when the electrical train was running on a worn rail, and he could not help thinking that would create a difficulty.

Mr. Fletcher, Mr. Winder, Mr. F. Fox, Major-General Webber, Mr. Gates, Mr. Roger Smith, Mr. Scott, and Mr. Cottrell also spoke, and the authors having replied, a hearty vote of thanks was passed.

CHLORINE SMELTING, WITH ELECTROLYSIS.*

BY JAMES SWINBURNE, VICE-PRESIDENT.

ARGUMENT.

Chlorine smelting, a new process covering wide domain in metallurgy. Present processes, furnace reductions. Costly and give impure metals. Can only treat certain ores. Chlorine process treats pure sulphides, and gives still better results on mixed or refractory sulphides. Process is in three stages; writing Zn for zinc and M and N for other metals. (1) $ZnS + MS + NS + 3Cl_2 = ZnCl_2 + MCl_2 + NCl_3 + 3S$. (2) $ZnCl_2 + MCl_2 + NCl_2 + 2Zn = 3ZnCl_2 + M + N$. (3) $3ZnCl_2$ electrolysed $= 3Zn + 3Cl_2$. More detailed description. Working cost of process. Capital cost. Antimony. Arsenic. Bismuth. Cobalt. Copper. Gold. Iron. Manganese. Nickel. Silver. Tin. Zinc. Rule for capital.

PRESENT PROCESSES.

It will seem rather late in the history of metallurgy to bring forward a scheme which aims at nothing less than a complete revolution of the major part of the art of metallurgy, but this is a new society, and it is but fitting that a new process be brought before it for discussion and probably criticism, but I hope for and expect help in the way of suggestions and information from many of the members who are especially qualified to give it. At present we may take it the normal process for obtaining a metal is to convert it into oxide and reduce the oxide by carbon. Iron is a good example. It occurs as oxide, and is reduced by carbon or its monoxide. The result of this process is a metal which is very cheap, but very impure. The economical

* Paper read before the Faraday Society.

Digitized by Google

value of pure iron is unknown. It may be very high. More will be said about that presently.

Zinc is obtained purely by reduction, though work has been done on its extraction by electrolysis, especially from aqueous solutions. The bulk of the zinc of the world is obtained by a very crude method of reduction by carbon. Copper involves a furnace reduction process which may be partly classed as carbon reduction, and partly as a direct action analogous to the alternating reduction of lead sulphide. Tin is reduced by carbon. Electrolysis has come to the front, however, in the reduction of sodium and aluminium. The great drawback to the carbon reduction processes is that the metals so obtained are always impure, the refining often being exceedingly expensive; there is a great deal of waste, and many mixed, or so-called refractory ores, cannot be treated at all. Electrolysis provides an admirable means of getting many of the metals down, but the difficulty is generally in getting the metal from the ore to a suitable condition for electrolysis. Thus copper is very easily deposited from, say, copper sulphate solution, but it is by no means easy to prepare a copper sulphate solution economically from a copper ore. There is also difficulty as to the anodes. Carbon is corroded, and lead or antimonial lead needs a still higher E.M.F. Aqueous solutions of lead salts cannot be made economically from lead ores, and their electrolysis gives rise to lead sponge, which cannot be dealt with. Zinc gives similar troubles. What is wanted to displace furnace reduction of oxides and sulphides is to convert the ores into salts of the metals that can be easily and cheaply electrolysed, and to do this simply, efficiently, and economically.

The Chlorine Process.

The process I have the honour to bring before the society is simplicity itself. The sulphide ore is treated with chlorine so as to displace the sulphur and absorb all the chlorine. The chloride is then electrolysed to get the metal and recover the chlorine. This is the process in its naked simplicity. When all the details necessary, even in connection with complex ores, are considered, in comparison with existing methods, the process is exceedingly simple. As a good example, suppose pure galena is to be smelted. The galena is treated with hot chlorine so as to form lead chloride and sulphur. The sulphur is condensed as brimstone, and the lead chloride is electrolysed in the fused state, producing lead and chlorine. If there is silver or gold present, the fused chloride of lead is treated with metallic lead. This replaces any gold or silver there may be, and the precious metals alloy with the remaining lead, so that ultimately a bullion is produced as rich as may be desired, the only limit being its melting point, which must not be too high. The cost of desilverising by the ordinary processes is thus saved. This process thus recovers all the lead, all the silver and gold, and nearly all the sulphur. If the electrolyte vats were so tight that no air got in all the sulphur would be saved, but in practice a little sulphur is always burned into SO_2. Pure or nearly pure lead sulphide is easy to smelt in the ordinary way, but this smelting does not separate the silver, and is thus incomplete. In time, therefore, the chlorine process is likely to replace the present methods, even for pure ores. Take another example—pure zinc sulphide. The process is exactly analogous to that for pure galena. But in practice zinc blende contains gangue and generally iron, and these must be separated.

One of the great advantages of the chlorine process is that it is applicable to mixed ores, which are often absolutely refractory and useless otherwise. This process makes concentration quite unnecessary, unless merely for eliminating gangue, as the presence of several metals gives rise to no difficulty. In no case has one metal to be lost in order to extract another, and in no case is a metal brought out impure or needing refining. Take, for example, a mixture of sulphides of lead, zinc, and iron, with some silver. An immense amount of work has been done on this class of ore, and great progress has been made in concentrating, so that one part will leave enough zinc to be worked, and little enough lead not to interfere with the metallurgy, and the other part will leave enough lead and little enough zinc. Each portion is smelted for one metal only, the other being worse than wasted, as it is a nuisance. An intermediate ore, often a large proportion, is thrown away. The new process takes the ore just as it comes from the mine, without any previous treatment; or, better still, it takes the slimes, such as the Broken Hill slimes, which are at present accumulating as a monumental memorial to the barbarity of present smelting processes. The slimes contain zinc, lead, iron, silver, and gangue. Hot treatment with chlorine converts the whole of the metals into chlorides, producing a broth of mixed fused chlorides and gangue. The silver is extracted by substitution of lead, the lead is extracted by substitution of zinc, and the iron is thrown out as ferric oxide, not as metal, zinc oxide being used as substitute, and the gangue is got out by filtration. We have then nothing left but zinc chloride, and this is electrolysed to yield zinc and chlorine.

The process thus consists of three essential elements: treating the ores with chlorine; chemical treatment of the mixed chlorides by substitution, so that all the chlorine is combined with zinc; electrolysis of the zinc chloride to extract the zinc and recover the chlorine. One of the chief merits of the process is that it is so perfectly cyclical. The chlorine merely goes round and round. The works take in ore and electrical energy, and turns out metals, sulphur, and gangue. In treating sulphide ores with chlorine, as in analysis, or in the action of chlorine on sulphides generally, chloride of the metals and chloride of sulphur are produced. This is the reaction described in most text-books of chemistry. The formation of chloride of sulphur would be fatal to the process, however, as we should lose both the chlorine and the sulphur, and there is no convenient way of getting rid of large quantities of this offensive compound, far less of recovering the chlorine and sulphur. Decomposing with water is not a cyclic or a practical process. The discovery that sulphide ores can be decomposed on the large scale by chlorine so as to give off sulphur and not its chloride is, if we may say it with modesty, a possible turning point affecting a vast realm of metallurgy. The middle parts of the process, by which the mixed chlorides are converted into chloride of zinc by substitution and elimination of the other metals and of the gangue, involve ordinary chemical engineering only, though there is considerable room for ingenuity in inventing and working out the methods on a large scale. The electrolysis of zinc chloride is supposed to be very difficult or impossible. We have overcome any difficulties. Zinc is chosen as the final metal to be separated from the chlorine for two reasons: because is is chemically easy to substitute it for all the metals we want to extract, as it is very electropositive, and because it is easy to extract by electrolysis.

Smelting Lead-Zinc Bluestone.

The actual process, as applied to some particular ore, may now be described. The Broken Hill slimes may be taken as a good example. The crushed ore is run into a transformer. This looks like a small blast furnace made of fireclay with iron outside or of lined iron. It runs continuously, and we may start our description at a stage when a tapping has just taken place. The transformer then contains about 1cwt. of fused chlorides and gangue. The gangue almost floats in the chlorides. If much lead is present much of the gangue floats, so there is no caking or silting up. The top of the transformer has a cone like a little blast furnace. Ore is poured into the fused chlorides, and at the same time chlorine is blown in. The chlorine enters at the bottom by a sort of tuyere, which is a carbon tube. The cold part of this tube is connected to an iron pipe, which brings the chlorine. Dry, cold chlorine is easy to handle. It does not touch metals, and iron can be used freely. The chlorine bubbling through the fused bath displaces the sulphur, which comes off and is condensed. The action of chlorine on the sulphides in question evolves a great deal of heat, so that the transformer is self-heating, and there is no coal or coke firing or outside heating of any sort. The temperature is controlled by the rate of admission of chlorine. If the temperature is too low, chloride of sulphur may be formed. This may also be formed if there is a deficiency of ore supply. On the other hand, if the chlorine and ore are supplied too quickly, the transformer will get too hot, and some of the chlorides will distil over and be condensed with the sulphur. By running the transformer fast the temperature can be got so high that all the chlorides distil over, leaving only the gangue. The bulk of the transformer gives easy regulation. The temperature is the main consideration in determining the size of the transformer. It must be of such a size that when running at its normal rate the heat is conducted through the lining and radiated from the surface at such a rate that the contents keep at the right temperature. There is considerable margin allowable in temperature, and the temperature is under control by regulating the flow of chlorine and of ore. The temperature can always be lowered by running in a little extra ore or reducing the chlorine; but the chlorine feed depends on the electrolytic vats, and is practically constant. The larger the transformer the longer it will preserve its temperature with any fluctuations of chlorine supply, and the cheaper the pumping, labour, etc. It is therefore best to have large transformers. We have so far used a 10-ton, but a larger size with thinner lining will probably be better. The amount of gangue in the ore is important. As the gangue is about the same density as the chlorides, a large amount may be present without inconvenience as to fluidity. It is, of course, an advantage to be able to work on ores with little metallic content. It is quite easy to work with the metallic contents only half the ore, or even less. Poorer ores can be made workable by addition of those with more metal. The temperature depends on the metals in the ore too. Thus blende heats much more than copper sulphide; so that, other things being equal, a copper ore with little zinc should be run through faster, or mixed with, say, a zinc-lead ore.

To return to the working of the transformer, it is started with the remains of the last charge, and then chlorine and ore supplied till it is full. The regulation needs no skill. A hole can be opened at the top of the transformer, and as it is connected through the sulphur chamber to a chimney there is a

Digitized by Google

general suction. This draws air in at the hole, which burns the sulphur vapour. The blue flame shows there is enough ore. If too little is fed, fumes of ferric chloride fill the top of the transformer and pass into the sulphur. This is to be carefully avoided, and there should be excess of sulphides in the transformer until the end of the charge. At the end the ore feed is stopped, and the transformer run till brown fumes appear. These are by-passed round the sulphur chamber. The charge is then run out, and allowed to cool. At first great difficulty was expected in pumping the chlorine, as a pressure of some 10lb. to 15lb. on the inch is needed when the transformer is nearly full. The pumping presents no difficulty, and a chlorine pump will run night and day continuously without trouble. The well-known patented method with sulphuric acid flooded pumps would have been available, but such complications are quite unnecessary with dry chlorine. The dryness is of vital importance here.

We now come to the intermediate or chemical stage of the process. This varies with the ore used. We may take the Broken Bill slimes, and imagine there is copper too. This would be about as troublesome an ore as we could have. We have used the Broken Hill ore and mixed it with a Tasmanian copper ore, but we have chiefly worked on it alone. The fused mass from the transformer consists of chlorides of lead, zinc, iron, manganese, copper, silver, and gangue. It is run into water and through a filter press when cool enough. This takes out the gangue and lead chloride, carrying most of the silver. The gangue is easily separated from the lead and silver chlorides, and these chlorides are then dried and fused in contact with lead, which extracts the silver and any gold, and then with zinc, which gives lead, practically pure, and anhydrous neutral zinc chloride, which is ready for the electrolysis vats. The filtrate from the press contains a little lead and silver in solution, and copper, iron, manganese, and zinc. The lead and silver are taken out with spongy copper. The copper is taken out as sponge or "cement" by zinc, and we have left iron, manganese, and zinc chlorides. The iron is chlorinated up to the ferric state, and zinc oxide is added to cause precipitation. This throws down hydrated ferric oxide. This is the base of iron paint, and is marketable, its value depending on the colour obtained. The solution is further chlorinised in presence of more zinc oxide, and the manganese goes down as peroxide.

We have now substituted zinc for all the other metals in their chlorides, and have nothing left but zinc chloride. This is evaporated down carefully and fused. This decomposes some of the chloride, and makes an oxychloride. Steinhart evaporates *in vacuo* to produce neutral anhydrous zinc chloride. We have not done this; we find that with cautious boiling down there is not much oxygen in the final result. This is got rid of in open preliminary vats, which use inexpensive anodes, which are gradually used up. The consumption is less than if all the oxygen went off as monoxide. The anhydrous neutral chloride from these vats is then added to that from the lead chloride substitution, and is taken to the final electrolysis vats. The electrolysis vats are internally heated, as in the case of aluminium. The cathode is fused zinc, and the anode is carbon. Some makes of carbon do not stand well, but suitable carbons serve to stand permanently. Of course, chlorine has no action on the carbons. The vats are kept under a very light suction, so that if there are any leaks air goes in instead of chlorine coming out. The carbons are not hot enough to be burnt by this small admission of air. As the vats are kept warm by the excess of the electrical power over the chemical, the larger the cell the lower the E.M.F.; so that if the cell were large enough we could get down nearly to the E.M.F. corresponding to the heat of formation of zinc chloride at that temperature. So far 3,000 amperes has been the current used, but this means a very small vat. The output of fused salt vats is enormous in comparison with aqueous work. A 10,000 vat is now being tried. Above that size the current will be inconvenient. With the small vats four volts per cell is needed; with 10,000 amperes three should do. It is best to count on four; this allowance ought to cover the power for the preliminary electrolysis, too. The current efficiency is practically unity. Zinc smoke is, of course, formed if the temperature is too high. The vats are very simple—merely iron cases lined with firebrick. The chloride soaks into the porous brick and solidifies somewhere, so it is really a vat with zinc chloride walls.

Cost of Process.

As to costs of the process, the first thing to realise is that it smelts for all the metallic contents of the ore, not for only one; that all the metals are completely extracted. There is no waste by fumes or imperfect extraction, and there is no slag. The gangue looks like river sand. There is no room for loss. All that comes into the works is ore and electrical energy; all that goes out is pig metal, sulphur, gangue, and oxides. The chlorine goes round and round. There is no room for appreciable waste of chlorine either. A leak that would show in the balance-sheet would make the works uninhabitable. There is, however, a trace of chlorine in the iron oxide, as it is apt to contain a little oxychloride. There is also a loss in collecting the hydrochloric acid from the boiling down of the zinc chloride. A little chlorine must therefore be added to the stock. This can be done by buying crude zinc chloride, or galvanising pickle, or precipitating calcium chloride with zinc sulphate. In out-of-the-way places it is much simplest to buy zinc chloride, as it is more portable than hydrochloric acid.

It may be said that a process for such a problem must be a maze of chemical operations, and when you come to the end you have to begin again. This is not the case here at all. The process has only three simple stages: (1) transforming sulphides into metallic chlorides and sulphur; (2) substituting zinc for all the other metals in the metallic chlorides; (3) electrolysing out the zinc and recovering the chlorine. Compare this with ordinary metallurgy. To describe the metallurgy of a single metal at all adequately requires a book. Try and explain even most superficially the metallurgy and refining of argentiferous lead, zinc, and copper to anyone quite new to the subject in the few pages here devoted to description, and it will be seen how simple the new process is. Add to the description of the metallurgy of these metals an account of the refining of copper and zinc and refining and desilverisation of lead, and even then you have only half done. To make the comparisons on all fours you must give an account of the concentration and separation of refractory ores, and give a description of methods for dealing with a mixed ore of lead, zinc, silver, iron, and copper. There can be no doubt that though the steps in the new process sound unfamiliar to ordinarily trained metallurgists, it is in comparison ludicrously simple. But there is even more than this. The new process treats ores whose smelting by ordinary processes cannot be described, even with unlimited complications, because they are at present untreatable.

As to costs, everything depends on what ore is used and where it is used. The most obvious course is to work on refractory ores which are otherwise valueless, but leave large metal contents. The cost of the ore delivered at the works is then known. Thus, even in England bluestone ore can be bought and delivered at from £2. 10s. to £3 a ton, ready for running into the transformer. The metal content is £8. 16s., taking zinc at £20, lead at £12, and silver at 2s. If higher prices can be maintained for pure metals, of course the content must be taken at a higher value. This figure includes all valuable contents. The cost of the intermediate process is difficult to state, as it is a question of locality and labour. The capital in this part of the process is small, but in the estimates heavy allowance has been made for deterioration, and all other contingencies. On the other hand, the conversion, which alone is a new sort of chemical experience, is extremely simple and easy. The intermediate processes depend on the ore. Thus, if there there is no copper, part is cut out altogether. If there is no iron, by which I mean not even enough to hurt the zinc, the transformer product would not be dealt with in the wet way at all. The wet way is to get rid of iron and manganese, and to get out copper. Lead and silver can be got out by substitution in the fused state with great ease, but copper has too high a melting point, and is therefore taken out by the wet process.

To make a very safe shot, the cost of all the process except the energy for electrolysis may be taken at a rough figure of 30s. per ton of ore. This will easily cover all depreciation, a small percentage on capital, all labour, and management. As the process uses ores with about half the contents metallic, though it can work with half sulphides, this means about 30s. per ton of chloride of zinc handled. Most of this work is pure circulation, agitation, and filtration, all cheap processes. The solution is not bulky, as it is used as strong as the filter press cloths will stand. Evaporating down and preliminary electrolysis are the most expensive parts of the process, and they are not serious. The loss of chlorine, which has not yet been determined, may be taken as costing about 1s. a ton of ore for every 1 per cent. of chlorine wasted, if it is made up by buying chloride of zinc. If it is made up by hydrochloric acid or calcium chloride, which is far cheaper where there is no carriage difficulty, the cost is about half that of zinc chloride. This loss of chlorine is included in the 30s. a ton of ore, and in the estimates to follow, as power is taken at prices in England, where it is not cheap, we may assume we can get calcium chloride cheap. This does not complicate the estimate by showing a zinc output a little higher than the intake in the ore.

The cost of energy is very easily determined. If it is generated by steam-engines of high grade in this country in a convenient district it may be taken as 0·25 per kilowatt-hour, including depreciation, coal, oil, repairs, labour, and management, and a small interest on capital. This is a close estimate, but one which can be realised on large plants running day and night on uniform full loads. The cost by producer gas and gas-engines is somewhat uncertain. It may be taken at 0·125, though that is probably a very tight figure. Water power in a favourable situation may be taken at 0·085. This refers to water powers such as on the way down from the American lakes to the sea. It is for a works planted close to the generators, and does not cover rotary transformers or step-down plant.

UNIVERSITY C

NOTES.

Poldhu Station.—Last Saturday Mr. Marconi was honoured by a visit from the Prince and Princess of Wales to the wireless telegraphy station at Poldhu. The Royal guests were interested with what they saw.

Tantalum.—The electrical furnace is greatly enlarging our range of metallurgical knowledge—thus tantalum was hitherto known as a more or less pure powder, with a density of about 10·50. By heating 10 minutes in a very powerful electric arc, M. Henri Moissan has succeeded in reducing tantalic acid with powdered carbon, and has obtained the metal in a fused state. It has a brilliant metallic appearance, and a density of 12·79. It is very hard, easily scratching glass and quartz, has a crystalline fracture, and is infusible in the oxyhydrogen blowpipe. Certain reactions class it with the metalloids rather than with the metals proper.

Motorcar Dangers.—In view of the crusade which has been organised in certain of the daily papers against motorcars, it is interesting to read a letter from Mr. W. Rees Jeffreys, the administrative secretary of the Automobile Club. He comments on the fact that during the automobile fortnight in Ireland over 1,000 cars were used on the roads of that country, and that speed limitations were disregarded by tacit arrangements with the police, who confined themselves to regulating the traffic in towns and villages. In spite of the legal speed limits being frequently exceeded, not a single accident by which any person has been seriously injured has been recorded.

Great Gooseberries.—The gooseberry season for the daily Press is fast approaching, and we were recently asked to believe one of French origin. It was stated, under the head of "Electricity in War," that a well-known scientist, Dr. Le Bon, in the course of experimenting with a powerful electric coil was suddenly enveloped in flames. These flames he therefore predicts will be of service in burning up collections of shells, gunpowder, cartridges, and battleships. The only criticism that we think it worth while to make is that the flames which completely enveloped Dr. Le Bon do not seem to have injured him, and we are not aware that a battleship is so much more combustible than a professor.

Electric Signalling.—The Great Western Railway have adopted the Miller signalling system for the Severn Tunnel, which is 4 miles and 600 yards in length. With the new signalling system the tunnel will be divided into sections of 1,200 yards length, thus permitting more than one train on the same line in the tunnel at the same time and with perfect safety. The usual semaphore signals at the sides of the line will be supplemented by "repeat" signals indicated in the cab of each locomotive before the eyes of the driver. This system, which can only be used in connection with electrical track circuit signalling, is in successful operation in the Park-avenue Tunnel of the New York Central Railway. We published a full description of this system when it was being tried on the Great Central Railway at Woodhead.

Continental Electric Railway.—The first electric railway in the Austrian Empire has been opened between Tabor and Bechin, in Bohemia It is 15 miles long, and, according to a Vienna correspondent, the maximum speed attained is only 19 miles an hour. That passenger traffic is strictly limited in this district of Bohemia may be essayed from the statement that a train consists of only two cars, with a carrying capacity for 40 passengers and 36 tons of goods. The new railway has a special interest from the fact that we believe it to be the first line to be entirely regulated by the telephone. The correspondent in question states that there are no signals, the telephone being used by the driver in all cases to ascertain whether the line is clear. Each car is fitted with a portable instrument, which may also be used by the passengers.

St. Marylebone Electric Lighting.—The special meeting, held last week, of the St. Marylebone Borough Council did not disclose on discussion much unanimity on the vexed question under discussion. A number of members advocated that the Council should go on their knees to the Metropolitan Electric Supply Company and ask for the best terms on which they can be allowed to repent of their absurd desire to purchase the St. Marylebone portion of that company's undertaking. Alderman Sir Thomas Brooke Hitching, who in years past was the strongest advocate for purchasing this undertaking, now advises that a 3d. rate would be preferable to completing the purchase. The general conclusion, however, of the meeting was that the matter must be carried through, and that the money would have to be obtained. We are afraid that the St. Marylebone Council have not shown reasonable business capacities over the electric lighting question, and that the ratepayers will long have reminders at intervals that this has been so.

Electrical Work in India.—Our contemporary *Indian Engineering* for June 27 congratulates in a leading article Lord Curzon's Government on the enthusiastic encouragement it has extended to electrical developments. The language of the article is almost beyond us at times; for instance we read that "the company promoter is an unavoidable excrescence of present-day commercialism, and the opportunity to exploit the unwary, which the electrical activity of municipal India affords, is much too good to be neglected. It behoves the authorities therefore to exercise a wise discrimination in placing contracts." The rest of the leader is devoted to a strong recommendation of a trust formed by Messrs. Marshall, Sons, and Co. and Messrs. Crompton and Co. for the laying out of electric stations in India and for financing the same. The particulars given of this combination will cause much blushing in Salisbury House. From the same issue of our contemporary we gather that schemes are on foot for the electric lighting of the towns of Hyderabad and Chudderghaut.

Overhead Wires.—On Monday last Mr. Markham, M.P., in the House of Commons asked the President of the Board of Trade whether, seeing that the Governments of America, France, Germany, Switzerland, Italy, and other countries have, during the last 10 years, passed laws regulating the methods of distributing high-tension current by overhead wires, which has resulted in a widely employed use of electricity for industrial purposes, he would say whether there was a single case in Great Britain or Ireland where high-tension current overhead wires had been installed. Mr. Gerald Balfour, in reply, said there was no case in the United Kingdom or Ireland where bare overhead wires have been used for the transmission of electricity at high voltages for industrial purposes. The Department had not been asked to sanction this method of supply until quite recently, and was quite ready to give favourable consideration to each application. The matter had his personal attention, and he begged to inform the hon. member that the Board of Trade had been, and still are, prepared to consider each case on its merits without reference to any model regulations. In the cases now under consideration the electrical adviser will prepare special regulations applicable to the circumstances of each case. It remains to be seen how far the Board of Trade, after examination of special cases, will allow of complete

Digitized by Google

equipment for the proposed additional technological teaching and research are provided to a value of not less than £500,000, the Council will be well advised to contribute, out of the moneys annually placed at its disposal under the Local Taxation (Customs and Excise) Act of 1890, a sum not exceeding £20,000 per annum towards such part of the work as falls within the statutory definition of technical education, subject to the following conditions: (*a*) that a scheme be prepared to the satisfaction of the Council for the constitution of the governing body, and the adequate representation of the Council thereon; (*b*) that financial arrangements, adequate to the whole maintenance of the proposed work, are made to the satisfaction of the Council; (*c*) that, in view of the national scope and utility of the proposed work, substantial contributions towards maintenance be made from funds of a national character; (*d*) that due provision be made in the scheme to prevent overlapping and secure co-ordination of the work already carried on by the University College, polytechnics, and other science and technological institutions, and the proper connection of the whole with the university; (*e*) that a sufficient number of scholarships, including free places, be placed at the disposal of the Council; (*f*) that it be considered whether other counties and boroughs should not be invited to contribute towards the maintenance, receiving in return the right to send their picked scholars for instruction under the proposed scheme."

Rubber Cultivation.—In the past six or seven years rubber cultivation has been taken up in the Malay Peninsula with considerable zest. The credit for this is not due so much to the progressive spirit of the planter out there as to the force of circumstances which compelled him to look about for other cultivations than the coffee tree when the decline in price of that article of commerce followed the high prices ruling for coffee in 1896. Since that year the cultivation of the rubber tree has received great attention, and an authoritative estimate states that at the present time in the Malay Peninsula there are at least 12,000 acres planted with Hevea Brasiliensis, the tree furnishing the Para rubber of commerce. This acreage represents about 1½ millions of trees, presumably the whole being the progeny of the trees originally introduced by the Government of India in the seventies. Some figures have been published by Mr. Stanley Arden, the superintendent of the experimental plantations in the Malay States, showing the cost of opening and maintaining a plantation until it is productive. These are very encouraging to the planter, although he must not look for profits until about the sixth year, which may be taken to be the first productive year. Assuming a plantation of 500 acres, Mr. Arden estimates the total expenditure for the first five years at nearly £6,000, or an average of about £12 per acre, to which must be added the interest on all money expended. The yield per acre in the sixth year would amount to 25lb. of rubber, and, taking an average selling basis of 2s., the commercial value would be £2. 10s. The average cost per acre per annum for upkeep being £1. 16s, it appears probable that, after deducting all expenses in connection with the preparation and marketing of the rubber, the return during the sixth year would leave a small margin of profit. By the time the trees are six years old, 75 per cent. should give an average yield of 12oz., which is equal to 56·25lb. per acre. Valued at 2s per pound, this gives a gross return of £5. 12s. 6d. per acre, so that, after deducting the cost of harvesting and marketing, there is every prospect of a fair return on the capital expended during the seventh year. By this time the cost of upkeep should have reached a very low figure, while the yield should increase year by year, and should average at least 150lb. of rubber per acre by the time the trees are nine years old, and the following year probably 200lb.

Submarine Electric Power Cables.—A paper on the above subject, recently presented by Mr. G. U. G. Holman, of Quebec, to the Canadian Electrical Association, is interesting reading, as showing the difficulties which have been met with in carrying power cables 3,400ft. across the bed of the St. Lawrence River at Quebec. The cable, which supplies 1,000 h.p. to the Quebec Railway, Light, and Power Company, is used for two-phase currents, and was laid in December, 1901. This cable is composed of four 19-strand conductors, each of an equivalent of 2-0 solid copper. Each conductor is covered with a 40 per cent. Para rubber compound to the thickness of ⅛in., and then wrapped with one layer of 3in. black insulated tape. The four conductors are twisted one revolution in 4ft. about a common jute centre with four No. 14 B. & S. gauge solid copper rubber-covered wires as pressure wires, laid in between the four heavy conductors on the periphery of the cable. The whole was then covered with heavy rubber-filled tape, and served with two layers of tarred jute. An armour of 30 No. 6 B.W.G. galvanised steel wires were spirally laid over the cable. The weak point was early shown to be the pressure wires. One of the wires open-circuited in June, 1902, six months after the cable was put in service. In August, 1902, a second one open-circuited, and in October of the same year a breakdown in the cable occurred, which showed itself on one of the pairs of conductors." It will be remembered that in England "pressure wires," or, as we call them, "pilot wires," have been the cause of the breaking down of a good many electric lighting cables, and that the practice of laying up pilot wires in multiple-core cables has been largely discontinued in consequence. In a new cable Mr. Holman is laying across the St. Lawrence these pilot wires are being omitted. The new cable will also be twice as heavily armoured. In the latter part of his paper the author comments on the smoothing out of the voltage variations produced by these cables. He says that, due to condenser action, the output end of the cable presents a smoother record curve than the input end. The evidence of this we should like to see, as attempts to get oscillographs of this phenomenon in this country have not been very successful. In laying such cables in rivers where ice difficulties in spring are as serious as on the St. Lawrence, care should be taken to keep the line of the cable at the shore ends as nearly as possible along the line of ice flow.

High-Tension Training.—At the recent meeting of the Canadian Electrical Association, a paper was contributed by Mr. Paul Lincoln on "The Training of the High-Tension Engineer." In this comparison was made between college training and practical experience. We think that our readers will all agree with the author, and will be pleased to read the following extracts from his accumulated wisdom. He says, for instance, that the graduate of a college "has learned how to make accurate measurements of power, but finds after he has been up against it that it is easier to measure power than it is to persuade the customer that his power is being accurately measured." Also, "the newly made graduate usually has a high opinion of efficiency and can calculate the economy of a transmission to an excessively small fraction. When he becomes responsible for the operation of a transmission line, however, it does not take him long to find out that efficiency is a vanishing quantity when compared to continuity of operation, and that economy is not to be considered as being in the same class as good service. The

Digitized by Google

technical graduate, in short, may have knowledge a-plenty, but his wisdom is to come" The author rightly points out, however, that the great advantage of the technical education is that it gives the man proper equipment for overcoming the difficulties with which his experience is bound to bring him into contact. It gives him, as nothing else will, the power of initiative—that most valuable quality that a high-tension engineer can possess. There is nothing like the college education to equip a man for making every accident a lesson in how not to do it, and every failure a stepping stone to success. Take, for instance, the recent accident to the Niagara plant, in which a fire destroyed the cables on the bridge connecting the power-house with the transformer-house. The lesson to be drawn from this accident—so plain that he who runs may read—is that where many cables are run together, extreme precaution should be taken to protect against danger of fire. Before the occurrence of this fire there was little suspicion that the insulation of cables when lead-covered or protected by fireproof braid—as was the case at Niagara—is sufficient to maintain so fierce a blaze without the aid of some other combustible beside the insulation. One accident of this kind should suffice not only for the Niagara Falls people, but also for any others who have occasion to run many cables together. It takes a considerable time for the accumulated knowledge of practice to get introduced into technical courses at colleges, and hence we are strongly in favour of special courses of lectures being given at these colleges by practical experts. The author rightly concludes that students should not be afraid of making failures, as, as Mr. Roosevelt rightly says, "absence of failure accompanies only lack of effort."

Sodium Alloys in Cathodic Polarisation.—In this paper, which is abstracted in the current number of the *Journal* of the Chemical Society, the author discusses the production of hydrogen in the electrolysis of alkali solutions and concludes that it is formed both primarily and secondarily. Lead and tin cathodes were polarised in a 3N-solution of sodium hydroxide and their potentials measured against a mercury electrode. It was found that the steady evolution of hydrogen from these cathodes is connected with a loosening of the material of the cathode, and this is attributed to the formation of alloys with the sodium. These alloys are then decomposed by the water. When lead and tin are intensely polarised in this solution, a metallic cloud is formed. It has been proved that alloys of these metals rich in silver are decomposed by water with production of this cloud. With lead, the loosening of the metal and steady evolution of hydrogen take place when the cathode potential is about 0·7 volt, and with tin at 0·4 volt, referred to the potential of hydrogen in the same sodium hydroxide solution as zero. The cloud effect in the case of lead is produced at the potential 1·3 volts, and of tin at 1·4 volts, referred to the same standard. Zinc and platinum give rise to no cloud effect, but the metals become loose and porous on the surface. With platinum and lead, the metal is changed to a much greater extent in acid solutions than in solutions of alkalis. As this change of the metal is due to the action of the cathion, it appears that hydrogen permeates the metal more easily than sodium, and at the same time it definitely proves the secondary character of the hydrogen evolution at the cathode in the electrolysis of alkali hydroxide solutions. The potential of sodium alloys with lead, tin, and mercury was measured in a methyl alcohol solution of lithium chloride at −80deg. The results indicate that the alloy becomes covered with a layer of the pure metal (lead or tin). When the potentials are plotted against the atomic concentrations of sodium in the alloys, the changes in the direction of the curve indicate the existence of the compounds Pb_2Na and Sn_3Na. In the same way, the existence of definite compounds of mercury and sodium are indicated. The results taken together show that these definite compounds are formed during the electrolysis of alkali solutions and are then chemically decomposed by the water present. Based on the rule that when solids are diluted with solids to produce solid substances the heat change is equal to the free energy, the author has calculated what the potentials of the sodium alloys should be from the heat change and the potential of sodium in the methyl alcohol solution of lithium chloride, and finds values in good agreement with those observed.

Durability of Manganin Resistances.—Some time ago a number of German electrical and engineering concerns, the Imperial Standardising Commission of Vienna, and the Physical State Laboratory of Hamburg—10 bodies altogether—resubmitted, on the invitation of the Reichsanstalt, manganin resistances which had been in use for periods varying between two and four years. There were 31 resistances—manufactured by O. Wolff, of Berlin (25); Hartmann and Braun, of Frankfurt (3); and Siemens and Halske, of Berlin (3). They had been tested at temperatures of about 20deg. C, and the new results were reduced to the original temperatures. The temperature coefficient of manganin is small; in these cases they were mostly positive. The maximum value recorded was $+42\times10^{-6}$; the average would be below 10 ($\times10^{-6}$) however. The redeterminations of these temperature coefficients showed hardly any change. Eleven of the resistances were of 0·001 ohm, 12 of 0·001 ohm, and 8 of 0·0001 ohm. The determinations were made by comparison with standard resistances of these magnitudes. Some of the 0·01 ohm resistances had had to stand currents of 50 and 75 amperes; some of the 0·001 ohm resistances, currents of 700 amperes for two hours; some of the smallest resistances, currents of 2,000 and 3,000 amperes; a few had served for occasional control only. Most of the manganin foils had been kept in petroleum while under current. It results that 25 of the 31 resistances had changed by less than 0·05 per cent.—that is to say, had practically remained constant, since the changes lay within the limits of the reliability of direct reading instruments. Of the 10 resistances which had changed by more than 0·02 per cent., seven were box models of large size, which had had to bear hard usage, being under current every day for three hours at the time. Only two resistances were judged to have failed to pass, having changed by more than 0·1 per cent. One 0·01 ohm resistance had decreased by 0·12 per cent. in $4\frac{1}{3}$ years. The reasons are not clear; the manganin had turned brown, but did not otherwise appear to be affected. The other case was that of a 0·001 ohm resistance which had increased by 0·23 per cent. within $2\frac{1}{2}$ years. In this instance the petroleum had attacked the manganin, which was coated with a brown mud and crust. This latter resistance had been used pretty badly, the former not. On the whole, however, the behaviour of the manganin had been excellent, and the experiments bring out another satisfactory feature. The gauging of the resistances by the manufacturers had proved correct within 0·05 per cent. in all but two cases. Twenty-one, in fact, were correctly estimated within less than 0·01 per cent., and Dr. Lindeck, in his report on the matter, adds that the firm of O. Wolff supplied a resistance of 0·00002 ohm, which was found correct within 0·01 per cent. It is, therefore, quite permissible to gauge very small resistances by comparison against one-ohm standards.

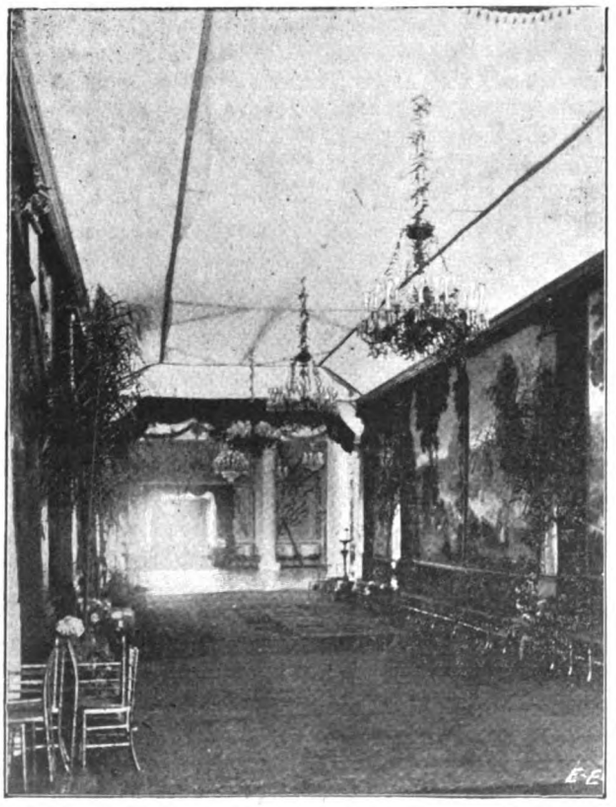
TEMPORARY INSTALLATION AT MARLBOROUGH HOUSE.

Although it took weeks to build instead of a night, the contractors (Messrs. Simmonds Bros., Limited, of Newton-street, High Holborn) have considerably taken the shine off Aladdin's lamp by raising on the lawn of Marlborough House a temporary palace—consisting of ballroom, smoking-room, supper-rooms, galleries, etc.—a temporary erection which for size and brilliancy has never been equalled in this country. The whole structure covered 17,555 square feet, and about 1,700 electric lamps were used to illuminate it. A carriageway was outlined to it by 18 16-c.p. lamps, and 2,000 bucket lamps were distributed in the grounds. The main hall or ballroom proper was 130ft. long and 60ft. wide, divided into a centre hall and two side aisles by 18 Gothic columns, which glittered like white marble The ceiling rose to 30ft. from cornices 21ft. above the ground.

Ball Room.



Main Corridor.

Supper Room.

These cornices or entablatures were outlined with 340 5-c.p. lamps. The centre bore five electroliers of pure

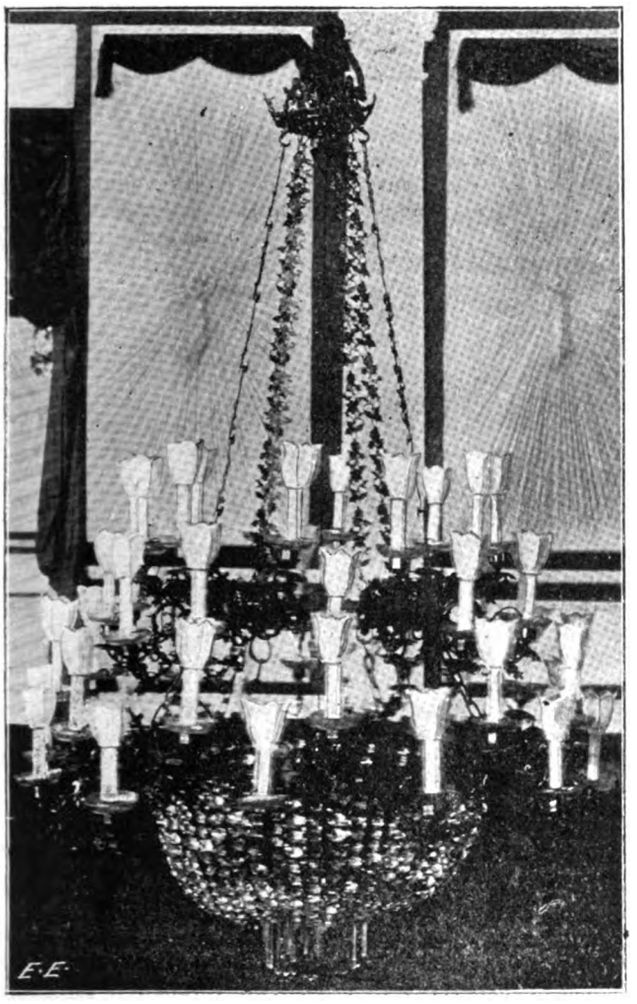
crystal, each fitted with 60 electric candles with white silk shades, prettily draped with pink geraniums and smilax. In addition, there were 16 similar six-light fittings suspended from the ceiling, and 15 six-light electroliers of Louis XV. style in the aisles, making a total of 602 lamps for the room. Eight 12in. fan motors were fitted in special cup-



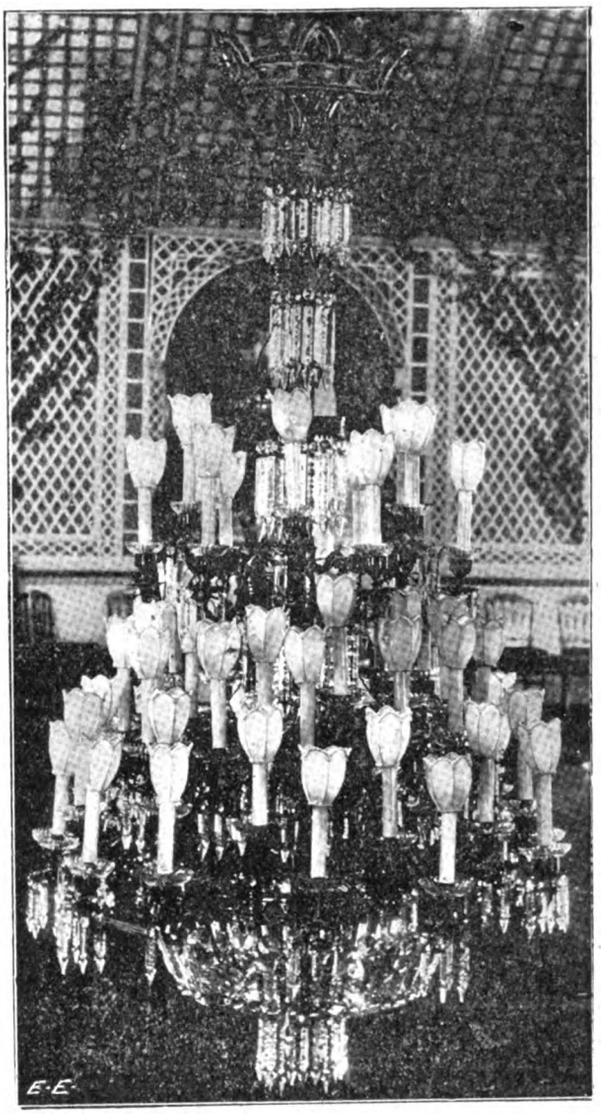
48-Light Electrolier from Supper Room.

boards in the walls. The floor was a beautiful teak and oak parquetting laid down in yard squares. Handsome

6-Light Electrolier from various parts.

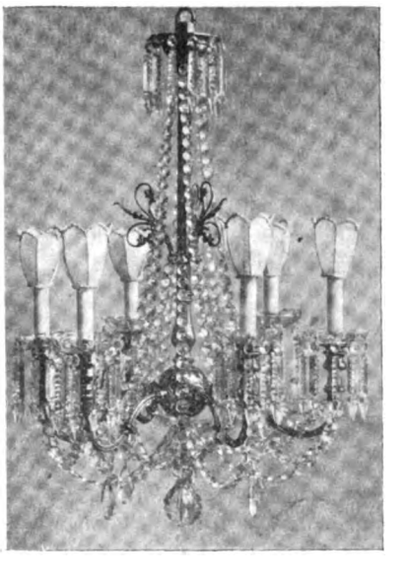
carpets, green and white silk curtains, and a profusion of flowers completed the truly magnificent arrangement. The bandstand was almost hidden amongst flowers,

like a balcony in Piccadilly in the height of the season. On one side of the room French casements led on to the



60-Light Electrolier from Ball Room.

lawn, squares of trelliswork upon which ivy was trailed in a most natural manner filling the interstices between them. On the opposite side large pier glasses, similarly draped, made the counterpart.



6-Light Electrolier from Ball Room.

The supper and buffet rooms were similarly lighted and decorated—the larger in cream and yellow, the smaller in green and white. The smoking-room affected

Digitized by Google

Oriental splendour. The entablature in the supper-room was also outlined with 280 5-c.p. lamps, and four 48-light and 10 6-light electroliers of remarkably handsome designs were suspended from the ceiling. There were ample corridors connecting the various apartments, and others leading to Marlborough House itself; the larger gallery, with its oak pilasters and almost priceless Gobelins, lined with satin-covered gilt settees and chairs, draped and filled with flowers and palms, making an ideal sitting-out place.

The electric current was obtained from the St. James's and Pall Mall Electric Company's system by a special main from the street at 214 volts pressure, everything in the installation being controlled by a 300-ampere switch on the same. Three $^{19}/_{14}$ cables were laid all through the house, running to a central part in the marquee. In the switchroom there was an 80-circuit switch and fuse board, made by Messrs. Simmonds Bros. There was also a sub-main double-pole switch and fuse board of four circuits, the whole being controlled by a second main switch on the same board. Throughout the installation every wire was kept apart, thus making the job as safe as if it were meant to be permanent. The cables used were Glover's (600 megohms). The switchroom was well ventilated with fans. There was a two-pole fuse and a one-pole switch to every 20 circuits, connected with a two-pole main fuse and one-pole main switch on the same board.

The whole installation was sub-divided into three-ampere circuits, with a switch and double-pole fuse to each circuit. The total of 1,700 lamps included five electroliers of 60 lights, four of 48, four of 24, one of 12, 48 of 6, and two of 8 lights, and 14 three-light brackets, besides the 620 cornice lights, etc., already mentioned. All these fittings were wired with a special plug adapted recently patented by Mr. H. Stokes, A.M.I.E.E., the electrical engineer of Messrs. Simmonds Bros., who was in charge of the work, having Mr. White as foreman. The bandstand in the ballroom was connected with electric bells with that in the supper-room. There were in all 16 ventilating fans to cool the atmosphere of these tent buildings.

THE PRODUCTION OF PULSATING CURRENTS BY MEANS OF A MICROPHONE.*

That a pulsating current can be set up by bringing a telephone receiver and a microphone, connected up in the usual manner, into close proximity has long been known. The current becomes noticeable by a more or less loud humming of the telephone. No actual practical use has yet been discovered for this phenomenon, though many suggestions have been made.†

The necessary connections for obtaining a continuous note are shown in Fig. 1, where M is a Berliner microphone, S a small sheet of iron about ·1mm. thick, E an electromagnet with 300 turns, A a battery of accumulators, and T a key. It will be seen that every change of the microphone membrane, which produces a corresponding change in the resistance of the microphone, also produces changes in the magnetic field acting on the membrane. If, for instance, the current increases due to any cause, there will be a downward motion of the membrane and an increase in the microphone resistance. If the circuit considered were a non-inductive one, this increase in resistance would produce a simultaneous fall in current, and the membrane would, in consequence of the reduced magnetic pull, soon come to rest. Since, however, this case never occurs in practice, as the self-induction of the circuit always produces a time lag between the phase of the membrane motion and the corresponding current phase, a continuous vibration of the membrane occurs. The frequency of this vibration is such that the time lag between the two phases becomes equal to a quarter of the wave-length of the resulting pulsating current.

Since this necessary condition of continuous vibration is fulfilled, and yet the phase difference between volts and amperes can never quite equal 90deg., in consequence of the ohmic resistance of the circuit, the action must be aided by the mass of the membrane and other circumstances.

Experiments have, moreover, shown that the phase difference between current and voltage is nearly 90deg, so that Helmholtz's formula is applicable for the approximate determination of the frequency. In accordance with this formula, the time of swing is

$$t = \frac{4\,L}{W} \log_\epsilon \frac{J'}{J},$$

where L = the coefficient of self-induction;
W = the resistance;
J' = the current amplitude corresponding to the maximum change in resistance;
J = the difference between J' and the real current amplitude.

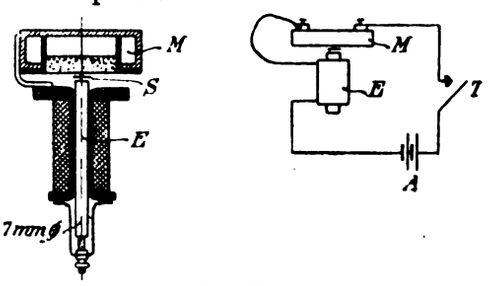


FIG. 1.

It will be seen that the time of swing is a simple function of the self-induction of the circuit. It follows, therefore, that the frequency of the note set up with the above described arrangement of apparatus will also be a function of the self-induction, although the connection is much more complicated in this case, owing to other interfering actions.

Experiments carried out with apparatus such as that shown in Fig. 1 indicated that the range within which the frequency could easily be varied was about 300 to 1,000 vibrations per second.

The experimental arrangement allowed a series of different self-induction coils, l_1 l_2 . . . (Fig. 2), to be inserted into the microphone circuit by means of the key-board, t_1 t_2 . . .

The notes thus produced were readily heard in a telephone, T, connected to the circuit through a secondary winding, and they could easily be made audible in a large hall by means of a so-called loud-speaking telephone.

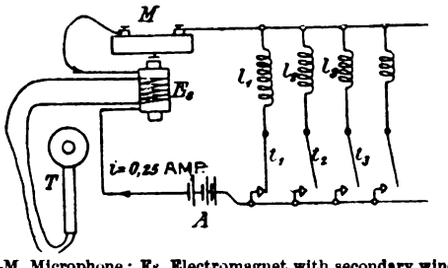

FIG. 2.—M, Microphone; Es, Electromagnet with secondary winding; T, Telephone; A, Accumulators; l_1 l_2, Self-Induction Coils; t_1 t_2, Keys.

The coils employed were equal in size, the length of winding space being 26mm., the inside diameter of the coil 15mm., the number of turns 500, and the approximate resistance 3·4 ohms. The value of the self-induction of the different coils was determined by the section of the iron cores (iron wires). When notes whose vibrations exceeded 600 per second were required, it was necessary, so as not to weaken the field acting on the membrane, to reduce the original self-induction. This was accomplished by connecting a capacity (small Leyden jar) in the secondary circuit.

It seemed impossible to obtain vibrations lower than 300 per second because of the large self-induction and, consequently, great throttling action on the current amplitude.

The simple manner of varying the frequency and the sinusoidal character of the current waves are great advantages in favour of this arrangement as compared with

* Translation of an article by E. von Lichen and E. Reisz in the *Elektrotechnische Zeitschrift* for June 25, 1903.

tuning-fork and stretched-string interrupters. On this account the method may find advantageous use in Mercadier's multiplex telegraphy. In a slightly modified form it might also be employed for measuring purposes, such as the comparison and measurement of self-induction coefficients, etc.

MUNICIPAL ELECTRICAL ASSOCIATION.

The meeting on Thursday, July 16, was held in Newcastle-on-Tyne. The members were welcomed by the Mayor, who in his speech referred in most complimentary terms to the municipal tramways and to the tramway manager, Mr. A. E. Le Rossignol. Speaking as the manager of the Newcastle and Gateshead Gas Company, he had no objection to municipal competition all the time the Bermondsey clause was adhered to and the rates were not called upon to make up the deficits.

Mr. Gerald Stoney, as chairman of the Local Section of the Institution of Electrical Engineers, also welcomed the members.

Alderman G. Pearson's paper was then read on

The Sphere of Utility of a Power Company.

BY ALDERMAN G. PEARSON, HON. SOLICITOR, CHAIRMAN OF THE BRISTOL ELECTRICAL COMMITTEE.

In the face of the fact that power companies are with us, and are apparently come to stay, it is, the author thinks, the duty of an association such as this to carefully consider the extent to which they may be utilised in the interests of the municipalities and other local governing bodies of this country whose electrical interests are generally in the hands of gentlemen who are members of this association. Those who see in power companies the panacea for all the trading ills to which the municipal and manufacturing flesh is heir are, the author thinks, wrong, and are only a little more wrong than those who see nothing worthy of support in power companies, and look upon them all as the natural enemies of all municipalities. The truth in this, as in so many other questions, lies in the mean. Power companies may be useful to some municipalities, whilst in the case of others their services are not required.

Within the recollection of most of us, companies were formed for the purpose of exploiting every suitable and unsuitable area for electric lighting purposes, and most of the companies came to an untimely end, and all the shareholders obtained for their money was the honour of holding the shares and paying the calls upon them, and they were seldom worried by considering the particular rate of dividend with which they would remain satisfied. We see the same feverish state of pushing in the case of power companies at the present time, and we may reasonably ask whether the result will or will not be the same. The whole of the large towns are now occupied either by municipally-owned works or works owned by companies, by far the larger proportion being owned by municipalities. The promoters of the earlier Power Bill did not err on the side of modesty. They certainly asked for all even they could reasonably or unreasonably ask from Parliament, with the result that their Bills were opposed and thrown out by parliamentary committees. Later Bills were more astutely drawn, and some show of respect for the rights of persons in possession was evinced; but still the claim to enter large towns already covered by a municipally-owned undertaking was insisted upon, but the result has been that all large towns have as yet been excluded from the operation of the power companies, as will be seen from the accompanying list, which gives the title of the Act and the towns excluded therefrom:

County of Durham, 1900.—South Shields and Sunderland. Also Felling and Hebburn, except for passage through district.

Lancashire, 1900.—Manchester, Stockport, Liverpool, Bootle, Salford. Part of Bolton excluded for all purposes, and no right of passage through district.

North Metropolitan, 1902.—Willesden.

South Wales, 1900.—Cardiff, Newport, Swansea, Neath, Barry, Rhondda, Briton Ferry (excluded for four years), Abercarn, Abertillery, Ebbw Vale, Margam, Mountain Ash, Tredegar.

Clyde Valley, 1901.—Paisley and Hamilton, except for passage through district; Glasgow for all purposes; Partick (Beauchief and Norton parish excluded); Kinning Park, Govan, and extensions of Govan, Port Glasgow.

Derbyshire and Nottinghamshire, 1901.—Nottingham, except as to right to pass through; Derby, as at passing of the Act, and also as to contemplated extensions.

Yorkshire, 1901.—Bradford, Leeds, Sheffield, Barnsley, Batley, Brighouse, Dewsbury, Doncaster, Keighley, Morley, Ossett, Pontefract, Pudsey, Rotherham, Todmorden, Wakefield, Shipley, Huddersfield, Halifax.

Gloucestershire, 1902.—Cheltenham and Gloucester.

Leicestershire and Warwickshire, 1902.—Leicester, Coventry, Sutton Coldfield, Aston Manor, Rugby, Royal Leamington Spa; Loughborough (including Nanpantan, Thorpeacre-cum-Dishley, Hathorn, and Woodthorp), Erdington, Nuneaton, Chilvers Coton, Market Harborough, also part of area of Midland Electric Light and Power Company.

Kent, 1902.—Dover River, Ewell parish, and Isle of Thanet.

In some few instances towns have been included by negotiation, but the general result has been the exclusion of the large towns possessing their own supply; but in the present session of Parliament the House of Lords Committee has decided that the city of Bristol shall be included within the area of supply of the Somerset and District Power Bill, and that the large towns shall be included within the area of supply of the North-Western Electricity and Power Gas Bill, and it remains to be seen whether the Committee of the House of Commons will follow the lead of the Committee of the House of Lords in this respect. The general scheme of a Power Bill is to cover a large area, to distribute at high tension to large individual consumers for power purposes, or to "authorised distributors" or "authorised undertakers" for power or light. They claim economy of working, cheapness of coal supply, and purport to offer a supply at a cheap rate. Below is given a list of some of the power companies and their authorised charges.

AS TO PRICE AND DIVIDENDS IN ACTS.

Title of Act.	Hours of supply per quarter.	Price.	Reduced Price.	Dividend	Standard Price regulating Dividend	Increased Dividend.	Reduced Dividend.
County of Durham, 1900.	100 over 100 over 200	4d.	2d. 1d.	£8	4d.	5s. for 1¼%	None
Lancashire, 1900.	100 200 over 400	4d	2d. 1d.	£8	4d.	5s. for 1¼%	None
North Metropolitan, 1900, 1902.	100 over 200	4d.	2d.	£8	4d.	5s. for 1¼%	5s. for 1¼%
Newcastle-on-Tyne, 1900, 1902.	00 under 400	7d. 6d.	1d.	£8	7d. 2½d.	4s. for 1¼%	4s. for 1¼%
South Wales Elec. Power Co., 1900, 1902.	400 over 400	3d.	2d.	£8	2½d.	5s. for 1¼%	5s. for 1¼%
Walker & Wallsend Gas Company, 1899.		7d.		Sec 72 £5	7d.	5s. for each ½d	5s. for each ½d
Clyde Valley, 1901.	400 over	3d.	2d	£8	2½d.	5s. for 1¼%	5s. for 1¼%
Cleveland & Durham 1901.	400 over 400	3d.	2d.	£8	2½d.	4s. for 1¼%	4s. for 1¼%
Derbyshire and Nottingham, 1901, 1902.	400	3d.	2d.	£8	2½d.	4s. for 1¼%	4s. for 1¼%
Shannon Water, 1901	200 under 400 over 400	3d. 3d.	2d.				
Yorkshire, 1901.	Charges per quarter 10s per E.H.P. plus 3d. per B.O.T.U. first 5000 2¾d. 10,000, 2½d. 20,000, 2d 50,000, 1½d. 100,000, 1d. 200,000, and over 200,000 ¾d., transformed, if necessary add 20% for supply to other than A U.			£8		4s. for 1¼%	4s. for 1¼%

Somerset Bill, 1903.	400	3d.	2d	£10	3d.	5s. for 1¼%	5s for 1¼%

The next table gives a list of large companies now at work showing the charges they are now making for power and light, from which we give the following extracts of lowest figures:

City of London and Electric Corporation.—Lighting: March and December quarters, 8d. for first six per 8 c.p., 2d. after; June and September quarters, 8d. for first three per 8 c.p., 2d. after. Power: 2½d. first 250 units each quarter per kilowatt of maximum demand (1d. unit in excess net) on a three years' agreement.

Newcastle and District Electric Supply Company.—Lighting: 4½d. maximum charge, 5 per cent. off accounts paid by March 10 follow-

Digitized by Google

ing issue. Power: 2½d. first 200 hours per quarter, 1d. after on maximum demand system; 1½d. flat rate if desired.

Newcastle Electric Supply Company.—Lighting: 4½d. and 1d. on the maximum demand indicator system. Power: 1½d. per unit flat rate.

Trafford Park.—Lighting: 4d. up to 400 hours per annum, 1½d. for all in excess. Power: 1½d. for first 1,200 hours per annum, ½d. for all in excess.

From the corresponding list of large towns with municipal supply we take the following:

Bradford.—Lighting: 4½d. per unit, less 2½ per cent. discount and free supply of incandescent lamps. Power: 1d. per unit net continuous use during working hours per day; heating and intermittent power, 2d.

Bristol.—Lighting: 5d. per unit evening, 3½d. other times, subject to sliding scale of discounts up to 30 per cent. on quarterly account of £500 in winter, £250 in summer. Power and intermittent power: 1½d., subject to discount up to 20 per cent. on quarterly account of £600.

Edinburgh.—Lighting: 3½d., consumers using 1,000 units and above are entitled to rebates up to 25 per cent. for 60,000 units or over. Power: 1½d. net, with minimum charge of 40s. per annum if energy is measured by separate meter; or 1d. per unit for power used continuously, with the exception that if used during the hours of maximum load for the four winter months, the price then is to be at the lighting rate.—A minimum rate of £20 per annum will be charged in the account for the term ending May 15 to consumers whose consumption during the preceding 12 months does not exceed 604 units for lighting purposes.

Hammersmith.—Lighting: 6d. first hour, 3d. for all additional consumption; 2½d. per unit, with rental charge of 1s. 3d. per quarter per 8 c.p., minimum charge 13s. 4d. per quarter. Power: 1½d. all current consumed daytime; if used between the hours of 6.30 p.m. and midnight a further charge of £1 per month per kilowatt demanded during those hours is made; 2½d. per unit flat rate; heating, etc., 2½d. flat rate.

Liverpool.—Lighting: 3½d. up to 3,000 units per quarter, and 3d. in excess. Power: 2d. up to 3,000 units per quarter; 1½d. in excess of 3,000 units per quarter.

The following are the charges now being made by the few power companies now in operation for the supply of power, so far as it has been possible to ascertain them:

Durham.—4½d. and 1½d., with discounts according to the load taken up to 41 per cent.

Gateshead and Jarrow.—4d. and 1½d., with discounts according to the load taken up to 41 per cent.

Midland Power Company.—1½d., or on the Wright system 3d. for the first hour and ·825d. after.

North Metropolitan.—7d. first hour, 1½d. after, with discounts.

South Wales Power Company.—Under 100,000 units per annum, 1⅞d.; 100,000 to 150,000, 1¾d; 150,000 to 200,000, 1⅝d.; 200,000 to 250,000, 1½d.; 250,000 to 500,000, 1⅜d.; 500,000 to 750,000, 1¼d.; 750,000 to 1,000,000, 1⅛d.; and over 1,000,000 per annum, 1d.

From these tables it will be seen that the municipalities are supplying current for power and light at a much cheaper rate than the average company, and the author sees no reason why, when municipal power loads grow, they may not supply current for power purposes cheaper than a power company, as they now supply cheaper for lighting purposes than the average lighting company, and as they are now supplying at a much cheaper rate than the authorised price given to companies; but it may be properly said that the power companies never hope to obtain the prices they fix as their maximum, but if this is the fact, it may reasonably be asked, Why fix the price so high? what possible use is it to fix a large price and take the discredit of doing so, when you know that you can never in the course of your business get it? A little further consideration will show why this is done; there is a "sliding scale" to be considered.

The author's idea of the proper function of a sliding scale is to induce company directors to secure an economical and efficient management, whereby the consumer obtains the article he requires at the cheapest possible rate, and the shareholders of the company participate in the economies by receiving an increased dividend as the price of the article is reduced; but if you wish to avoid responsibilities and still secure increased dividends you have only to fix your "standard price" sufficiently high to secure expensive and inefficient management and still high dividends to the shareholders. The author puts the case with which he is most familiar, that of the Somerset and District Electric Power Bill of this session, in which case he thinks the financial clauses are unsatisfactory.

Power is taken to issue £750,000 ordinary shares of £1 each, and also to borrow £250,000 under conditions to which it is unnecessary to refer. The dividend is limited to £10 per cent. per annum on the "*capital of the company*," but the company may in addition to the dividends authorised under the Act make good any deficiency in any previous dividends which have fallen below the standard rate of dividend.

Power is taken to divide the shares into "*preferred half shares*" and "*deferred half shares*," thus securing the benefit of preference shares to the serious injury of the customers of the company, because, as the £10 per cent. dividend is payable on the capital of the company, the company can charge £10 per cent. on the whole capital, including the "preferred half shares," as against the customers of the company, although it does not pay it to the holder of the "preferred half share," but applies it to increase the dividend of the "deferred half share." The result of doing this business in this way is to charge the consumer £10 per year for each £100 of the capital of the company, whilst if the capital was raised by means of preference shares and ordinary shares the preference shares would receive, say, £5 per cent., and the ordinary shares would receive £10 per cent., and assuming both classes of shares to be equal, it would cost the consumer £7. 10s. for each £100 of the capital, subject to a slight variation if a greater number of one class shares than the other were issued. The extra £2. 10s. per share interest will increase the dividend on the "deferred half shares" to £15 per cent. per annum, instead of £10, as stipulated in the Bill. This increased charge of £2. 10s. per cent. to the consumer means that before he can claim a reduction in the price for the current, he must pay at the rate of £25 per 1,000 extra for the capital of the company, which will amount, when the whole £750,000 of the capital is called up, to an extra charge of £18,750 per year on the users of the current. In addition to this, the arrangements proposed as to the "relations between price and dividend" are, the author thinks, unsatisfactory. The standard rate of dividend is fixed at £10 per cent., and the standard price at 3d. per unit (these figures were altered by agreement to £8 for standard rate of dividend and 2½d. standard price.)

Provision is then made for an increased dividend of 5s. per cent. in respect of each 1¼ per cent. by which the average price charged by the company has been below the standard price. Putting it shortly, the dividend is increased £1 per cent. for each £5 per cent., the price charged by the company is reduced below the standard price of 3d.

If the company succeeds in selling its current at the price now charged by Bristol (omitting all reference to discount)—namely, 1½d. per unit—the actual price would be £50 per cent. below the "standard price" authorised; and as the shareholders are entitled to £1 per cent. dividend for each £5 per cent. reduction in the price charged, they will be entitled to a £10 per cent. dividend in respect of the reduction of 50 per cent. They would thus be able to obtain an additional £10 per cent. dividend on the whole capital of the company; and as none of this additional interest would be payable to the holder of the "preferred share," it would be sufficient to double the £10 per cent. interest on the "deferred share" and increase it to £20 per cent., in addition to the £15 per cent. secured, as I have before explained, thus securing a right to receive £35 per cent. and not £10 per cent. dividend as stipulated in the Bill.

We have here the sliding scale at its best in the interests of the company, but can the same be said for the consumers; and it is fair to the promoters of this Bill to say that they are not much worse than their fellow-promoters. Parliament, in its wisdom or otherwise, has reduced the sliding-scale system to the point of absurdity.

A large town having a large demand may and does, as a rule, run its undertaking at a cheaper rate than a company, as will be seen from the table below, and it generally runs it at a profitable rate also.

RETURNS OF METROPOLITAN ELECTRIC UNDERTAKINGS.

Extract from *Electrical Engineer*, Oct. 17, 1902.

Cost of plant to companies, 19·2 per cent. more than municipalities.

Charges by companies to consumers, 32 per cent. per unit more than municipalities.

Costs of production, 8·8 per cent. more than municipalities.

RETURNS OF PROVINCIAL ELECTRIC LIGHTING UNDERTAKINGS.

Cost of plant to companies, 25·5 per cent. more than municipalities.

Charges by companies to consumers, 41·4 per cent. per unit more than municipalities.

Costs of production, 33·6 per cent. more than municipalities.

It will, the author thinks, be clear from the foregoing remarks and the figures quoted that, so far as large towns are concerned, a power company has nothing to offer in the best interests of the consumers.

There are many reasons for this: first, corporations pay in cash, and therefore get cash terms, companies frequently do not; secondly, corporations are not tied in any way to manufacturers as companies sometimes are; thirdly, corporations have no watered capital, usually represented by promotion and other expenses in companies' accounts; fourthly, the credit of corporations is firmer and capital is raised cheaper by them than by companies—indeed, the relative decline in municipal credit is not so great as the decline in the national credit as represented by consols, even allowing for the reduction in the rate of interest on the latter; fifthly, corporations always can and generally do command the best engineering talent in the market. In the face of these facts the figures given before cause no surprise; we might legitimately express both surprise and regret were it otherwise.

It must not, however, be assumed that because a large town

Digitized by Google

with a large demand proves a success that every small town can of necessity do the same with a small load, and here the author sees a sphere of utility for a power company while confining its attentions to the power load. It may, by linking up a number of small towns and supplying them in bulk for lighting, leaving them to distribute, be useful to the towns and profitable to themselves; and if with a power load supply a traction load can be obtained, whether running upon rails or not, and if in addition their traction cables could be used for the supply of small motors to small factories or private houses situate on the route of the cables, the company may be still more useful to the district in which it works and profitable to themselves. If they are to do this successfully, there must be an end of the attempts to obtain lighting powers by a side wind, as is now so often done, and companies must accept the position of wholesale dealers only, and not seek to become retailers in addition, in opposition to the local authorities; it should seek the good-will of localities and work with them by supplying in bulk, rather than against them by attempting to obtain lighting orders themselves; if companies went on these lines, useless and expensive parliamentary fights would be avoided.

It is idle to disguise the fact that the author approached the consideration of this question from the municipal side, and makes no pretence of being able wholly to get rid of his natural prejudice in favour of the work in which he is engaged, but he has endeavoured to place this question fairly before the association as it strikes him at the moment, leaving the discussion in their hands, with a view of assisting, if possible, in finding some common ground of agreement between power companies and municipalities, whereby they may be able to avoid competition, which may become injurious to municipalities and ruinous to companies.

Mr. A. B. MOUNTAIN, of Huddersfield, agreed with the author that in large towns the local stations could supply electrical energy quite as cheap as a power company—in fact, he thought past experience proved that they could supply more cheaply. With regard to the smaller towns, it was a moot point whether the local interest secured by municipal ownership should not more than compensate for the advantages claimed by private enterprise.

Mr. R. S. PORTHEIM said that as the paper showed cables were the greatest outlay the power companies had to incur, with overhead lines they could reduce the cost of trunk mains from £6,000 to £600 per mile. He looked upon this as being the crux of economic power distribution.

Major-General WEBBER said that in 1830 an Act was passed to facilitate the construction of direct railway lines from coal-pits to large consuming districts. This Act had been scarcely used at all, but he thought a similar Act was required to enable electric power mains to be carried out radially from power stations to large consumers. An examination of Ordnance maps would show that a straight line drawn through a county in England crossed, as a rule, six or seven fences in a mile. This meant three supports for the cables in the average field, which could not be looked upon as being obstructive to agriculture.

Owing to the paper having been taken as read, the discussion was then adjourned until Friday to give members a chance to peruse it.

Mr. J. J. STEINITZ opened the discussion in Middlesbrough. He asked on what grounds companies should be excluded from towns when they only asked for permissive powers to supply. Those towns which gave a cheap supply of electrical energy had nothing to fear. He was pleased to say that the West Ham Corporation, which might rightly be considered an extremely liberal one, did not hesitate to give a power company this permissive right. As regards the figures of cost of supply, he said that the Newcastle-on-Tyne Supply Company received only 1·85d. per unit, while the County of Durham Power Company only obtained on the average 1·43d. These were below the average prices for large towns, and he thought that the people should be allowed to have the cheapest supply.

Mr. R. A. CHATTOCK, of Bradford, said there was a strong objection to allowing the streets to be pulled up by the power company when these streets were already well filled with other mains. He thought the corporations did not object to cheap supply, but that the other objections to the power company was such that if these companies could not show considerably reduced charges, it would be inadvisable to admit them into the town.

Mr. ROBERT HAMMOND informed those present that the Somerset Electric Power Bill had been passed by the committee of the House of Commons. It was a curious fact that until recently no concurrent powers had been given against municipalities, who thought they had protection as long as they did their work well. He suggested that this competition was equally inadvisable with electric power as it had been proved to be with gas supply. The comparison Mr. Steinitz had made between the average figures and those for Newcastle-on-Tyne was not fair. They must also remember that the power companies were able to offer under their Bills discriminating rates, which was not the case under an electric lighting order.

Mr. W. L. MADGEN said that the North Metropolitan Electric Power Company had contracts in hand for furnishing 15,000,000 units per annum at rates from 1d. up to 1·4d. It was unfair to compare figures in the schedules as Alderman Pearson had done. There were certain municipal stations in London, such as those of Islington and St. Pancras, which were not any too successful, and which did not supply at cheap rates. He noted that Alderman Pearson said that corporations could command the best engineering talent. Companies could not issue royal commands in this way, but they enlisted the services of good engineers.

Bailey MACLAY, of Glasgow, urged those present to do good work, and not to waste time in fighting against invidious articles in the Press.

Mr. R. C. QUIN said that they must do justice to the power companies, and he did not think the paper before them was quite fair. They must remember when comparing figures as to capital cost that the pioneering work of electric lighting was done in London. In the country, on the other hand, all the best towns, from an electric supply point of view, were in the hands of the municipalities, who ought to be ashamed if they could not do better than electrical companies in small towns. He quite agreed that electrical companies could buy for cash more cheaply than municipalities, owing to the stringent labour and other clauses which corporations inserted in their specifications for plant. In any case, he thought that electric energy should be supplied from large stations in the future, and it might well be that municipalities would join together in establishing such stations. In any case, wholesale supply must come.

Mr. J. E. EDGCOME, of Kingston-on-Thames, said that it was not right for Parliament to first give powers to corporations and then, after a supply has been established, to let the companies come in and take over the best consumers.

A vote of thanks was then given to Alderman Pearson for his interesting paper.

The following was the next paper taken

Electric Traction as Applied to the Newcastle Tramways.

BY A. E L. ROSSIGNOL, GENERAL MANAGER AND ENGINEER, NEWCASTLE CORPORATION TRAMWAYS.

Every system of electric power supply is influenced in its general design by the requirements of the system it has to supply with power, and by the local conditions affecting the sites available for the power station, their position with reference to the system to be supplied, and also to the supply of fuel and water supply for condensing purposes. The site finally adopted does not as a rule fulfil all the ideal requirements, but is generally the result of a compromise which forces the power station to develop along certain lines and lays down definite limits of economy of working costs, and these limits can only be altered by extra expenditure of capital. The latter may overcome some of the difficulties presented by the position of the site and enable greater economy to be attained than would otherwise be the case, but at the same time involves extra charges against revenue on account of interest and redemption. Ultimate real economy can only be obtained if these extra charges are less than the working costs which would otherwise be necessary if this extra capital expenditure had not been made, and the author thought it might be of interest if in this paper he attempted some investigation into the influence of such additional capital expenditure on the cost of current at the tramway power station in Newcastle. He proposes to take as a basis an output of 7,000,000 units per annum, which will be approximately the output for the present year, and to show on that basis the influence of the different factors on the cost per unit.

Digitized by Google

The town of Newcastle is built on the north side of the River Tyne, and the tramway system is, therefore, fan-shaped in outline, corresponding with the development of the town along the river bank. The Corporation possessed land practically at the centre of the fan, and this land, consisting as it did of an old valley filled in with loose earth, was not of great value for building purposes, and so was handed over to the Tramways Committee for the power station site. It had the advantage of being nearly at the centre of gravity of the system, so that direct current at 500 volts could be used with very little loss in feeders, but it had the disadvantage of being a quarter of a mile from the river and at a height of some 80ft. above low-water mark, so that condensing water would be costly to obtain, and it had also the disadvantage, though alongside the railway, of being situated at one of the busiest parts of the line, and, therefore, it would be difficult to arrange shunting facilities for the coal wagons. Still another disadvantage lay in the fact that the land was all filled in ground, and therefore expensive foundations were necessary; but, on the other hand, its value was low for the same reason. The foundation for the chimney was effected by excavating a space 30ft. square and driving piles to the number of 49 over this area. These piles only penetrated some 20ft. through the earth, and there is every reason to believe their further progress was stopped by an old stone-paved road which formerly existed in the valley at this spot. On the top of these piles a block of concrete was formed, 15ft. deep by 30ft. square, and on this the octagonal brick chimney was erected. The foundations for the rest of the buildings consisted of blocks of concrete interlaced with steel rails, which were bolted together throughout their length to give strength, and these blocks, one for the boiler-house and one for the engine-house, practically float across the former valley on the soft filled-in earth. Where some of the original hard ground of the sides of the valley was encountered at the ends of the engine-house block, it was excavated and filled in soft so as not to convert the block of concrete into a huge girder, resting on supports at its two ends, should the ground in the centre of the valley subside in any way. The buildings erected on these foundations consist of steel stanchion frameworks, on which the roofs were erected first of all and the sides afterwards filled in with brick walls; the engine-house first erected, being large enough for three times the present output, and built so as to be capable of easy extension, whilst the boiler-house was only large enough for the present output, and is now being extended. As the firing floor level is considerably below the railway level and parallel with it, the steel framework of the building was extended along the site so as to form a double-track viaduct for the accommodation of trains of coal wagons, and to enable easy extensions of the boiler-house to be made by the filling in of this framework with walls, roofs, and coal bunkers.

In the present boiler-house eight Lancashire boilers, 30ft. by 8ft. 6in. diameter, were installed together with superheaters to three boilers and an economiser of 480 pipes, whilst the water-feed arrangements consist of a Weir pump, injectors, and a double-armature three-throw electric pump, with specially large feed-water tank as a reserve in case of a failure of the water supply. Above the firing floor is a large self-trimming coal bunker, so arranged that the oldest coal discharges first, thus avoiding as much as possible the risk of self-combustion to which the small Northumbrian coal used is very liable if stored for any length of time. The railway wagons are handled on the tracks above the bunkers by an electric locomotive, and discharge direct through their trap doors into the bunker below. From the bottom of the bunker the coal falls through an automatic weighing machine above each boiler, and is delivered by that machine as and when required into the hoppers of the automatic stoker below. The ash and clinker raked out of the fires falls into small wagons in the ash space below the firing floor, and is wheeled along to an electric lift and elevated into a bunker from which it is discharged into carts. Lancashire boilers are very satisfactory for use with a tramway load, as they contain at all times a large reserve of power in the shape of water heated to the steaming pressure, but their efficiency and life depends on the care taken of them, and, therefore, each boiler is thoroughly cleaned once in eight weeks, inside and out, mountings overhauled, and flues cleaned.

In the engine-house there are four generating sets, whilst a fifth one of 3,000 h.p. is being added; the present sets are all vertical engines, coupled direct to compound-wound direct-current dynamos. One engine is of triple-expansion high-speed type, giving an output of 400 kw.; two others are of compound slow-speed type with Corliss gear, each giving an output of 635 kw.; and the fourth is of triple-expansion slow-speed type with Corliss gear, giving an output of 1,300 kw. From the dynamos the current passes by the ordinary type of traction switchboard to the various feeders for tramway and lighting work. In the engine-house there is also a motor-driven booster for charging a battery of 1,500 ampere-hour capacity placed at the top of the office block. For securing an ample supply of water for the surface of condensers attached to each engine, the following special arrangements were adopted. The whole of the river bank at this part is occupied by a wharf, at the back of which a site was obtained, excavated to about high-water mark, and concrete retaining walls, and roof formed for a pump-house. Two 15in. suction pipes lead from apertures pierced through the quay wall below low-water mark, across the wharf to the pump-house, where two high-lift centrifugal pumps draw the water from the river and force it through a 24in. pipe to the power station. After passing through the surface condensers there it returns by another 24in. pipe to the pumping station, where the water passes through a turbine on the end of each centrifugal pump shaft, and returns to the pump about 50 per cent. of the power used to pump the water up, the remainder of the power being supplied by an electric motor mounted on the same shaft.

From the foregoing description it will be seen that an attempt has been made to get over the two chief disadvantages of the site—namely, the difficulty in the supply of fuel and in the supply of condensing water—by the expenditure of additional capital, and the author has worked out in the following table the total cost of producing energy, including all capital

TOTAL COST PER UNIT FOR GENERATING ENERGY, INCLUDING ALL LABOUR, MATERIALS, MAINTENANCE, CAPITAL CHARGES, DEPRECIATION AND MANAGEMENT EXPENSES.

	ITEMS OF EXPENDITURE.	COST PER UNIT in pence, based on an output of 7,000,000 units per annum.
PART A. Total Charges for supply, handling, and disposing of Fuel 0·194.	Capital Charges on cost of Land for Siding ..	0·003
	,, ,, Bunkers and Siding .	0·010
	,, ,, Automatic Weighing Machines and Stokers	0·006
	Annual Charges for Maintenance and Repair of above	0·002

0·880.	Total Cost per Unit	0·880

charges, depreciation, taxes, etc., and has added management expenses, assuming that the power station was run as a separate concern. If the extra capital expenditure on the siding and coal bunkers had not been made, it is, of course, only possible to estimate what effect the carting of fuel and hand firing would have had on the cost per unit, but from enquiries the author made at the time, the cost would not have been less than the following revision of part A of the table of costs shows:

Cost of fuel used	0·180
Labour, trimming coal	0·005
Labour, stoking	0·029
Labour and energy for disposing of ashes	0·007
	0·221

as against a cost for part A in the other table of 0·194, or an increase of total cost of 0·907d. per unit. Had the extra expenditure for the condensing plant not been made, part D of the table of costs would not have existed, but the coal consumption and water consumption would have increased, and, in addition, the plant would not have been capable of giving the same output that it gives at present. On one

Digitized by Google

occasion, when one of the circulating water mains broke down, the engine plant was running non-condensing for five days, and it was found that the coal expenditure had increased 50 per cent. over any five similar days, therefore the costs would not have been less than the following:

Increase in cost of fuel	·070
Increase in cost of water	·003
	·073

a total increase of ·073d. per unit against a saving of 0·056 by the abolition of the condensing plant, or an increase of total cost to 0·897d. per unit, whilst in addition the plant would not have been running under such favourable conditions or have been capable of giving the same output.

Mr. ROBERT QUIN opened the discussion, and commended the author for the very clear paper he had presented. It would have been even more interesting if they had seen the station before hearing the paper. Considering the difficulties of the site, the scheme seemed a very courageous one, and these difficulties had by the author's showing been successfully overcome. To work a condensing plant from a water supply half a mile away with 88ft. rise was quite an undertaking. He did not like the piling as described by the author, as it seemed to him the chimney was resting on an old road, the foundations of which might give way. He quite concurred with the author in the use of Lancashire boilers.

Dr. PANTON, of Bolton, said he was much interested in the paper, the figures in which would be of great service to those who had to advise as to the prices to charge for electrical energy for tramways when supplied from a combined station. It seemed to him that the figures for rent, rates, and taxes were low, as was also the management charge. He would like to know where the energy was metered, and if the mains were included in the capital charge on the station.

Mr. R. A. CHATTOCK, of Birmingham, said the condensing plant was a most interesting one Some years ago he had seen something of the same sort attempted, in which the water falling 26ft. into a river assisted a circulating pump. Mr. Le Rossignol's scheme went farther, and he congratulated him on the results. He would like to know what was the load factor at the station and what was the loan period. He should think that the items for repairs would increase in the future.

Mr. R. BIRKETT, of Burnley, said that he had gone into the question of charges for tramway current, which might be 1·5d. per unit if no cables were required, but with the cost of cables to supply the tramways added, the charge would rise to 1·78d.

Mr. H. COLLINGS BISHOP, of Newport, also criticised the item for repairs as being too low.

Mr. LE ROSSIGNOL, in reply, said that it was only a supposition that the piles were stopped by an old road. The old maps indicated that there had been a road under the site, but were not exact enough to determine its position. The fact that the piles could not be driven further showed, he thought, that a satisfactory foundation had been obtained. The thermal storage of energy in the large amount of water in the Lancashire boilers was a great assistance to a tramway plant in meeting sudden demand for more output. The figures of cost per unit were those of last year, when the output was 6,000,000 units. The capital charges worked out at just over 7 per cent. As regards cost of repairs, he had divided up the items, which totalled ·04d., not ·02d. The mains had cost £10,000. Their maximum load was 2,920 kw., and the average load 800 kw., which gave a load factor of 28 per cent. The current was measured at the switchboard in the station.

A vote of thanks was then passed to the author for his paper.

The meeting on Saturday at Sunderland was a business one only, being the annual general meeting of the association. The election of officers resulted in Mr. T. P. Wilmshurst, the senior vice-president, being unanimously elected president. Following the usual precedent, the next convention will be held at Derby—*i.e.*, the town in which Mr. Wilmshurst holds office. Messrs. F. A. Newington and R. A. Chattock were elected vice-presidents. Alderman J. Pearson was re-elected hon. solicitor, and Mr. J. H. Rider was re-elected hon. treasurer. Mr. E. T. R. Murray retired from the position of hon. secretary, and the vacancy was filled by the unanimous election of Mr. J. E. Edgcome.

The President then presented the prizes won by the associates for papers on subjects connected with municipal electrical engineering. The first prize—a case of instruments worth £5. 5s.—was won by Mr. C. L. E. Stewart; and the second—books to the value of £3. 3s.—was won by Mr. F. W. Hewitt. Mr. Stewart, in returning thanks, expressed the opinion that the prize papers should be open to discussion.

The Hon. Treasurer submitted the annual balance-sheet, which showed that there was a credit balance on the year's working of £8. 16s. 11d., notwithstanding the adverse balance of £50 with which the year was commenced. The total balance to the credit of the association was £183. 0s. 7d.

The balance-sheet was adopted.

The annual report of the council stated that there had been a satisfactory increase in the membership, which had reached 356. Of these 65 had been elected since the last convention. Seven members and four associates had resigned, 16 memberships, two associate-memberships, and six associateships had lapsed, and four members had been removed from the roll.

Guard Wires.—The proposed "emergency rules" as revised at the last convention had been forwarded to all municipal tramway committees and engineers, asking for their suggestions with a view to further revision. A number of suggestions were received and adopted, and the revised rules again circulated for final consideration before being submitted to that annual meeting. The following are the revised rules:

1. In the event of telephone or telegraph wires falling and making contact with the overhead trolley wire, or in the event of the trolley wire itself or its guard wires falling, all traffic in the close vicinity of the wires should be stopped, and the public prevented from approaching the fallen wires.

2. The fallen wires should on no account be interfered with by the police or any unauthorised person unless for the purpose of saving life or protecting persons from being injured, as explained in Rule 5.

3. Notice should be at once given to the nearest car driver, inspector, or other tramway official, who will take steps to cut off the current. If such official is not available, notice should be at once sent to the nearest tramway depôt by telephone or messenger in a cab with a request for someone in authority to proceed at once to the spot to deal with fallen wires. These depôts are as follows: (Here will follow list of depôts.)

4. Drivers of cars should not be called upon to interfere with the fallen wires, unless it is for the purpose of saving life or preventing persons from being injured.

5. If the fallen wire is in contact with any person, and it is necessary to remove it at once in order to save life or prevent injury, the following points should be remembered: The person removing the wire should (*a*) never touch it with his bare hands or damp gloves. (*b*) Never touch the person in contact with it, except as mentioned in (*c*). (*c*) Use a dry stick, dry rope, or article of dry clothing, or indiarubber gloves if available, to drag the wire away, or to drag the person away from the wire. Note that it is very important that any article used for this purpose should be dry; a wet article will convey the electric current, and may give the person handling it a severe shock. (*d*) In case it is impossible to get the wire away from the person, the wire should be dragged to the nearest tramrail, and held down upon it, in order to discharge the current from it. A considerable amount of flashing may be caused when the wire touches the rail, but this will not cause injury in any way.

6. Each car will carry a pair of indiarubber gloves, and these should always be used.

7. Animation can often be restored by treating persons suffering from electric shock in a similar way to persons rescued from drowning.

The Postmaster-General has since intimated a desire to

Digitized by Google

have these rules printed and distributed for the use of the Post Office engineering staff. It was intended to send a deputation from the association to the Board of Trade and the Post Office with a view of obtaining some modification in the proposed regulations as to overhead wires, but on the understanding that these regulations were already under revision, and likely to be practically identical with the views of the association, it was decided not to proceed in the manner proposed, but to send to both authorities a copy of the following resolution: "That, in the opinion of this association, experience has proved the use of guard wires to be a source of danger to the public, and as there are other and more satisfactory means of protecting telegraph and telephone wires, that the use of guard wires should be abolished wherever possible." The Board of Trade afterwards determined that, among others, the following members of the association should be consulted with reference to the proposed revision of the regulations: Messrs. W. A. Chamen and A. B. Holmes, and the council agreed to their representing the association. It is understood the regulations when revised will not be of an inflexible character, but open to alteration from time to time, as circumstances may require. In September last a parliamentary committee was appointed.

The council had had under consideration a suggestion made by Mr. T. D. Clothier at the last convention with regard to the advantages to be derived from affiliating the students in technical colleges with the association. The council did not see its way to putting the suggestions into practice, but thought it was a matter which might well be taken up by electrical engineers locally, and dealt with individually.

The council recorded with satisfaction the increasing support given to the association by municipal electrical engineers and electricity and tramways committees, the membership being the highest yet recorded.

The PRESIDENT moved the adoption of the report, with the addition of a recommendation that only members of the association and invited guests should be eligible to attend future meetings and functions. He pointed out that the association was growing in membership, and it was becoming a great tax upon the corporations of the towns in which they held their meetings, although he agreed that there was no need for such entertainment by any town to which they might go in the future.

The report was adopted.

The election of the council resulted as follows: Messrs. J. Christie, Brighton; H. Kilgour, Cheltenham; J. K. Brydges, Eastbourne; J. Talbot, Nottingham; Alderman Dowson, Doncaster; Captain Davison, Harrogate; Alderman Smith, Barrow; Bailie McKenzie, Edinburgh; and Dr. Panton, Bolton.

The Parliamentary Committee of the association in their report recommended, among other matters, that the proposed Bill as to tramway workers' hours of labour should be opposed. The Bill provides that no tramway worker shall in any one day of 24 hours be employed for a period exceeding eight hours, and that the period should be continuous, and include such a reasonable time for one meal as may be fixed by the Board of Trade.

The adoption of the report having been moved,

Mr. A. ELLIS, of Cardiff, spoke of the many advantages which tramway employés had under a corporation as compared with a company, and said the continuous adding to these advantages was going to have a serious effect upon the municipalisation of tramways and electric light. At Cardiff the men had advantages which he believed obtained in no other town in the United Kingdom. For instance, a man was not compelled to work on Sundays if he stated that he had a conscientious objection. Consequently in the summer months it was almost impossible to get sufficient men to run the service. Then they had to pay men time and a half for Sunday. He could not see why this should be done, for though a tramway was essentially a seven days' undertaking, it did not necessarily follow that the men should work seven days. They could have a day off during the week. The Corporation was not allowed to work the men more than 54 hours a week, and on Bank Holidays and national holidays they received double pay if they worked, and the surplus receipts that were depended upon were thus taken away. In addition to this, the men who did not work got a day's pay, so they were practically paying men to take holiday. One really did not know where the conditions of employment were going to end. He then criticised the provisions of the Act. He did not think any man should be compelled to stand on the front of his car for eight hours on end, and if the men had to get their meal on the car the service would be spoilt by the men rushing their cars to the termini in order that they might sit down inside and take their food. He hoped the Bill would be opposed.

Dr. PANTON, of Bolton, expressed the opinion that they, as an association, could not oppose the Bill. They were not tramway people, and all they could do was to express the opinion that it should not be passed.

Another member said he could not pledge his corporation in the matter.

Mr. ELLIS said that he did not desire that the association should go beyond its powers. He simply wanted it to do what it could against the Bill.

The report was adopted.

Votes of thanks were accorded to the president for his services during his term of office, and it was agreed to forward letters of thanks to the corporations and firms who had extended their hospitality to the association during the week.

Thus ended a most successful meeting, and one for which Mr. Snell and the North-country electrical engineers are to be congratulated.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

603. Why do some firms use a star and mesh starting switch on squirrel-cage three-phase motors, and does star coupling increase the torque and reduce the current taken for a given starting torque, or is the torque greater when mesh coupled, the turns per phase being the same in each case?—W. A. S.

604. Describe how the two motors on an electric tramcar are connected up when braking with rheostatic brake, giving sketch showing path of current.—O. J.

ANSWERS.

Question No. 595.—(1) Discuss by aid of diagrams an arrangement whereby sections of a low-tension three-wire network may be readily isolated from one another in the event of a fault occurring on any one of them, it being understood that each section is fed by a feeder; (2) in reference to above, when the sound sections are fed from a common discharge bar, would anything unusual occur on the distributors should the faulty section be dealt with on a spare bar, considering that the outers only were disconnected and that the middle wire was continuous throughout?

Best Answer to No. 595 (*awarded* 10*s.*).—(1) There are several methods of arranging for isolating or disconnecting the various sections of a three-wire network. In nearly all cases, however, it is the practice to make the middle wire continuous, or put in links, which can only be taken out by hand. It is usual to put fuses at intervals in the outers of the distributors, and fix disconnecting boxes at the branching points. These disconnecting boxes are usually made with links, though in some cases fuses are put in the outers and a link in the middle wire. Where the latter system is adopted, in the event of a "fault," say an "earth" or a "short," occurring on a distributor, the fuses at each end of the faulty section would blow,

Digitized by Google

owing to the excessive current, and cut off supply, the advantage in this case being that only a short section of distributor is affected by the fault. The system referred to in the second part of this question would appear to be one in which the distributor is split up into large sections by fuses on the outers at rare intervals, each section being fed by a feeder (see Fig. 1). The writer does not in this matter consider three-wire feeders, but assumes that the middle wire is connected to the supply station at two or three points, and that the middle wire is earthed at the works. In this case, should a fault occur, say, at F, then the excessive load put on A feeder will either blow the feeder fuses, or cause such a large drop in pressure on the same feeder that the fuses at each end of the faulty section will blow owing to the excessive current flowing from the two other sections. Should this happen, it would probably be best to connect the A feeder to a separate supply bar, though in many cases the fault would be of such a nature as to make it impossible to maintain the supply on that section of distributor. In any case, it would probably be advisable to disconnect the middle wire at both ends of the faulty section, if possible, for the reasons given later, though this could not be done if there was no middle-wire feeder connection on the damaged section.

2. Assuming that the "fault" is of such a nature as to allow of maintaining the supply on that section of distributor (as would be the case with a slight "earth," say on the +), then if the outers of the distributor are disconnected at each end the pressure could be increased on A feeder to meet the abnormal load on the + side. The middle would, however, have to carry the excess current returning from the faulty section, or, rather, the difference in current of the + and − sides, which would be great owing to the partial "short" on the + side. If the spare feeder bars could have a balancing set connected to them and the middle-wire feeder connected as shown, then the + balancer, B, would supply the extra current, and the sound distributors need not be affected, except in so far as the middle wire would be rather heavily loaded as far as the point O.

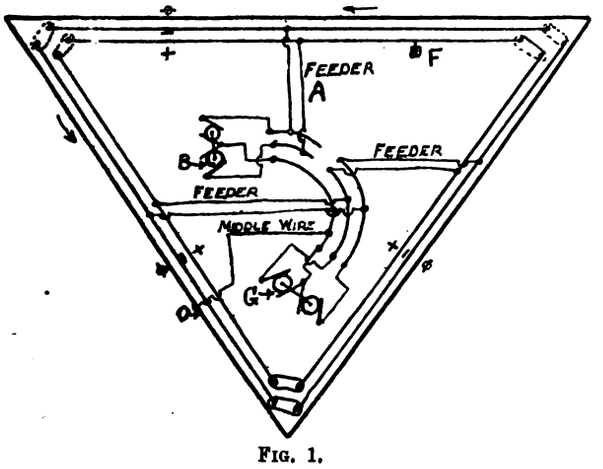

FIG. 1.

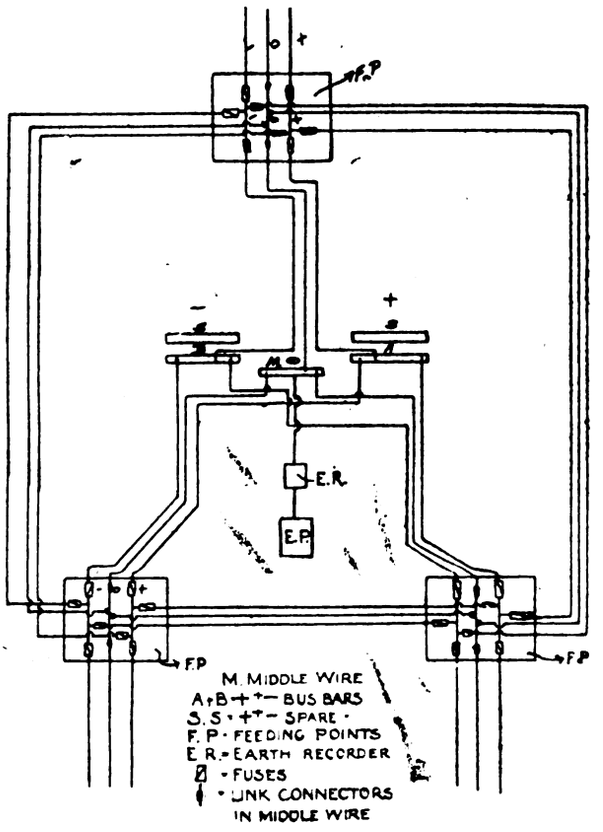
Supposing, however, that a balancing arrangement could not be connected to the spare feeder bars, then the balancer, G, would take up the extra current from the middle-wire feeder, and the result would be that the pressure on the + side of the sound distributors would be high. In the event of a "short" occurring between the outers of a section of distributor, as soon as this section is cut off from the remaining portion and supplied from separate feeder bars there will be no effect on the sound portions.—S. A. C.

Answer to No. 595 (*awarded* 7*s.* 6*d.*).—The accompanying diagram shows a three-wire low-tension network, arranged so that in the event of a fault on any one section the faulty section may be quickly removed. A and B are the positive and negative 'bus bars from which the supply is normally given, and S S are two spare 'bus bars for dealing separately with any section should it be required to do so. M is the middle-wire bar. The feeding cables are taken to the three feeding points, F P, F P, F P, as shown. They are here connected to their respective 'bus bars, the outers through fuses and the middle-wire feeders direct. The middle-wire feeders must never on any account be connected through fuses, as should these fuses blow disastrous consequences would result, should one side of the section be much more heavily loaded than the other.



The distributors are also taken off the 'bus bars through fuses in the case of the outers, and through a solid link in the case of middle-wire distributors, the same rule, of course, as to fusing the middle wire holding good for both the feeders and distributors. The three feeding points are connected by distributors, and on examination of the diagram it will be seen that any feeder can be dispensed with if faulty, the only drawback being that the drop of pressure will be greater than if all three feeders were in use. Should a bad earth develop on any section, and it is desired to keep running on that section without upsetting the rest of the system, all that is necessary is to isolate that particular section from the network, and feed it from the spare bars, S S, by connecting the particular feeder to the spare bars. In order to keep a balance on the faulty section the battery could be uncoupled from the outers, A and B, and connected to the spare bars, S S. Nothing unusual would happen by doing this and keeping the middle wire continuous throughout the system, as any current to earth from one of the outers on the faulty section would seek a return path through the earth to the station as long as the insulation of the middle wire was intact.

For the sake of simplicity in making and reading the diagram, the disconnecting boxes at the feeding points have been shown of the type built into brick pits, and containing the 'bus bars run in with bitumen, the connections to feeders and distributors being made by means of easily fitting links. But in the writer's opinion a feeding pillar equipped with the necessary 'bus bars, to which connection is made by means of switches capable of being opened whilst heavy currents are flowing, are far better, the objection that the switches will become stuck fast and corroded through damp and disuse being overcome by a *little* judicious attention at the time of inspecting the various feeder pillars.—W. T. W.

Answer to No. 595 (*awarded* 5*s.*).—Undoubtedly the best arrangement for isolating different sections from one another is to have sectionising fuse boxes inserted between each section, so that when one section breaks down the section connected to it may be worked all right after taking the "links" or fuse holders out between it and the faulty section. Suppose a fault suddenly occurs in network shown in Fig. 1. The switches at the station controlling feeders A and B must be taken out, and the fuse holders

Digitized by Google

at sectionising fuse box then taken out, and the switches at the station put in again (lightly fused) to see in which section the fault is, and the switch to the faulty section taken out again. Suppose the fault is on section D. Feeder B and section D are now dead, and the links should be taken out at feeder box B, and the feeder and section D tested separately to see in which the fault lays. If the fault is in the feeder, then the sectionising fuses should be put in again, and the two sections, C and D, both fed through feeder A.

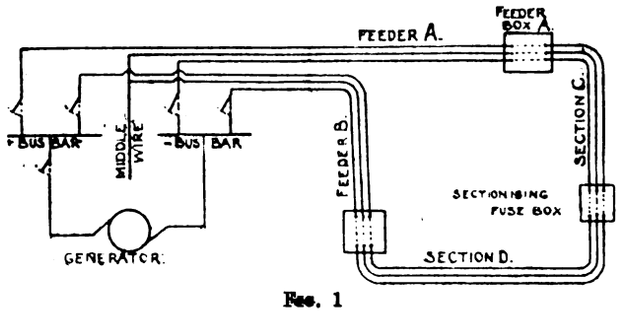


Fig. 1

With regard to the second part of the question, nothing unusual would occur, for the middle wire is always kept at earth potential. Suppose that if the fault, instead of being in the feeder (above), is found to be in section D, and the negative and middle wires are dead shorted. Then, of course, since the middle wire is at earth potential, the negative conductor would also be at earth potential, and the faulty section could be dealt with on a spare 'bus bar by a separate machine running at half the proper voltage across the outers. The negative and middle wire of the feeder supplying the faulty section must be joined together at the station. In this case only the installations tapped off the positive and middle wire would be able to get light. If the positive, negative, and middle wire of the faulty section are all dead shorted, then, of course, the section cannot be worked at all, unless it is divided up into two or more lengths with disconnecting link boxes between each length, in which case that part of the section found by testing to contain the fault can be isolated, by taking out the links at each end of it. The other parts of the section may then be dealt with through one or the other feeder, according to the position of the faulty length.—G. N. W.

Question No. 596.—A feed tank is situated some distance from the well from which it is to be filled. Two electrical pumps are to be installed (one being a stand-by) to fill the tank. Give a method of calculating best size of pipe (for a given discharge of water) to connect pump and tank.

Best Answer to No. 596 (*awarded* 10*s.*).—Such a case as the above is one which requires the consideration of all details. There are certain factors which have to be taken into account in the calculation of the best size of pipe to be used in the above connection. The best size of pipe is the one, of course, which will give the best satisfaction as regards working, and produce good results in efficiency and economy. It is assumed that the distance between the tank and the pump is known, as this is an essential factor to be considered. The water should be forced through the pipes by sufficient power to provide for useful work being done, and also for losses in the pipe. The losses occurring are due chiefly to the friction of the fluid upon the solid surface of the pipe, but this friction is independent of the pressure, depending chiefly on the hydraulic mean depth of the pipe, and within all ordinary limits may be taken as proportional to the square of the linear velocity. This linear velocity should, therefore, not be so great as to cause an enormous loss due to friction of the fluid upon the solid surfaces of the pipe, as all losses have to be paid for. A good average velocity of the water in pipes is 3ft. or 4ft. per second, or 180ft. to 240ft. per minute, and even this might, with satisfactory results, be generally less. With a pipe too small for its work, a linear velocity greater than the above would be obtained, and this greater velocity would produce a far greater proportional increase in friction, therefore would require more power to overcome that friction. It is, therefore, obvious that the larger the pipe up to certain limits, the less the loss of power required to overcome the friction produced. Also, though not indicated in the question as any given factor, the working pressure is an essential to be known—that is, the pressure which will be maintained at the end of the pipe and be available to supply the pressure lost in the pipe owing to the law of the conservation of energy. Now, this pressure lost in the pipe must be a decided factor, or the correct diameter cannot be calculated. Knowing all the above factors, a formula is required connecting them to the diameter. Various authorities from time to time have given different data as to results of their experiments and tests on the flow of water in pipes, and have produced formulæ likewise differing. Now, as these formulæ differ, and some greatly, it will be the best, in order to obtain a fair result, to take an average formula, one the average of them all. The mean of such formulæ may be taken as:

$$d = \sqrt[5]{\frac{W^2 \times L}{23{,}000^2 \times p}} = \sqrt[5]{\frac{W^2 \times L}{529{,}000{,}000 \times p}} = \frac{1}{55} \times \sqrt[5]{\frac{W^2 L}{p}}$$

where d = diameter of pipe (internal), in inches;
W = discharge of water, in pounds per hour;
L = length of pipe, in feet;
p = loss of pressure, in pounds per square inch.

This formula will give approximately the best size of pipe under the conditions represented in the question. The size will be such as not to produce a very high linear velocity. The loss of pressure might under ordinary conditions be equal to 1lb. per 100ft. of pipe. Assuming this in the above formula, for a discharge of, say, 400,000lb. per hour we shall get out a diameter of about 8in., which would be about the best size for the conditions prevailing.—G. W. B.

Answer to No. 596 (*awarded* 5*s.*).—The amount of water a given pipe can carry depends upon the pressure of the water at entering the pipe, and the quantity of water a pump can deliver is generally reckoned for practical purposes at two-thirds of the capacity of the cylinder or barrel multiplied by the number of strokes per minute, 277 cubic inches being reckoned as equal to one gallon. Of course, this is supposing the water to be pumped up from the well, and then to be allowed to run freely from the pump. Now, the question is, will it run to the place where it is wanted, or must it be forced there? If it will run there by the action of gravity only, we have a formula in Molesworth's book of engineering formulæ which exactly suits the case—viz., $G = \sqrt{\frac{(15\ D)^5\ H}{L}}$, where G = the number of gallons delivered per hour, H = the head of water in feet, D = the diameter of the pipe in inches, and L = the length of the pipe in yards. In words we may say: multiply the diameter of the pipe in inches by 15, then multiply this product together five times, and take the square root of the figures thus produced; then multiply this by the head of water—*i.e.*, the fall in feet—and divide the result by the number of yards the pipe is long This will give us the number of gallons which can be passed through a given pipe—*e.g.*, the size of the nozzle or delivery pipe of the pump, which would probably be a guide as to the fair amount to expect from the pump. The formula may be transposed to give the diameter of pipe required to deliver a certain number of gallons—thus:

$$D = \frac{1}{15} \sqrt[5]{\frac{G^2 L}{H}}.$$

A knowledge of logarithms will greatly facilitate the working of these formulæ, but the first can be worked with a little patience without logarithms. Valuable tables are also given by Molesworth. Of course, if the pump has to create the necessary pressure to raise the water to a higher level it has so much more work to do, and in this case probably the best thing to do would be to use a pipe the same size as the delivery pipe of the pump, but certainly not smaller, because a pipe which is too small causes so much friction that it puts too much work on the pump, and prevents it doing its proper amount of duty, and may often be the cause of a breakdown. Therefore, if the pipe is to be of great length, it would probably pay in the long run to have it a little too big rather than too small.—F. G. A.

Digitized by Google

Answer to No. 596 (*awarded* 5*s.*).—The chief sources of loss in head or pressure of water when flowing through pipes are friction and losses at bends and sluice valves (when the latter are partially closed) due to friction and eddies, the amount of loss depending on the shape and radius of bend and the amount of opening of sluice valve. The amount of water that will flow through a pipe per second in cubic feet when the resistance is wholly or chiefly friction is given by equation

$$Q = 30 \sqrt{\frac{h}{l}} \times d^{\frac{5}{2}},$$

where Q = volume in cubic feet per second;
l = length of pipe, in feet;
d = diameter of pipe, in feet;
h = loss of head due to friction = difference of head at ends of pipe.

The loss of head due to friction is

$$h = 4 f \cdot \frac{l}{d} \cdot \frac{v^2}{2g},$$

where l = length of pipe, in feet;
d = diameter of pipe, in feet;
v = velocity of water, in feet per second;
g = 32·2;
f = ·0075 (approx.)

The common velocity of water through large mains is about 3ft. per second.

The loss of head due to bends = $c \frac{v^2}{2g}$, c being a constant with following values: for elbow, c = 1; right-angle bend of radius = diameter of pipe = ·3; right-angle bend radius = 3 diameter of pipe = ·14. This loss is multiplied by number of bends to give total loss due to bends, which obviously should be few as possible.

The loss of head due to partial opening of sluice valve = $c \frac{v^2}{2g}$, c being a constant as below.

Fraction of diameter of pipe that the valve has been lifted	1	⅞	¾	⅝	½	⅜	¼	⅛
c	0	·07	·26	·81	2·06	5·52	17	98

Now, summing the loss of head due to bends, sluice valves, and friction, and inserting in (1), we obtain the diameter of pipe, d, required for given discharge, Q. The above formulæ are from "Fowler's Pocket-Book."—ERG.

Answer to No. 596 (*awarded* 5*s.*).—Work done by the pump will be the weight of water removed from well to tank, friction in the piping, and other losses. The weight of water lifted is a simple calculation. The loss due to friction in pipes varies *directly* as the square of the velocity of flow and length of pipe, and *inversely* as the internal diameter of the pipe. There is some difference in the formulæ given by authorities on this matter. The following are generally considered reliable—

Eytelwein: $W = 26{,}788 \sqrt{\frac{d^5 p}{L}}$;

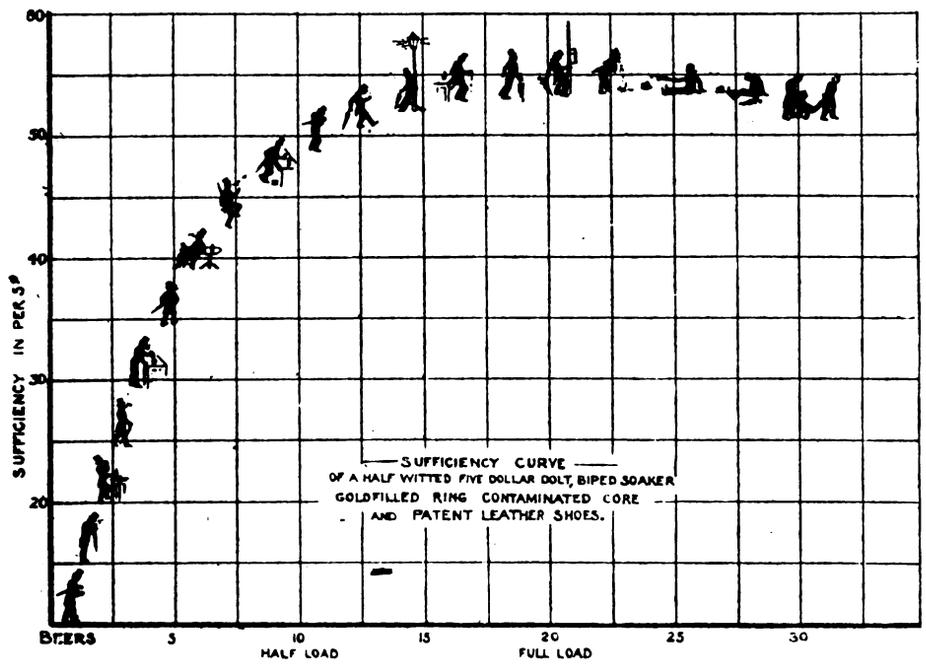
Hawksley: $W = 22{,}923 \sqrt{\frac{d^5 p}{L}}$;

where W = water, in pounds per hour;
p = loss of pressure (pounds per square inch;
d = internal diameter of pipe, in inches;
L = length of pipe, in feet.

It must be remembered that these formulæ represent the loss when pipes are smooth, straight, and free from incrustation. Where there is any danger to be apprehended from deposit, engineers allow an increase in the internal diameter of from 30 to 50 per cent. over the calculated sizes. Very elaborate formulæ have been given for losses due to curves and bends It is doubtful, however, if these formulæ are of much practical use, so much depending on the "sweetness" of the curves and general arrangement and workmanship A metropolitan report on water supply says: "The time necessary for the discharge of a given quantity of water through a straight pipe being 1, the time for an equal quantity through a curve of 90deg. would be 1·11; with a right angle 1·57, two right angles would increase the time to 2·464, and two curved junctions to only 1·23." We are all aware of the objections experienced workmen have to sharp "elbows." Roughness in the pipes, bad joints, rivet heads, etc., cause considerable increase in the frictional resistance, and must be allowed for. It is well to err on the side of having too large a pipe than one too small; cases are on record where the calculated losses due to friction in pipes have been considerably underestimated. A point to be noted is that the speed of plunger should not be greater than the rise of water below it; if it is, on the return stroke the plunger will meet water and cause knocking. The suction pipe should be of ample diameter, and the velocity of the rise of water in it not more than from 170ft. to 200ft. per minute.—M. M.

SATURATION CURVE.

We reproduce herewith from the columns of the *Canadian Engineer* an interesting skit on an efficiency curve of a ½-h.p. motor which was designed by Mr. Geo. Bickell, a young Canadian employed as chief draughtsman for a large electrical firm in the United States. The motor had a cast-steel ring, laminated cores, and cast-iron pole shoes. The figures on the curve clearly show when the field-magnet system approached saturation, and where.



The armature reaction overpowered any attempts to increase this saturation.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Bound Volumes of "THE ELECTRICAL ENGINEER," containing half-year's copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, July to December, 1902, now ready.

OPEN DISCUSSION.

The eighth annual convention of the Incorporated Municipal Electrical Engineers' Association came to a successful end on Saturday last. In spite of the attempt of the weather to drown the members, or at least to damp their ardour, the convention was a great success. This success is, in our opinion, largely due to the open discussions which followed the seven papers read at the meetings in Sunderland, Newcastle, and Middlesbrough. It was remarkable that the most heated discussions took place on those papers which dealt with policy, while those on engineering subjects did not attract so many speakers. As was to be expected, the controversy over the relative merits of municipal and company management was exceptionally keen. On this, as was only right, the chairmen of committees had much to say, but in spite of the commercial knowledge which these gentleman brought to bear on the subject, it was, in our opinion, the engineers who took the most businesslike view of the matter. Thus Mr. Robert Quin's remarks on the comparative figures for company and municipal management were much to the point. He said that the provincial corporations are supplying all the largest towns, and in consequence should be ashamed of themselves if they could not do better than the provincial electric light companies, who had to confine their attention to smaller places. As far as electric light undertakers are concerned, the controversy serves no useful purpose, but it has a considerable bearing on the future policy in the country as regards power distribution schemes. Those responsible for the organisation of the meeting had invited representatives of several of the large power companies to attend, and these gentlemen, who represent the largest company organisation in this country, freely gave their views. That at times these views were expressed rather strongly was only to be expected under the circumstances, although it is difficult to know whether they could be classed as "Daniels in the lions' den" or as "wolves in the fold." In any case, they were in the minority, and they boldly supported their own views. The question was, of course, as to whether corporations or power supply companies should both have the right to supply the large power consumers within borough boundaries. One representative of the power companies said that the North Metropolitan Electric Power Company had contracts in hand for supplying fifteen millions of units per annum at rates varying from 1d. to 1·4d. per unit. Another remarked that the Newcastle-on-Tyne Supply Company, in which is merged the power supply on the north bank of the Tyne, only received on the average 1·85d. per unit, while the County of Durham Power Company obtained only 1·43d. per unit. These figures are exceedingly creditable in view of the transmission of the energy over a considerable distance. The fact remains that without such transmission the Newcastle-on-Tyne Corporation is able to supply their own tramways with electrical energy at 0·88d. per unit, which figure includes all capital charges. Again, the Bradford Corporation have for years supplied all-day users of power at 1d. per unit; thus a manufacturer requiring a five horse-power motor in Bradford is in a better position than the average consumer of the above power companies. We believe it would also be right to say that he is as favourably situated as the largest consumer of these companies. The difference in the above costs of supply is largely due to the cost of the transmission system laid out with underground mains. As one speaker said, the crux of successful power distribution in this country is the use of high-tension overhead cables for the purpose. There seems to be some indication in Government quarters that

Digitized by Google

permission to use such cables may be granted by the Board of Trade in the near future. Unless some such means of reducing the annual capital charges for cables can be adopted, we are afraid in the future it will be found that the companies and corporations have been fighting as to who shall supply consumers who will not be content on either system. Large users of power having regular loads will find in many cases that it will pay them to put down their own generating plant. This fact was alluded to by an engineer in the discussion on Alderman Pearson's paper, and is one which cannot be disregarded by either side. To give an example, we need only quote from Mr. A. D. Williamson's able paper read before the Institution of Electrical Engineers in London last May. In this figures are given of four works with private plants in which the works cost vary from 0·469d. to 0·77d. per unit, and the total cost from 0·675d. up to 0·97d. per unit. The works which has the total cost of 0·675d. per unit use 2,610,620 units per annum, so that to take a supply from a company at 1d. would mean an annual increase in cost of £3,500. The order to supply these works, or others of a similar size, with electrical energy must therefore be difficult to obtain, and still more difficult to hold.

LOWESTOFT ELECTRIC TRAMWAYS.

FORMAL OPENING.

Under favourable conditions, the system of electric tramways constructed by the Lowestoft Corporation was formally inaugurated on Wednesday last. At 11.30 a.m. the guests of the Mayor (L. F. Orde, Esq.) and Corporation assembled at the car depôt, which adjoins the generating station, and were subsequently driven over the route. The Mayor, who, it may be mentioned, is also chairman of the Tramways Committee, himself drove the first of the gaily-decorated cars which formed the procession, attired in his robes and chain of office. As is usual upon such occasions, much enthusiasm was evinced by the crowds which lined the route. The line opened consists of a single track, with turn-outs, and the present length of route is approximately 5½ miles, the equivalent of some 6½ miles of single track being laid. Noteworthy in connection with the scheme is the fact that a commencement was not made with the construction of the line until March 11, 1903, the whole of the work, including overhead equipment, being practically complete by the end of June.

After a pleasant drive the party adjourned to the Grand Hotel, where they were entertained at lunch by the contractors and engineers. Speeches of the usual congratulatory and complimentary order followed, and the Corporation's consulting electrical engineer, Mr. W. C. C. Hawtayne, M.I.E.E., presented the Mayor, on behalf of the engineers and contractors, with a massive silver rose bowl as a memento of the occasion. Owing to the great pressure on our space we are unable to give Wednesday's proceedings in greater detail, but hope in a subsequent issue to fully describe the undertaking of which they were the immediate outcome. In doing this we shall be assisted by a very excellent descriptive souvenir, a copy of which was presented to each guest.

FORTHCOMING EVENTS.

Iron and Steel Institute.—Summer meeting, Barrow-in-Furness, September 1-4.

Municipal and County Engineers.—Meetings: Aberdeen, Aug. 20, 21, and 22; Hastings, September 11 and 12. Detailed programmes will be issued when definite arrangements are made.

London Electrical Contractors' Association.—Annual general meeting, July 27, 6 p.m., at Frascati's Restaurant, Oxford-street.

CHLORINE SMELTING, WITH ELECTROLYSIS.*

BY JAMES SWINBURNE, VICE-PRESIDENT.

(Concluded from page 116.)

CAPITAL COST.

As regards capital cost it is difficult to say how much the plant for any particular case will cost, as it depends on the ores to be smelted and local conditions. It is therefore wise to allow a large margin on all plant of a new description, and a large margin is left in the 30s. a ton for depreciation, repairs, etc. The electrical generating plant is a different matter, however. A large installation may be taken at an outside figure of £25 per kilowatt, including buildings and spares. In this case there is no accidental overloading, as in light and power distribution stations, so that £25 a kilowatt includes spares by overloading and separate plant. It will be evident that the cost of generating plant is a consideration in the capital expenditure. In the case of water power at 0·086 the capital expense is borne wholly by the owners of the power station. The power is there, and if it is not used for one purpose it is used for another, so that the water-power company really takes no special risks involved in a new process. The 0·086 thus covers the capital of the water station, and no water-power capital figures in the process accounts. A given amount of available capital thus gives much the best results on a water power. In the case of a gas plant the owners of the process may put up their own plant. The capital cost of gas generating plants may perhaps be safely taken as £25 a kilowatt, but it must be borne in mind that there is more uncertainty about it, and more chance of its becoming antiquated soon. Improvements in gas generators and engines are more rapid than in steam just now. In the case of steam generating plant the same considerations come in. If the owners of the process put down their own plant, they must allow for high profits on a share of it. Though 0·25 is given as the cost of steam-generated electrical energy, that is only if there is no risk. No business men would put down a generating plant specially to supply us with nothing but a guarantee of 0·25 per kilowatt-hour for a year or two. The nearest approach to such a case is a power station such as those being put up in various districts now. Even one of them would not contract for 0·25, as an output of some thousands of kilowatts day and night means adding special plant which, if thrown out suddenly by the financial failure of the process, would have to be idle till the demands of the station caught up with it, and even then the dynamos would have to be altered. In buying energy from a modern power station without contributing to the capital, the price would probably be about 0·3 per kilowatt-hour. If the process owns its own steam generating plant, it would be safe to allow for part of the cost being covered by 5 per cent. debentures.

The idea of risk-profits is this: Any new process such as this, however satisfactory the results so far, involves risks of failure. There are many chances of difficulties in working on a still larger scale, and chances of new and better processes coming out. The last chance is probably small, because the various problems of smelting copper, lead, zinc, antimony, tin, etc., have all been before the world for many years, and a new process that bids fair to solve all of them in a new way is not likely to be superseded, as regards many of them, by something else, though it might be as regards one of them. The only real risk is that of all new processes—unforeseen difficulties or expenses. The present process is too far advanced to leave many loopholes, but even then experience of other industries shows that it is not wise to embark in a new scheme unless, after the most searching criticism, the profits on paper are so large as to leave a very wide margin. But to get a fair idea, it is obvious that capital in steam generating plant, or in sites, must not all be counted in as expecting what are here called risk-profits. One kilowatt at four volts per cell deposits 2·61 tons of zinc a year at a current efficiency of 1. The departure from this current efficiency is minute, but the pressure will probably be reduced considerably with larger vats. Steam plant for a ton of zinc a year thus costs £9. 12s., or, roughly, £10 in capital. To reduce a ton of lead a year by replacement with zinc thus involves a capital of £3, and a ton of copper (cuprous) £5 approximately. In metallurgy it is usual, and some people find it convenient, to work in "units." For each ton of ore smelted per year the capital cost of steam plant thus comes out: zinc £0·1 per unit, copper £0·05, lead £0·03 approximately, so that if an ore has 33 units of lead, 20 of zinc, and 10 of copper, and plant is wanted to smelt 100,000 tons a year, the steam plant would cost £350,000.

As to smelting plant, including vats, transformers, agitators, pumps, boiling-down plant, and buildings for all the works other than the generating plant, it may be wise to allow as much as half the steam plant for cost of process, plant, etc., and another equal sum for working capital. To begin with, we may work out a rough estimate for treating bluestone ore in this

* Paper read before the Faraday Society.

Digitized by Google

country with steam generating plant put up for the purpose. One hundred thousand tons of ore a year will be taken, the ore containing as delivered 22 per cent. zinc., 18 per cent. lead, iron 4 per cent., manganese 3 per cent., gangue 35 per cent., sulphur 18 per cent., silver 15oz. The process would require a capital of, roughly, £550,000, including the generating plant, with no debentures. This allows nothing for payment of patent rights. The costs of working would be :

By 100,000 tons of slimes delivered at £2. 10s.	£250,000
By 100,000 tons of ore carried through process, excluding cost of energy	150,000
By electrical energy	94,200
By allowance for loss of metals and chlorine, say	15,000
By cost of realising products	16,000
	£525,200
Profits	£341,200
To sales of zinc at £20, lead at £12, silver at 2s., two-thirds of the sulphur at £3, iron oxide at £2, manganese £5. 5s.	£866,400

This leaves over 60 per cent. profit on capital, a profit which would leave a margin even after paying the royalties wished for by the proprietors of the patents. Suppose, however, energy were bought at no less than 0·4d. per kilowatt-hour from a power supply station. The costs would be increased by £55,800 per annum. But the capital would be reduced to, say, £275,000, making a profit of £285,000 on £275,000, or over 100 per cent.

Another estimate may be taken for different conditions. In this case a water-power works on the waterway from the American lakes to the sea will be considered, dealing with ore from the district above. Take the ore as zinc 41, lead 15, and silver 2oz. This is a real ore, but I have no data as to iron contents. If there is any iron to speak of, there must be little gangue. Also I do not know the value of this ore, but will assume it to be refractory. It will then give a good miner's profit if the ore is taken at £2 a ton delivered on the works. To smelt 100,000 tons a year of such a rich ore as this would need about £500,000, of which half is process plant and half working capital. Electrical energy would be bought at, say, 0·1d. per kilowatt-hour. One hundred thousand tons Canadian ore smelted in America by water power :

By 100,000 tons ore	£200,000
By process expenses	150,000
By electrical energy	73,500
By losses, commission, etc.	30,000
	£453,500
Profits	£566,500
To sales of metals	£1,020,000

There is thus well over 100 per cent. profit on this scheme—of course before paying royalties. This ore has very little gangue, and in that case it might be worth while to dilute it with poor copper ore, especially if the copper ore contains some other valuable metals, such as zinc, antimony, nickel, or precious metal. Thus if the ore has only 10 per cent. of gangue, and a low-grade copper with 3 per cent. of copper, 5 per cent. of zinc, and 5 per cent. of iron, has some 80 per cent. of rock ; for every ton of the rich ore more than a ton of this poor ore could be run through too. The works would then deal with 100,000 tons of this poor ore with very little extra capital cost or expense, as it is nearly all rock, which is eliminated near the beginning of the process. A little more than £1. 10s. a ton for the process should have been allowed for the rich ore, and a poor ore takes a great deal less. Discussing the different metals in order :

Antimony.—This metal is very easily extracted from the sulphide, either as brown sulphide or as oxide, preferably as oxide. It can also be got out as regulus by reduction. It does not matter whether the antimony is mixed up with other metals or alone.

Arsenic.—This is almost on all fours with antimony. Like it, its sulphide is very easily converted into chloride. It can be equally easily treated when it is an arsenide of other metals. The chief difficulty of antimony and arsenic arises from the poisonousness of their volatile chlorides. We have done little with arsenic.

Bismuth.—This is a small question. Bismuth would be easy to deal with, as it falls out of solution as oxychloride.

Cobalt.—This comes out as oxide ; if nickel is also present, the nickel and cobalt and iron, and perhaps manganese have to be separated in the wet way. There is nothing special about the problem.

Copper.—This comes out of the transformer as cuprous chloride, which is soluble in the other chlorides. It is deposited as cement copper by zinc, not iron. The process will handle ordinary high-grade copper ores successfully, as any other metal, except iron or manganese, is extracted separately as metal too. The copper is, of course, free from sulphur, arsenic, iron, antimony, phosphorus, silver, etc. In fact, it is pure. Copper can be equally cheaply extracted from arsenical or antimonial ores ; in fact, the ores may have arsenic, antimony, zinc, lead, iron, nickel, gold, silver, cobalt, or anything else, and they are all separately extracted without appreciable extra cost. Poor copper ores will either be concentrated, or run in with other richer stuff.

Gold.—When present in copper, lead, or other such ores the gold comes out with the silver. Gold in conjunction with antimony, arsenic, tellurium, and small quantities (per ton) of common metals can be treated as a low grade ore, and run in with any rich mixed or other sulphide, such as lead, zinc, or even rich copper ore or matt. It is largely a question of carriage, and what ores are near each other and near the works.

Iron.—This metal occurs in zinc and copper ores, and comes out as oxide. This oxide is reckoned at £2 a ton, and is useful as a paint. The value depends on the tint, and this depends on the way it is worked up—a matter we have not yet studied. Good oxide fetches high prices, up to £15 or £20 a ton, but the sale is probably very limited. Assuming the lowest price, £2 is not too much to count upon for paint for preserving iron structures where colour is not an object. The extraction of iron itself is a different question. It would come down as a powder from the fused chloride, and would have to be fused together. It would probably cost something under £10 a ton. It may prove that chemically pure iron, with no trace of phosphorus, sulphur, silicon, or manganese, or other impurity, is well worth £10 a ton for making special steels or electrical iron stampings.

Manganese.—This metal, like iron, is a drawback in an ore, as it comes out of dioxide, which is not valuable, though the sale of the manganese from such an ore as Broken Hill slimes is worth considering.

Nickel.—This is much the same as cobalt as far as the process goes. It comes out of the transformer as nickel chloride.

Silver.—The silver comes out separately—that is to say, it is extracted from a lead ore as a rich lead-silver alloy. From copper ores it is precipitated by cement copper from the solution of the chloride. Or it may be thrown down by the Claudet method.

Tin.—Tin ores can be added to the charge of the transformer, or treated alone. There is nothing peculiar about it.

Zinc.—Has been fully discussed. Zinc need not exist in the ore worked.

As it is not possible to give a series of estimates for all the innumerable complex ores, it may be well to give an approximate rule which can be applied to any ore.

Rule for Capital.

For each ton of ore per annum to be treated allow :

Zinc	£0·1	per unit.
Copper	0·05	,,
Lead	0·03	,,

and for other metals which are extracted in the metallic state, in proportion, inversely as their equivalents. Metals like iron and manganese or antimony, which are extracted as oxides, do not count. This gives a very rough idea of capital necessary for process plant and working capital. If steam or gas generating plant is to be put down, double this capital.

Rule for Working Costs.

For each ton of ore treated at works allow cost of ore delivered, plus £1. 10s. per ton for treatment, including everything but cost of electrical energy, and allow 5 per cent. extra on cost of ore to cover all waste. The cost of energy depends on the metal content and on the cost of generation. Steam may be taken at 0·25d., gas at 0·125d., and water at 0·1d. per kilowatt-hour.

Cost per unit of	Steam power. £	Pence	Gas power. £	Pence	Water power. £	Pence
Antimony (if as metal).	0·042	10	0·021	5	0·016	4
Copper	0·0175	4·2	0·009	2·1	0·007	1·7
Iron (as oxide)	—		—		—	
Manganese (as oxide)	—		—		—	
Lead (desilverised)	0·0107	2·6	0·0054	1·3	0·0043	1
Nickel	0·038	9	0·019	4·5	0·015	3·6
Silver and gold	Inappreciable		—		—	
Tin	0·038	9	0·019	4·5	0·015	3·6
Zinc	0·0342	8·2	0·017	4·2	0·0136	3·3

The price in pence is added because it gives cents, too, by doubling. To find the value of the products, add up all the metals in full, the waste or loss being amply covered by the 5 per cent. The iron and manganese must be omitted, being oxides. Their market is uncertain, and much must not be allowed for them. Some of the sulphur is burnt ; it is safe to allow for two-thirds of the sulphur contents of the ore at market price.

The process is thus anything but expensive. To see how this is the case comparison must be made with other plants. Take a mixed zinc, lead, and copper ore for example. If we take the corresponding plant on the present system, we have first a concentration plant ; next a lead-smelting works with all

Digitized by Google

its adjuncts, including a desilverisation plant; a zinc works and refinery; and a copper-smelting works with an electrolytic refinery. There can be no comparison as to capital cost. As to working cost, the new process begins by saving the concentration, except for very low-grade ores, or where carriage comes in, and thus saves waste. Though 5 per cent. waste has been allowed, there is practically no waste of metals; there is nothing to correspond with the waste of copper, zinc, and lead in smelting. In addition, iron and manganese oxides are got out, and most of the sulphur is obtained as brimstone. In this process a smelting works is independent of ore supply, in the sense that it can work any ores. If copper ores go up, it can devote its whole energy to zinc and lead, and so on, and the variety of ores is so great that the process cannot enhance the value of the ores to the miners. The supply of ores is thus practically unlimited.

This process is the joint invention of Mr. E. A. Ashcroft and myself. Mr. Ashcroft came on the scene when the process was in the baby or test-tube and patent stage. He took it up from that point, and has developed it, not without the necessary pecuniary food being provided for it, into a healthy, full-sized process which appears to have the backbone of a giant. Since he joined we have worked together as co-inventors, and he has designed and worked out all the plant and carried out all the works. Mr. Ashcroft has also read a paper on this process before the Institution of Mining and Metallurgy; but the process is so little known that it seemed advisable to offer a paper to the Faraday Society.

I hope no one will object to the introduction of questions of cost. This paper is largely financial. All engineering—electrical, chemical, or otherwise—is purely a question of cost. There may be people who think that science is not science unless it is merely useless information. Science really is not science unless it is or seems likely to be of use. Every step of the inception and development of a process like this involves science, and practically nothing but science. I have also dwelt rather on the broad questions of the scope of its application than on details, because Mr. Ashcroft's paper goes into details very fully, and should be read with this. I am anxious also that the discussion should not turn on detail difficulties that speakers think we ought to meet, or the impossibility of getting off sulphur by replacement with chlorine, or of electrolysing zinc chloride on the large scale; because we have transformed and electrolysed on the large scale with perfect success. I am much more anxious to know the society's opinions on the probable future of such a process as this, and its application to the various ores found in different localities.

My thanks are due to the Metallurgical Trust, Limited, the proprietors of this process, for leave to offer this paper to the Faraday Society.

TRADE NOTICES AND NOVELTIES.

Ships' Light Indicator.

We have received from Messrs. William McGeoch and Co., Limited, 108, Argyle-street, Glasgow, a circular describing their duplex ships' light indicator. The chief feature of this indicator is that it not only gives warning when a lamp is extinguished, but also indicates when one filament of a twin-filament lamp has burnt out. On the front of the containing case there is arranged a series of "windows" representing the various signal lamps of the ship, and, in addition, a small green window is fitted at the top of the case to show when the "pilot" lamp, which is used to illuminate the windows, is alight. When all the signal lamps are burning properly, the windows representing signal lamps are screened by shutters, and no light appears except from the small pilot window. Should one filament of a lamp burn out, the window representing that lamp half uncovers and shows a half-red light. Should a lamp go totally out, the corresponding window shows an all-red light, and a bell in connection with the indicator commences to ring, and continues doing so until switched off by the switch controlling the faulty lamp.

The Siemens "Liliput" Arc Lamp, etc.

From the Siemens Electric Appliances, Limited, 61 and 62, Watling-street, London, E.C., we have received a number of sheets on which various telephone instruments, etc., are illustrated and described. One of these sheets deals with the firm's "Liliput" arc lamp. This lamp is of the continuous-current type. Its mechanism is simple: for the regulating of the carbons it contains in place of a clockwork a movable clamping arrangement, which is not disturbed by vibration or even a hard knock. The lamp burns singly at 100-120 volts, or two in series at 200-300 volts, and gives without a globe a hemispherical light of 160 c.p., whereas with an alabaster globe it gives a light of 130 c.p. The energy expended is equivalent to 1 to 1·2 watts per candle-power. It is claimed that this lamp is most suitable for indoor use as a dining-room, drawing-room, or even as a table lamp. Its outer dimensions are very small. The cylindrical cover has a diameter of 2½in., and the globe of 3¼in. The length is 12¼in. For the indoor use of these lamps special fittings and shades have been designed. These are illustrated on another of the sheets sent to us.

Nernst Lamps.

We give below the results of a second series of life tests of Nernst lamps made by Mr. Hoadley, the borough electrical engineer of Maidstone. It will be noticed that the average life of the lamps tested was considerably over 1,000 hours, a far better result than obtained for previous tests. The illumination tests made in the streets with a Trotter illumination photometer are also interesting. We are indebted to the Electrical Company, Limited, 122 and 124, Charing Cross-road, who supplied the lamps, for the accompanying figures:

Catalogues and Pamphlets Received.

W. F. Dixon and Co., 60 and 63, Percival-street, Chorlton-on-Medlock, Manchester: Messrs. Dixon and Co. make a speciality of the manufacture of metal-bushed, screw-bound, and steel-shrouded buffalo raw-hide silent gears. We are informed that in several instances their pinions have been running 140 hours per week at 800 and 900 revolutions, developing 40 b.h.p. and upwards, for more than four years, and are still running well. Others have been running upwards of five years on reversing motors in the most trying situations with no sign of requiring renewals.

PERSONAL.

Mr. J. Baillie Hamilton, general manager of the Leeds tramways, who had been offered £1,500 a year by the Tramways Committee of the Birmingham Corporation for the performance of duties similar to those he now fulfils for £900 a year, has decided to remain in Leeds on the understanding that his salary be advanced to £1,200 with an annual increase of £100 until £1,500 be reached.

The Portsmouth Corporation have decided to advance the salaries of Mr. C. M. Gardner, manager, and Mr. T. Holme, assistant manager of the telephone department, to £250 and £135 per annum respectively.

Mr. J. F. Shoolbred, chief assistant at the Corporation electricity works at Stockport, has been appointed clerk of works for the Newcastle Corporation electricity department at a salary of £150 a year. There were over 100 applications.

Mr. J. Gray Scott, the borough electrical engineer of Croydon, has been presented with a handsome marble time-piece by the Lighting and Electricity Committee on the occasion of his approaching marriage.

LONDON TRAFFIC COMMISSION.

The Royal Commission which is enquiring into the question of the traffic of London had another sitting on Friday at the Westminster Palace Hotel, Sir David Barbour presiding.

Mr. Maurice Fitzmaurice, chief engineer of the London County Council, was the witness. In reply to questions, he said that the Council, when making new streets, constructed subways for water and gas mains, electric light, and other cables. There were 14 subways, with an aggregate length of 5¼ miles, which contained gas-pipes, water-mains, telephone cables, electric lighting cables, District Messenger wires, and Hydraulic Power Company's mains. A subway 12ft. by 8ft. would cost about £18 per yard run for construction, but this price might easily be trebled. The Council under the Subways Act, 1893, had made by-laws by which it could compel all companies laying new pipes in a street where there was a subway to lay them in that subway. In reply to further questions, the witness said that before 1889, with the exception of the East London Railway and the row-boat ferries, there was no crossing of the river to the east of London Bridge. The Rotherhithe Tunnel was to cross the river from Wapping to Rotherhithe. The cost would probably be about £2,000,000. Vauxhall Bridge was being reconstructed, and would be finished in about two years. It was to be built so as to be suitable for a tramway. A new bridge between Waterloo and Blackfriars Bridges was urgent.

The **Chairman:** You have certain proposals before you with reference to north and south connections?

The **Witness:** Yes. Among them there is one from the Crystal Palace district to Waterloo-road, near Waterloo Station, and then continued across the river by a new high-level bridge between Waterloo and Blackfriars Bridges. One branch of the new street might then fall to meet the eastern crescent of the new Holborn to Strand street, and another branch might continue north by a bridge over Fleet-street between Chancery-lane and Fetter-lane, from which point it might be continued to the county boundary. Three types of streets have been taken for the new road from the Strand to the county boundary near the Crystal Palace. Type A is a street 150ft. wide, footpaths 20ft.; the central portion of the street, 30ft. wide, is reserved for motor and other quick traffic, and on each side of the central part is a width of street of 40ft. for surface tramways and slow traffic. Underneath is a subway for single-deck tramcars, and there are the usual pipe subways and sewers. Type B shows a street 100ft. wide, with two footpaths each 14ft. wide, and a roadway of 72ft. Underneath is a double subway. Type C is the same as type A with regard to surface, but the tramcars are carried in two tubes at a deep level. The cost of the above roads, including 150ft. of land on each side, is estimated at: Type A.—Works, £4,000,000; property, £12,000,000—total, £16,000,000; cost per mile, £2,560,000. Type B. — Works, £4,550,000; property, £10,500,000 — total, £15,050,000; cost per mile, £2,400,800. Type C. — Works, £5,125,000; property, £12,000,000—total, £17,125,000; cost per mile, £2,740,000. The figures given are the gross estimates, making no allowance for recoupment. Continuing, the witness said there was no engineering difficulty in constructing a shallow subway under the Strand, or even under Piccadilly. The principal reason why deep-level tubes had been adopted in London was the presence of London clay over the greater portion of the area. The want of consent of various borough councils had made it impossible for the County Council to obtain powers to construct all the tramways which they thought necessary. The remarkable system of shallow subways for railways now being constructed in New York would, when completed, give facilities for traffic which would be ahead of anything contemplated for London. In many cases four lines were proposed in the subways—two for express trains and two for slow trains—and that was no doubt the ideal system. The largest system of shallow subways in the world was that of the Metropolitan and District Railways of London. When electrified they should compare favourably with any others.

The Commission adjourned.

SWANSEA ELECTRICITY ACCOUNTS.

The accounts of the Swansea electricity undertaking for the year ended March last show that the gross profit amounted to £4,578. 14s. 3d. Allowing £2,418. 17s. 6d. for interest the net profit on the year's work comes out at £2,159. 16s. 9d., less debit balance 1902 £349. 9s. 10d., leaving £1,810. 6s. 11d. to be carried forward to next year. The following are the principal items in the accounts, the first set of figures in every case being for the year 1901-2 and the second the year 1902-3; amount sanctioned, £52,046—£205,231; amount borrowed, £52,046—£89,595. 19s.; capital expenditure, £60,230. 15s. 9d.—£89,595. 19s.; revenue from supply, £4,571. 12s. 3d.—£8,249. 8s. 11d.; motor rents, nil—£50. 19s. 4d.; total revenue, £4,571. 12s. 3d.—£8,300. 8s. 3d.; total costs, £2,308. 8s. 2d.—£3,721. 14s.; gross profit, £2,263. 4s. 1d.—£4,578. 14s. 3d.; percentage of gross profit to capital, 3·75 per cent.—5·11 per cent.; interest on loans, £2,612. 13s. 11d.—£2,768. 7s. 4d.; percentage of interest and sinking fund to capital, 4·33 per cent.—3·09 per cent.; financial result—after payment of all charges (including interest) on year's working, and including the £349. 9s. 10d. deficiency last year, but excluding sinking fund—profit, £292. 14s. 11d.—£1,810. 6s. 11d.; capacity of dynamos at end of year, 525 kw.—1,725 kw.; maximum load reached, 423 kw.—547 kw.; load factor, 8·61—12·06; number of equivalent 8-c.p. lamps connected at end of year, 23,166—42,112; total units sold, 319,215—578,182; units sold per 8-c.p. lamp, 13·77—13·73; price charged—private lighting, 6d. and 2d.—6d. and 2d.; power, 2d. and 1½d.—2d. and 1½d.; average price obtained—private, 3·54d.—3·41d.; ditto, public lighting, 3·14d.—2·71d. The following are the principal items of generation and distribution costs: year 1901-2—coal, £697. 3s.—1902-3, £1,224. 4s. 7d.; water, oil, and engine-room stores, £135. 11s.—£231. 8s. 1d.; wages on generation, £481. 7s. 10d.—£865. 12s. 5d.; wages, etc., on repairs and maintenance of buildings, plant, etc., £18. 0s. 6d.—£125. 10s. 6d.; wages, etc., on public lamps, £40. 14s. 2d.—£224. 18s. 11d.; works costs, £1,372. 16s. 6d.—£2,671. 14s. 6d.; rents, rates, and taxes, £307. 11s. 10d.—£322. 14s. 5d.; management expenses, etc., £627. 19s. 10d.—£655. 3s. 4d.; total costs, £2,308. 8s. 2d., or 1·72d. per unit sold—£3,649. 12s. 3d., or 1·48d.

STAFFORD ELECTRICITY ACCOUNTS.

Appended is an abstract of the accounts of the Stafford electricity undertaking for the year ended March 31 last, the capital expenditure on which date amounted to £30,000.

HACKNEY ELECTRICITY AND REFUSE DESTRUCTOR UNDERTAKINGS.

The joint report of the borough accountant and borough electrical engineer of Hackney for the year ended March 31 last, together with the accounts for that period, which have been jointly prepared in the electricity and finance departments, has reached us. These accounts form the records of the first complete year of working of the electricity and destructor undertakings. With regard to the electricity department, the report states that the progress made during the period under review is remarkable and entirely satisfactory. At the close of the accounts there were the equivalent of 68,897 lamps of 8 c.p. connected to the mains, including 98 motors with an aggregate of

Digitized by Google

380½ h.p. 1,943,983 units were generated. Of this total, 539,006 units were sold to the Works and General Purposes Committee for public lighting, realising 2·70d. per unit, out of which 0·40d. per unit was spent in carbons, trimming, maintenance, and attendance on the lamps and columns. 1,075,962 units were sold to private consumers for lighting and power, realising 3·36d. per unit. 132,558 units were used on the works for lighting and driving the auxiliary machinery; 51,736 units represent the energy used by the battery, and 144,721 units the distribution losses. The cost of working—viz., 1·03d. per unit sold—is extremely low, especially when it is remembered that at present the day load is small and the load factor only reaches 15·88 per cent. The analysis of costs is set forth below:

	Total costs.	Cost per unit sold.
Coal and other fuel	£3,199 9 4	0·48d.
Oil, waste, water, and stores	217 3 8	0·03d.
Wages of workmen	1,303 16 8	0·19d.
Repairs and maintenance	607 16 2	0·09d.
Works costs	5,328 5 10	0·79d.
Rents, rates and taxes, and management expenses	1,604 2 4	0·24d.
Total costs of generation and distribution	£6,932 8 2	1·03d.

The cost of carbons, trimming, attendance, and lighting the public lamps amounted to £902. 9s. 1d., or 0·40d. per unit sold for public lighting. The report claims that these costs hold the record for the Metropolis. The total revenue was £21,367. 14s. 7d., while the total working expenses amounted to £7,834. 17s. 3d., leaving a gross profit of £13,532. 17s. 4d. The interest on borrowed money accrued to March 31 was £9,090. 16s. 5d. The instalments repaid on borrowed money to the same date was £2,609. 7s. 3d., while £421. 4s. 4d. interest was received on money on deposit, so that a net surplus of £2,253. 18s. remains. The writers of the report have not thought it necessary to depreciate the cost of the works and plant, inasmuch as the full cost of maintenance and renewals has been charged to revenue account. In accordance with the recommendation of the Finance Committee adopted by the Borough Council on March 5, 1903—viz., "That whatever profits accrue during the present financial year and also the next, that they be placed to the credit of a reserve fund and invested as required by the electric lighting order"—it will be observed that the net surplus of £2,253. 18s. has been so transferred. All the plant that has been taken over from the contractors has been efficiently maintained, and the works generally are in a satisfactory condition.

Reporting on the destructor department, the writers state that the destructor was put into operation on April 21, and during the 11 months it has been in use it has cremated 34,006 tons of refuse. The largest quantity cremated in any one day was 186 tons, and the smallest quantity 41 tons, the average daily quantity burnt being 120 tons. The average quantity of water evaporated per pound of refuse was ·54lb. As the demand for electricity throughout the daytime does not require the full amount of heat generated by the destructor, the surplus heat has to be by-passed direct to the chimney during the light-load period, but with the increasing day demand for electricity the destructor heat is gradually being utilised to greater advantage. From the 34,006 tons of refuse 120 tons of tins and scrap iron were removed, and 11,578 tons of clinker, fine ash, and flue dust were carted away. The following is an analysis of the destructor costs:

		Cost per ton of refuse.
Oil, waste, water, and stores	£60 11 5	·43d.
Electricity	660 9 11	4·66d.
Wages of workmen	2,708 0 2	19·11d.
Repairs and maintenance	47 17 5	·34d.
Clinker disposal	746 16 4	5·27d.
Works costs	4,223 15 3	29·81d.
Management expenses	304 4 1	2·15d.
Total costs	£4,527 19 4	31·96d.

In addition to the foregoing amounts, the interest and repayment charges amounted to £2,771. 13s. 1d. The net cost of the destruction of the borough refuse, after crediting the destructor with the heat utilised by the electricity department to the value of £2,272. 4s. 8d., and with £7. 16s. 1d. of sundry receipts, was £5,019. 11s. 8d., or practically 2s. 11½d. per ton. The accounts show that the capital expenditure on March 31 last was £233,100.

APPOINTMENTS VACANT.

Engineer-in-Charge, Electricity Department, Borough of Bermondsey, £104 per annum, July 31. Advertisement in last issue.

Assistant Superintendent, Indian Telegraph Department, Rs.4,200 a year. Apply, Secretary, Judicial and Public Department, India Office, Whitehall, London, S.W., Aug. 1. Advertisement in last issue.

Two Skilled Cable Jointers, Durban Municipality, 15s. a day. Applications, by letter, to be sent to Z.X.Y.Z., care of Deacon's Advertising Offices, Leadenhall-street, London, E.C., by July 27.

Chief Assistant Electrical Engineer, Hoylake and West Kirby Urban District Council, £126 per annum, July 28. See advertisement.

Electric Wiring Clerk of Works, Parish of St. Pancras, £3 per week. See advertisement.

Estimating Engineer for large electrical works in the Midlands. See advertisement.

Electrician (working) for collieries near Durham. See advertisement.

Representative.—Firm of manufacturers require energetic representative for developing sale of new type of transformers. See advertisement.

Switchboard Attendant, Corporation of Swindon, 27s. 6d. per week, Aug. 3. See advertisement.

LEGAL INTELLIGENCE.

THE READING OF METERS.

At the Brompton County Court, on Monday, the Brompton and Kensington Electric Supply Company applied for an injunction to enable them, by their inspectors, to enter the premises of Mrs. Shadforth, 143, Gloucester-road, Kensington, W., for the purpose of reading the company's meter.

Plaintiff's solicitor explained that the Electric Lighting Acts provided that any officer appointed by the undertakers might, at all reasonable times, enter any premises to which electricity was, or had been, supplied by the undertakers, in order to inspect the meter, etc. There was a contract dated Nov. 4, 1901, between the plaintiff company and Mrs. Shadforth for the supply of electricity to her house—she being the lessee—but on various occasions when the inspectors called to read the meters, they were refused admission because they had not made an appointment.

One of the company's inspectors bore out solicitor's statement regarding the refusal on various occasions to allow witness to read the meter at defendant's house.

Counsel for the defendant explained that Mrs. Shadforth was away from London, and had absolutely nothing to do with the matter.

His Honour said that before he could grant the injunction he would have to be satisfied that the lady had acted, under the circumstances, unreasonably. He came to the conclusion that she had done nothing to justify the granting of the injunction. There would be judgment for the defendants, with costs.

WEST RIDING TRAMWAYS.

The Court of Appeal, consisting of the Master of the Rolls and Lord Justice Cozens Hardy, on Saturday heard the case of Dixon *v.* the Ito Syndicate, Limited, on the defendants' appeal from an order of Mr. Justice Walton in Chambers.

Mr. Rufus Isaacs, K.C., for the appellants, said the plaintiff, Mr. Dixon, claimed £7,401 under an engineer's certificate for work done under a contract, and damages for wrongful determination of an agreement by the defendants, who had purchased from the West Riding Tramways and Electricity Company certain rights to construct tramways, etc. The Master, as a condition to defend the claim, ordered the defendants to bring the £7,401 into court. The Judge in Chambers varied that order by directing that £6,660 should be brought in, and gave leave to defend the action as to the balance and as to the claim for damages. The present appeal was for unconditional leave to defend.

At the close of the arguments, the **Master of the Rolls** gave judgment. He said the case must go for trial in the ordinary way, the defendant having unconditional leave to defend.

RECORDING TELEGRAPH.

On Monday, in the Chancery Division, Mr. Justice Buckley heard the case of Prankerd *v.* Lee, which was an action brought by Mr. Archibald Arthur Prankerd, a retired barrister, against Mr. Sydney Lee for the return of £500 which plaintiff invested in the Recording Telegraph Corporation, Limited, on the ground, as plaintiff alleged, that it was obtained from him by fraud and misrepresentation of the defendant, the promoter. After a consultation between counsel, Mr. Terrell announced that his lordship would be saved any further trouble. They had agreed that the action should be dismissed, the defendant to pay back the £500 and take back from the plaintiff the securities he had given him. The action was dismissed by consent with costs.

"TUBE" CONSTRUCTION.

On Wednesday, in the Chancery Division, Mr. Justice Kekewich gave judgment in the action of Ash *v.* the Great Northern, Piccadilly, and Brompton Railway Company, brought by Mr. William Ash and Colonel Du Vernet for an injunction and damages, they complaining that the defendants, by their contractors, workmen, servants, and agents, in the course of the construction of their tunnel at the Sloane-street Station site conducted their operations with excessive noise so as to cause a nuisance and interfere with the comfort of the tenancy of the plaintiffs' residences. The defendants pleaded their statutory powers, and asserted that the work was done with caution and judgment, and without negligence.

Mr. Justice Kekewich held that the defendants had acted reasonably and in the exercise of their statutory powers from Nov. 18, 1902, when their Act received the Royal assent, and he gave judgment in their favour, without costs. He awarded Mr. Ash £20 in respect of damage prior to 1902.

COMPANIES' MEETINGS AND REPORTS.

EASTERN TELEGRAPH.

The directors, in their report for the six months ending March 31 last, state that the revenue for the period amounted to £626,750, from which are deducted £162,847 for the ordinary expenses and £27,472 for expenditure relating to repairs and renewals of cables, etc., during the half-year. After providing £7,206 for depreciation of spare cable, £110 for sundry differences in exchange, and £11,365 for income tax, there remains a balance of £417,748, to which is added £22,383 brought from the preceding half-year, making a total available balance of £440,131. From this balance there has been paid interest on mortgage debenture stock, dividends on preference stock, and an interim dividend of 1½ per cent. on the ordinary stock, leaving a balance of £320,031, out of which the directors have placed £5,000 to the reserve fund for maintenance ships and £180 to the general reserve fund. The directors now recommend the declaration of a final dividend on the ordinary stock for the year ended March 31, 1903, of 1½ per cent. and a bonus of 2 per cent., amounting together to £130,000, both payable on the 30th inst., free of income tax, and making, with the three previous payments on account, a total distribution of 7 per cent. for the year. The balance of £5,031 is proposed to be carried forward.

DIRECT UNITED STATES CABLE.

The report of the directors for the six months ended June 30 last states that the half-year's revenue, after deducting payments, amounted to £48,886, as compared with £46,610 for the corresponding period of 1902, showing an increase of £2,276. Working and other expenses for the same period, including income tax, amounted to £21,724, leaving a net profit of £27,162, making, with £4,779 brought forward from the previous half-year, a total of £31,942. For the corresponding period of 1902 the working expenses and other payments amounted to £21,515. Three quarterly interim dividends of 3s. each per share, amounting to £27,319, have been declared and paid during the year, and a final dividend of 3s. per share is now proposed, together with a bonus of 1s. per share, making, with the three interim dividends, 3¼ per cent. for the year, being a total distribution of £39,461. After transferring £8,000 to reserve fund, there remains a balance of £2 693 to be carried forward. The reserve fund account has been debited with £22,931 for cost of cable repairs, and after being credited with interest on investments, profit on sale of securities, and amount transferred from revenue, the balance now amounts to £474,664, taking the investments at cost price.

EDMUNDSONS' ELECTRICITY.

The report of the directors for the year ended March 31 last states that, including the sum of £6,179 brought forward from last year, the net profit, after payment of debenture interest, amounts to £53,048. After deducting dividends on preference shares paid and accrued, amounting to £9,540, and an interim dividend at the rate of 5 per cent. per annum on the ordinary shares, there remains a balance of £37,257. The directors recommend a final dividend on the ordinary shares at the rate of 9 per cent. per annum, making 7 per cent. for the year, to be written off goodwill account £5,000, and added to reserve fund £9,274, leaving to be carried forward £11,733. During the year 20,000 preference shares and £40,000 debenture stock have been issued. The premiums received in respect of these issues, less expenses, amount to £16,725, and have been added to the reserve fund, which, with the contribution proposed to be made from revenue account, will be increased to £40,000. The 4,500 deferred shares have

Digitized by Google

been converted into ordinary shares, in accordance with the articles of association.

DUBLIN UNITED TRAMWAYS.

The report of the directors for the half-year ended June 30 last states that the amount available for division is £36,882. 16s. 8d., out of which dividends for the half-year are recommended at the rate of 6 per cent. per annum on the preference shares and at the rate of 5 per cent. per annum (free of income tax) on the ordinary shares, and a sum of £2,000 has been set aside to reserve fund. These dividends, with the sum set aside, will absorb £34,025, leaving £2,857. 16s. 8d. to be carried forward. The amount charged against revenue of the half-year for rates and taxes again shows an increase of £2,125 as compared with the corresponding period of 1902.

AUCKLAND ELECTRIC TRAMWAYS.

At the ordinary general meeting of this Company **Mr. C. Shirreff Hilton** (the chairman) intimated that work on the electric lines, which was commenced in August 1901, was now almost finished. There remained still unfinished the overhead work for about two miles in the Onehunga district. Since May 23 about 14¾ route miles had been in operation, and from the latest figures there was every reason to congratulate the shareholders on the result of electric traction to date. Since the opening of the lines the traffic receipts had certainly been up to expectations, and every mail that came in gave reason to have confidence in the future.

The report was adopted.

CHILI TELEPHONE.

The general meeting of the shareholders in this Company was held on the 16th inst. at Winchester House, E.C., Mr. George Keith presiding.

The **Chairman**, in moving the adoption of the report (which appeared in our issue of the 10th inst.), said that the Company had made steady progress. The gross revenue had increased, and the higher rate of exchange had also contributed to the profits. The business was very satisfactory, and the payment of a 6 per cent. dividend realised the expectations of the Company at its start. The financial position of Chili had improved and business prospects generally were better. The Chilian people appreciated telephone communication, and business had extended. The service had been well maintained, and he looked forward to continued prosperity for the Company.

The report was adopted.

NEW COMPANIES REGISTERED.

Reliance Electric Company, Limited. — Capital, £1,000. Objects: to carry on the business of electrical and mechanical engineers, electricians, suppliers of electricity for light, heat, power, or otherwise, manufacturers of and dealers in electric, magnetic, telegraphic, telephonic, and other appliances and apparatus, etc.

British Tramways and General Construction Company, Limited.—Capital, £300,000. Objects: to carry on the business of financiers, concessionaires, contractors for public or private works, tramways, electric light, traction and power works, gas and water works, and means of transport, constructors of electric tramways or light railways, wires, cables, dynamos, motors, engines, rolling-stock, and the like, electricians, suppliers of electricity, etc.

Ulster Electric Power Distribution Company, Limited.—Capital, £10,000. Objects: to produce and supply electrical energy and power for public and private lighting.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Bath.—The Corporation invite tenders for the supply and erection of a main switchboard. Tenders by 12 noon on 27th inst.

Birkenhead.—The Corporation require tenders for one 350-kw. direct-current high-speed steam dynamo. Tenders by July 28.

Edinburgh.—The Corporation are prepared to receive tenders for the supply of arc-lamp posts. Tenders by Aug. 3. See advertisement.

Brighton.—The Town Council invited tenders for the supply of meters for a period of one year from Sept. 1, 1903. Tenders by Aug. 10. See advertisement.

Besszterczebanya, Neusohl (Austria).—The Municipality require tenders for the construction of an electricity station and plant of about 600 h.p. Tenders by Aug. 1.

London, S.W.—The London County Council invite tenders for switchboards. Particulars may be obtained at the County Hall, Spring-gardens, S.W. Tenders by Aug. 11.

Atherton.—The Urban District Council are prepared to receive tenders for the supply and delivery of electricity meters for an alternating-current supply. Tenders by 28th inst.

Pietermaritzburg.—The Corporation invite tenders for the supply of electric tramcars. Particulars may be obtained from Messrs. Mordey and Dawbarn, 82, Victoria-street, London, S.W. Tenders by July 29.

Colchester.—The Tramways Committee invite tenders for the erection of a tramcar shed, consisting chiefly of iron and steel. Particulars may be obtained upon application at the Surveyor's Office. Tenders by July 28.

Pointe-a-Pitre (Guadeloupe).—The Municipality invite offers for a concession for public and private electric lighting for 15 years. Tenders by Aug. 29. Particulars may be obtained from the Colonial Office, Paris.

Aldershot.—The Urban District Council invite tenders for the supply and erection at the sewage works of two 4in. motor-driven centrifugal pumps, also generator, battery, and automatic starting switches. Tenders by Aug. 4.

Hapton.—Tenders are invited for lighting the township with electricity. Particulars may be obtained from Mr. Edward O'Shaughnessy, clerk to the Hapton Parish Council, 16, Hamilton-terrace, Padiham. Tenders by July 31.

Lisbon.—The Public Works Department require tenders for the construction of 1m. gauge light railways as follows: (1) Limatal, Vianna-Ponte de Barca; (2) Oberer Minho, Braga-Monçao; (3) Braga-Guimaraes. Tenders by Aug. 1.

Atherton.—The Urban District Council invite tenders for the supply and delivery of electricity meters. Particulars may be obtained from Mr. D. Schofield, clerk to the Council, Town Hall. Tenders by July 28. See advertisement.

Rochdale.—The Corporation invite tenders for the supply and delivery of copper tramway rail bonds. Particulars may be obtained from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster. Tenders by 28th inst. See advertisement.

Blackburn.—The Town Council invite tenders for one complete main switchboard and accessories. Particulars may be obtained from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster. Tenders by July 27. See advertisement in last issue.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Launceston (Tasmania).—The Mayor and Aldermen invite tenders for the supply of 500 or more electric meters. Particulars may be obtained on application to Mr. William Corin, city electrical engineer, Launceston, Tasmania, or to Messrs. John Terry and Co., 7, Great Winchester-street, London, E.C. Tenders by Sept. 28.

Aldershot.—The Urban District Council invite tenders for the supply and erection at the sewage works of two 4in. motor-driven centrifugal pumps; also generator, battery, and automatic starting switches. Particulars may be obtained at the office of the Engineer and Surveyor to the Council. Tenders by Aug. 4. See advertisement.

London, S.W.—The London County Council invite tenders for the supply and delivery of two low-tension feeder switchboards, and for the erection of one of them in each of the Council's sub-stations at Camberwell and New Cross respectively. Particulars may be obtained at the County Hall, Spring gardens, S.W. Tenders by 10 a.m. on Aug. 11.

Wednesbury.—The Corporation invite offers from firms willing to undertake free and hire-purchase electric wiring and motors within the borough. Full particulars may be obtained from Mr. F. J. Warden-Stevens, the consulting engineer to the Corporation, 34, Victoria-street, Westminster. Tenders by July 30. See advertisement.

Bath.—The Corporation invite tenders for the supply and erection of a main switchboard at the new generating station. Particulars may be obtained from Messrs. Kincaid, Waller, Manville, and Dawson, 29, Great George-street, Westminster, or at the City Electrical Engineer's Office, 7, Dorchester-street, Bath. Tenders by 27th inst. See advertisement.

Rochdale.—The Corporation invite tenders for the supply and delivery of 16 double-deck, double-truck cars, 20 double-deck, single-truck cars, and five single-deck combination cars, with all trucks, motors, and accessories. Particulars from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster, and 78, King-street, Manchester. Tenders by Aug. 10. See advertisement.

Cheadle (Cheshire).—The Urban District Council invite tenders for the supply and delivery of about 350 tons of grooved steel girder tramway rails, eight tons of tie-bars, 13¼ tons of fishplates, and three tons of bolts and nuts; also for 17 sets of points and crossings. Particulars may be obtained from Mr. Charles R. Brady, A.M.I.C.E., 13, Warren-street, Stockport. Tenders by July 27.

Madrid.—The Posts and Telegraphs Department require tenders for the supply of 25 telegraph apparatus of the Hughes system and 25 motors with weight elevators for the same, for the service of the telegraph stations of the State, at the upset price of 2,530 pesetas, or about £73, for each apparatus with its accessories as detailed, and 408 pesetas, or about £12, for each motor with its corresponding elevator.

Cheadle.—The Urban District Council are prepared to receive tenders for the supply of materials and execution of works in the laying of concrete foundations, fixing rails, points and crossings for the tramway permanent way complete, including taking up present macadam and paving setts, but except fixing bonding. Particulars may be obtained on application to Mr. Chas. R. Brady, A.M.I.C.E., 13, Warren-street, Stockport. Tenders by 12 noon on Aug. 17.

Northampton.—The Corporation are prepared to receive tenders for the supply, delivery, and erection of the following in connection with the Corporation electric tramways: (Section No. 1) boilers, steam, exhaust, and water piping, condenser, cooler, water-softening

Digitized by Google

plant, mechanical draught, etc.; (2) steam generators, dynamos, battery, and booster, switchboard, travelling crane, station lighting, etc.; (3) overhead trolley equipment; (4) underground feeders, pilot, and telephone wires; (5) cars; (6) permanent way; (7) power station buildings; (8) car-sheds, workshops, offices, etc. Particulars on application to the borough engineer, Mr. Alfred Fidler, A.M.I.C.E., Guildhall, Northampton. Tenders by 12 noon on Aug. 15.

RESULTS OF TENDERS.

Govan.—The Corporation have accepted various tenders for the extension of the electric lighting station building.

Rochdale.—The Town Council have accepted the tender of W. A. Peters and Sons, Townhead, Rochdale, at £18,000, for erecting a permanent tramway shed.

Middlesbrough.—The Corporation have accepted the tender of Callender and Co., London, at £2,733, for carrying out the Grove Hall and Linthorpe electric lighting extensions.

Paisley.—The tenders of the British Schuckert Electric Company, Limited, have been accepted by the Corporation for extension of main switchboard, amounting to £633. 19s., and for 12-kw. negative booster, amounting to £220.

London, N.W.—The St. Pancras Guardians have accepted the tender of Barlow Bros. and Co., 237, Shaftesbury-avenue, W.C., at £1,093. 12s. 8d., for the wiring and fitting of the St. Pancras Infirmary, Dartmouth-park-hill, N., for electric light.

Islington.—The Lighting Committee recommend the acceptance of the following tenders: Brush Electrical Engineering Company, Limited, at £91. 10s., for the supply of 36 meters; Electrical Company, Limited, at £559. 4s., for the supply of 159 meters.

Birkenhead.—The Corporation have accepted the tender of Dobell and Co., Limited, Birkenhead, for the supply of washed slack, delivered at the Corporation electricity stations in Bentinck-street, Craven-street, and New Chester-road respectively, for 12 months.

Hampstead.—The Borough Council have accepted the tender of the St. Helens Cable Company for the supply of high-tension, house service, and rubber cable for 12 months, and that of Henley's Telegraph Works Company for the supply of three-core cable, also for 12 months.

Coventry.—The Electric Light Committee have accepted the following tenders: Aiton and Co., London, pipework, £1,138; Green and Co., Wakefield, economiser, £286; Bennis and Co., Bolton, coal-conveying plant, £1,032; Danks and Co., Oldbury, flue doors and damper doors, £90.

Rochdale.—The Corporation have accepted the following tenders: for the supply and erection of the overhead line equipment of the remainder of the tramway system, J. G. White and Co., Limited, £21,619. 13s. 10d.; points and crossings for special work and for entrance to car-shed, Lorain Steel Company, £2,587; points and crossings for the general track, Hadfield's Steelfoundry, Limited, Sheffield, £5,322.

Bradford.—The Corporation have accepted the following tenders for works required in the erection of a new electricity station at the Sunbridge-road destructor works: J. Moulson and Son, Limited, masons' work £980, joiners' work £175; Plasterers' Works Department, concretor and plasterers' work, £193 13s. 7d.; G. Jackson, plumbers' work, £79; Roberts and Co., Limited, ironfounders' work, £273; T. Nelson and Son, slaters' work, £37. 19s.; J. Lynn, painters' work, £20. 17s. 6d.

Walsall.—The following tenders have been accepted by the Corporation: Messrs. Wm. Griffiths and Co., Limited, for relaying the existing tramway track in Lichfield-street and Lower Bridge-street, and the construction of new loops on The Bridge, and a double track in Park-street, at £5,899. 15s.; Messrs. Robert W. Blackwell and Co., Limited, for supplying a first-class collapsible repair tower wagon, at £75; Messrs Percy U. Fellows and Co., for lighting the car sheds, offices, and yard at the tramway depot, Birchills, at £98. 12s.

Sleaford.—The Urban District Council have received the following tenders for supply and erection of water-tube boiler with piping, and 90-kw. steam generator and switchboard panel:

Boiler and piping.

Stirling Boiler Company, Manchester	£630
B. R. Rowland and Co., Reddish, near Stockport	599
Hornsby and Sons, Limited, Grantham	763
Stirling Boiler Company, Edinburgh	554
Babcock and Wilcox, Limited, London (accepted)	595
Babcock and Wilcox (alternative)	555

Engine and dynamo and switchboard.

Thomas Parker, Limited, Wolverhampton (accepted)	741

Bath.—Colonel Boughey, C.S.I., and Mr. H. Allan Steward, Light Railway Commissioners, have heard an application for an order authorising certain alterations and extensions of the Bath Electric Tramway Company's system. The Chairman said the Commissioners would be prepared to recommend an order, but they were anxious not to do anything to injure the hospital on the line of route. They would require the company to use wooden sleepers, the speed would be limited, and undue ringing of the bell would be guarded against. At Tuesday's meeting of the Town Council it was resolved that the question of the rebuilding of the Midland bridge be referred to a joint committee of the Electric Traction and Street Improvement Committees for further consideration, with instructions to report on the probable cost of improving the bridge and its approaches, and also to report to the Council further information as to the cost of the other improvements on the tramway routes.

BUSINESS NOTES.

TRACTION.

Salford.—The Corporation tramways will shortly be extended in the Ordsal-lane and Monton-green districts.

Rotherham.—The Board of Trade inspector in spected the Tinsley section of the Corporation electric tramways on Tuesday.

Gloucester.—Mr. Geo. Law, of Kidderminster, informs us that his tender has been accepted for the city of Gloucester tramways.

Blackpool.—The electric line on the new promenade from Alexandra-road to the south end of the promenade is now ready for service.

Rochdale.—There is every reason to believe that the electric cars will be running on several important central routes before the end of October.

Birkenhead.—The local bench have imposed a fine of 40s. on the driver of a cart for having obstructed a New Ferry electric car in New Chester-road.

Burton.—Arrangements are being made for the inauguration of the new electric tramways, and the first two of the 20 cars on order have arrived in the town.

Nottinghamshire and Derbyshire Tramways.—In the House of Commons the Nottinghamshire and Derbyshire Tramways Bill has been ordered for third reading.

West London.—It is announced that the London United Tramways Company intend to apply for a further extension of time for the construction of new lines in Uxbridge.

Chester.—The Town Council have received a memorial signed by 722 ratepayers asking the Council to at once proceed with the extension of the trams to Boughton and Tarvin Bridge.

Dewsbury.—On the 28th inst. the Government inspection of the electrical lines within the borough will take place. All the cables have now been laid, and the tramways are ready for working.

Rawtenstall.—It was stated at the last meeting of the Town Council that the construction of the electric tramways will be commenced soon. The scheme is expected to be completed within two years.

Hastings.—The first of the motor omnibuses ordered by the Corporation has been delivered, and will start running on the Fish-market to Grosvenor-gardens route in place of one of the horse-drawn vehicles.

Rowley.—The Birmingham and Midland Tramway Company have deposited plans of the proposed new tramway to be constructed from Old Hill to Blackheath. The matter has been referred to a committee.

Hull.—The work of preparing Hedon-road for the electric tramcar service is being rapidly pushed forward by the Corporation. Before the summer is past the electric cars are expected to be running along the route.

Central London Railway.—The directors have declared a dividend for the past half-year at the rate of 4 per cent. per annum, carrying forward £45,400. A year ago the distribution was at the same rate, with £25,000 carried forward.

Batley.—A communication has been received from the Board of Trade intimating that the inspection of the electric tramways within the borough will take place on Monday, July 27. A successful trial trip was made on Wednesday.

Railway and Tramway Competition.—Owing to the competition of the electric tramways in and around Leeds and Bradford, the Great Northern Railway Company are granting special and revised third-class fares in the districts affected.

Bilston.—The General Purposes Committee have decided not to relieve the British Electric Traction Company from their obligation to construct a tramline to Ettingshall, but if they prefer to construct the line *via* Ward-street they will consent.

Colne.—Good progress continues to be made with the construction of the tramways. A commencement has now been made with the laying of the conduits for the cables, while a number of poles have been received in readiness for the erection of the overhead equipment.

Glasgow.—Colonel Yorke on Tuesday inspected the Yoker-to-Clydebank extension of the tramways and that to the monument at Langside, both of which are already open, also the new line through the Green and along Govan-street connecting Alexandra Park with Paisley-road.

West Ham.—The Borough Council have arranged for the completion of the purchase of the tramway lines in the borough. Arrangements have also been made for the working of the same by the North Metropolitan Tramways Company pending the electrification of the lines by the Corporation.

Litherland.—The District Council have decided to call the attention of the manager of the Liverpool tramways to the delay in the commencement of the construction of the proposed tramway to Linacre. It had been promised that the trams would be running in June, but nothing has been done so far.

Blackburn.—The traffic returns of the Corporation tramways for the week ending July 10 show that the total number of passengers carried was 156,781, and that the receipts amounted to £878. 7s. 10d., as against 152,214 and £860. 11s. 1d. for the corresponding time last year, being an increase of 4,567 passengers and £17. 16s. 9d. receipts.

Paisley.—At a meeting of the Town Council on Tuesday a letter was read from Mr. W. Murphy, in which he stated with regard to the new tramways that he would be placing the orders for rails and

Digitized by Google

setts in the course of a few days. As soon as these were delivered, and which would be in as short a time as possible, the works would be commenced.

Leith.—The directors of the Street Tramways Company have negotiated with the Corporation of Leith for the sale of the tramways within the borough of Leith, subject to the approval of the shareholders. A special meeting of the company will be called to approve acceptance of the offer of purchase. The price offered by the Corporation of Leith is £60,000.

Birmingham.—The committee of the House of Commons presided over by Mr. Ashton on Friday concluded the consideration of the Bill by which the City of Birmingham Tramways Company seek power to extend their Yardley tramways to Shirley and Olton. At the conclusion of counsels' speeches the chairman stated that the committee found the preamble proved.

Ravensthorpe.—The removal of the telephone wires and posts from Hudderafield-road has been accomplished, and there appears to be nothing further to impede the traction company from opening their line through the village to Shepley Bridge, except that the sanction of the Board of Trade has not yet been received. Trial cars have been run with satisfactory results.

Poole.—The Poole and District Electric Traction Bill was on Friday before the Select Committee of the House of Commons on Unopposed Bills. Mr. Frere, parliamentary agent, explained that the object of the Bill was to obtain sanction to an extension of time for the purchase of lands in respect of which they already had powers. The Bill passed the committee.

Paris.—A Paris message dated Monday states that a tramway accident occurred at about six o'clock the previous evening in the Bois de Vincennes, near the Porte Jaune. A car coming from Nogent having had to stop, and its light having gone out, it was run into by another car going at full speed, and smashed up. Thirty passengers were more or less seriously injured.

Reading.—On Wednesday afternoon the Mayoress, in the presence of a very large company, opened the new electric tramways system, which has been laid down at a cost of £223,000, and which traverses a distance of 13 miles. Experts consider the service one of the finest in the country. Prior to the opening a large company was entertained to luncheon by the Mayor and Alderman Monck.

Shipley.—The Board of Trade inspection of the electric tramways from Nab Wood End, Shipley, to the Thackley boundary of that township took place on Thursday, and immediately thereafter the line was opened for traffic. The system of ½d. fares will be put into operation on this line, as also on the Baildon Bridge section which is expected to be ready for traffic a fortnight hence.

Electrical Plant.—The British Vice-Consul at Hanover calls attention to the change which is contemplated in the system of electric tramways there. The accumulator storage battery system which has been employed for the last 10 years in most of the streets in the town itself is to be superseded by the overhead wires. Enterprising electric companies may feel inclined to compete for this work.

Yorkshire Schemes.—The Tramways Order Confirmation (No. 2) Bill, which relates to tramways schemes promoted by the Horsforth Urban District Council, the Keighley Corporation, and the Ramsbottom Urban District Council, will shortly come before a committee of the House of Commons. The West Riding County Council have presented a petition in opposition to the Horsforth order.

Hove and Worthing.—The Corporation of Hove and the Urban District Council of Portslade having withdrawn their opposition to the Hove, Worthing, and District Tramways Bill, it is no longer a contested measure. It has consequently been withdrawn from the consideration of the Private Bill Committee and referred to Mr. J. W. Lowther, chairman of the Committee of Ways and Means.

Wakefield.—At the last meeting of the Town Council Alderman Atkinson called attention to the fact that he, along with the deputy-chairman of the General Works Committee and the assistant surveyor, had had interviews with the Corporation officials of Leeds, Bradford, and Dewsbury, with the view of ascertaining the best policy to follow respecting the laying down of single or double lines in narrow streets.

Metropolitan Railway.—A dividend is announced on the ordinary stock of the Metropolitan Railway Company for the past half-year at the rate of 2½ per cent. per annum, carrying forward about £26,000. The dividend on the surplus lands stock is at the rate of 2¾ per cent. per annum. Last year the dividend on the lands stock was the same, while the railway stock received 2¼ per cent., with £20,277 carried forward.

South Lancs.—The South Lancashire Electric Tramways Company are about to lay tramways from Four Lane Ends, near Bolton, where their system at present terminates, through Little Hulton, Walkden, and Swinton, joining the Manchester-Salford system. When this section, about six miles in length, is complete it will be possible to travel from Manchester to Liverpool by electric car, a distance of over 40 miles.

Dundee.—An abstract of the annual accounts of the tramways undertaking shows that the gross receipts for the year amounted to £42,605. 5s. and the working expenses to £28,166. 6s. 5d., leaving a balance of £13,838. 18s. 7d. This, however, is absorbed in interest, sinking fund, depreciation, and the annual payment to the old company, causing a deficit of £486. 13s. 9d. to be carried to debit of suspense account.

Berlin.—The Berlin Overhead and Underground Electric Railway Company have complied with the proposal of the municipal authorities that they should construct an underground extension of the system from the Potsdamer Platz right through the town, from the eastern to the western centre, where it will, for the present, terminate. The only point still to be decided is in regard to a municipal subsidy to the company.

Kirkcaldy.—Following on their decision to lay a double line of rails over their new tramway extension, the Town Council has lost no time in proceeding with the work. Part of the single line and loops laid in Victoria-road have been removed, and notices are being served on proprietors and tenants over the route with a view to obtaining their sanction to the double line, which is most favourably viewed by the general community.

Nottingham.—The Board of Trade have made an inspection of the latest completed section of the Corporation's electric tramways. This most recent extension of the tramways comprises a double line from the Derby-road end of Upper Parliament-street to the top of Market-street, with a single track down Market-street itself. A line has also been completed along Hartley-road, connecting Alfreton-road with the Radford-boulevard.

Newport (Mon.).—Major Druitt on Tuesday went over the Malpas-road section of the Corporation electric tramways and sanctioned it for public traffic. A new thoroughfare, Oakfield-road, is in process of construction, which would give good gradients for descending if, as is expected, Stow-hill is used only for the ascent of trams, thus following the practice found to be safe and useful in other towns where steep gradients have to be negotiated.

St Pancras.—As the County Council are anxious to proceed with the construction of a tramway extension on the electrical conduit system along Tottenham Court-road, they have again asked the consent of the St. Pancras Borough Council as the road authority concerned. The latter have decided to adhere to their resolution only to sanction the scheme as part of the general plan of linking up the tramways of north and south of the Thames *via* Charing Cross and Northumberland-avenue.

Bolton.—The South Lancashire Tramways Company have refused to accept the terms offered for the through running of their cars into Bolton, and the borough engineer has been requested to further negotiate with the company. The Tramways Committee have ordered a motor 'bus from the Stirling Motor Company. A letter has been received from the Secretary of the Board of Trade asking for drawings and descriptions of the type of lifeguards proposed to be fixed on the tramcars.

Light Railways.—The Board of Trade have recently confirmed the following light railway orders: (1) West Manchester Light Railways (Extensions and Amendment) Order, 1903, amending the Manchester Light Railways Order, 1899, and authorising the construction of additional light railways in the parish and urban district of Stretford and county of Lancaster; (2) Callington Light Railway (Extension of Time) Order, 1903, amending the Callington Light Railway Order, 1900.

Manchester.—According to a newspaper report, shortly after noon on Friday an accident occurred to one of the Corporation electric tramcars proceeding in the direction of Ashton, at Beswick. A flash of lightning struck the electric wire, and suddenly dislodged the trolley and smashed all the lamps in the car. The impetus sent the car along for a short distance. No one was injured, and the passengers continued the journey in another car, the trolley of the damaged car not being fit for further use.

Bexley.—At the last meeting of the District Council the engineers reported they had received notification from the town clerk of Woolwich that the formal consent of the London County Council to the widening of Wickham-lane in the borough of Woolwich had been received, and, the sanction of the Board of Trade having been obtained, the committee recommended the Council formally to resolve that the tramway track be constructed in the middle of the road as proposed to be widened.

Drighlington.—The tramway service between Drighlington and Bradford is reported to be a great success. There is a very convenient service of trams, which run about every 20 minutes, and the fares are very reasonable—it is only 3d. the full journey to Bradford, whilst the railway fare is 5d. single and 9d. return. A considerable advantage which working people find who have to work Bradford way is that they can make the full tram journey from Drighlington to Bradford for 1d. if they travel before 8 a.m.

Bournemouth.—On Friday the Bournemouth Corporation Tramways Bill came before the Select Committee on Unopposed Bills, Mr. Jeffreys, deputy chairman of committees, presiding. Sir E. Chandos Leigh, the Speaker's counsel, said there were two Bills before the committee relating to this district—the Bournemouth Corporation Tramways and the Poole and District Electric Traction—but they were virtually one and the same. The Bill passed the committee, and was ordered to be reported to the House.

Newcastle.—A collision occurred one night last week between two electric tramcars at the corner of the North-road and Jesmond-road. While an Osborne-road car was turning into Jesmond-road shortly before eight o'clock, the trolley slipped from the wire and the car stopped at once half way round the turn. A Gosforth car was coming up behind, and before the driver could pull up the car dashed into the rear of the Osborne-road car with considerable violence. Both cars were slightly damaged, but no one was hurt.

Mid-Yorkshire.—The Mid-Yorkshire Tramways Bill, which has already passed through the House of Lords, has come before the Unopposed Committee of the House of Commons, Mr. J. W. Lowther presiding. The object of the Bill is to incorporate the Mid-Yorkshire Tramways Company, and to empower that company to make and maintain tramways and other works, and for other purposes. The preamble having been formally proved, the Bill was passed through the committee stage, and ordered to be reported for third reading.

District Railway.—It is stated on the authority of Mr. J. R^{d} Chapman, chief engineer of the Underground Electric Railways Company, that London will not be able to enjoy the electrified underground line until the end of next year. The work which is taking up

Digitized by Google

the time is the building and equipping of the generating station at Lot's-road, Chelsea. The power-house at Neasden, which the Metropolitan Railway Company are building, is likely to be completed by the end of 1903, and will supply sufficient power to run 40 trains on the Inner Circle.

Huddersfield. — The Tramways Committee have accepted a recommendation of the Traffic Sub-Committee to adopt a merit system of graduated awards in the form of increased wages to the employés for good conduct and length of service. The borough treasurer reports that the receipts for the three months ended June 30 amounted to £16,749. 16s. 5d., or 9·81d. per car mile run. The expenditure amounted to £18,485. 13s. 3d., or 10·82d. per mile, thus showing a deficiency of £1,735. 16s. 10d., or 1·01d. per mile. The figures include £2,921. 16s. 3d. allowed for depreciation and £6,665 interest and sinking fund.

South Staffordshire.—The Bill to confirm agreements for leases to the South Staffordshire Tramways Company of certain portions of the Wednesbury and Handsworth tramways, and to confer further powers on the company for the working of tramways by electrical power, came before one of the examiners of private Bills for proof of compliance with the Standing Orders of the House of Commons. There was no opposition at this stage, and on the requisite proof the examiner certified compliance, and reported the Bill in the form in which it has already passed the House of Lords for second reading.

Additional Traffic Returns.—Anglo-Argentine, £1,061 increase; Barcelona Ensanche y Gracia, £219 increase; Barcelona, £323 decrease; Brisbane, £295 decrease (month of June, £9,575, decrease £612); British Columbia Electric (month of March), gross earnings £10,352, net income £2,658; Buenos Ayres and Belgrano Electric, £154 increase (month of April, £12,995, increase £1,123); Calcutta, £436 increase; Cape Town (month of April), receipts £16,003, expenditure £8,313; Isle of Thanet Electric, £27 increase; Mexico Electric (month of June), recepts £46,270; Perth Electric, £62 increase; Port Elizabeth (month of April), receipts £4,292, expenditure £2,281.

Dewsbury and Batley —The Dewsbury, Batley, and Birstall Tramways Bill, which has already passed through the House of Lords, came on Friday before the Unopposed Committee of the House of Commons, Mr. J. W. Lowther presiding. The object of the Bill is to authorise the construction of a new tramway in the urban district of Ravensthorpe, and the electrical equipment and reconstruction of tramways in the boroughs of Dewsbury and Batley, and urban districts of Gomersal, Birkenshaw, Soothill Upper, and Birstall, and for other purposes. Formal proof of the preamble having been given, the Bill was passed through the committee stage, and ordered to be reported for third reading.

North Somerset Light Railway.—On Tuesday Colonel Boughey, C.S.I., and Mr. Henry Allan Steward, Light Railway Commissioners, sat to hear the application for an order authorising the construction of a light railway in North Somerset some seven miles in length, commencing at Midford and continuing to Preston. It is proposed that the line shall be a single one of standard gauge. Mr. Sidney William Yockney, C.E., stated that the estimated cost of the line is £57,000, and a short spur line £3,000. Ultimately decision was reserved to give an opportunity to the Great Western Railway to consider whether they should not endeavour to make some satisfactory arrangement with the promoters.

Lowestoft.—On Thursday afternoon last week Mr. A. B. Trotter inspected the overhead electric equipment of the tramways. Some public interest was manifested as the car approached the swingbridge, which, however, it negotiated capitally. Here aluminium rods are used instead of the customary copper wire, and these are so fixed that when the bridge is turned "off" they disconnect themselves from the runner on each side and again interlock with a spring when the bridge is closed again. The inspector expressed himself satisfied with the way the work has been carried out. Colonel Von Donop visited Lowestoft on Tuesday to inspect the cars and permanent way. The system was formally opened on Wednesday, when the cars commenced running for public traffic on about five and a half miles of line.

Blackwall Tunnel.—At their fortnightly meeting the Poplar Borough Council had under consideration the question of the proposal of the London County Council to run tramways through the Blackwall Tunnel. The General Purposes Committee of the Borough Council reported against the proposal, and recommended that the consent of the Council be withheld. On behalf of the committee it was urged that the tunnel was too narrow to allow of a double line of tramways, and that a single line would result in the traffic being blocked. Mr. Barge, the chairman of the committee, said that a suggestion had been made to abolish the footpaths through the tunnel, lay down a double line of tramways, and convey passengers in the cars free of cost. Eventually the report was referred back for further consideration.

Private Bills.—The following Bills which have already passed the House of Lords came before a House of Commons Committee as unopposed measures, and were ordered to proceed: Mid-Yorkshire Tramways Bill; Dewsbury, Batley, and Birstall Tramways; and Burton-upon-Trent, Leeds, and Huddersfield Tramways. The Lords' amendments to the Metropolitan District Railway (Various Powers) Bill have been agreed to by the Lower House. The Dudley, Stourbridge, and District Tramways Bill and the Poole and District Electric Traction Bill were considered in the House of Commons on Friday, and ordered for third reading. The South Stafford Tramways Bill has been read a second time in the Commons, and the City and South London Railway Bill and the Romford and District Tramways Bill a third time.

Bromley (Kent).—On Friday the Light Railway Commissioners held an enquiry at the Royal Bell Hotel, Bromley, into the application of the British Electric Traction Company for an order empowering them to construct and work light railways in the parish of Bromley going from the Lewisham boundary of the district at Bromley-hill, right through the town, and continuing to Farnborough and Green-street-Green. The total cost of the scheme was estimated at £73,335. Colonel Boughey gave the decision of the Commissioners. He said that no evidence had been called for the important part of the scheme north of Bromley South Station, and under all the circumstances, and having regard to the opposition indicated by the Urban Council and by the residents and others, they would not be prepared to consider the application any further.

Camberwell.—The Borough Council have received a letter from the London County Council intimating that that Council have resolved to exercise the powers conferred by the London County Council (Tramways and Improvements) Act, 1902, in respect of the widening of Denmark-hill, Champion-park, Grove-lane, Dog Kennel-hill, Grove-vale, and Lordship-lane, the Camberwell Council having agreed to make the necessary contribution towards the cost of the Camberwell portion of the scheme. The Borough Council have also received a letter from the secretary to the London General Omnibus Company, Limited, calling attention to the fact that the London County Council or other tramway owners have no power to lay a rail for tramway work unless the uppermost surface of the rail is on a level with the surface of the road (Tramways Act, 1870, Section 25), and suggesting that the Council should take legal opinion as to the liability of the County Council for damages should accidents occur through improper rails.

Southport.—Another discussion of the question of running Sunday trams has taken place in the Town Council. Recently a poll of the ratepayers resulted in a majority of nearly two to one against the running of the cars, but Councillor Travis, chairman of the Tramway Committee, at the last meeting remarked that one-third of the ratepayers voted against Sunday running, one-sixth in favour of it, while the remaining half seemed indifferent as to the result. A resolution stood on the minutes to the effect that on receipt of a demand in writing from the Southport Tramway Company the electrical engineer be instructed to supply current on Sundays for purposes other than running of trams; this proposition found three supporters only. A resolution was carried instructing the electrical engineer to supply current for purposes other than plying carriages for hire upon the tramways in Southport on Sundays. There was a desire evinced by some members of the Council to lay bare the whole of the facts, but to a great extent discussion was stifled with the object, as one councillor said, "of not disclosing their hand." Interesting developments are expected in the law courts.

South London.—The work of reconstructing the short section of the London County Council tramways between Kennington-gate and the beginning of the cable in Brixton-road is practically complete with the exception of the paving, and several experimental trips have been made with the new cars. An interesting arrangement has been made for the transformation at the junction of the two systems. The electric plough has to be raised, and the cable "gripper" is then run under the car and fixed in the manner which is familiar to all who use the present service. On the return journey the reverse operation takes place, the "gripper" being released and the plough replaced in position. The Council's engineer has devised an ingenious system by which at the point of transformation the electric and the cable slots are for a little distance side by side, the former being diverted towards a hatchway in the road through which the plough can be reached. It is expected that the delay in fixing will be very slight. A soon as the line has been inspected by the Board of Trade, the new trams will be run from Westminster at first, and afterwards from the other termini. At the same time the line from Kennington Church past the Oval to Vauxhall is complete, except that there is some paving still to be done, owing to the widenings which have been carried out.

Light Railways in Kent.—A committee of the House of Commons presided over by Mr. Gair Ashton gave its decision on Wednesday last week on the Bills promoted by the Corporation of Rochester and the Chatham and District Light Railways Company for the construction of several lines of electrically-worked tramways. The Bills were originally competing measures, but during their consideration by a Select Committee of the House of Lords an arrangement was come to between the Corporation and the company, and the Bills were allowed to proceed concurrently. The tramways to be constructed by the Corporation are wholly within the boundaries of Rochester. A number of street widenings and improvements are also contemplated, the total cost of the scheme being estimated at £140,557, of which £66,109 is for the construction of the tramways inclusive of the overhead electrical equipment and the distributing cables. The main proposals of the company are the construction of a new tramroad, 3½ miles long, from Chatham to Rainham, and one from Chatham to Maidstone, a distance of about seven miles. The line from Chatham to Maidstone, the estimated cost of which is £63,585, is to be laid chiefly on private land and not on the public highway. By this means it is hoped to secure a faster service than would be possible on the public roads. It is also intended to utilise the line for the purposes of a goods service as well as for the conveyance of passengers. The committee, having heard evidence in favour of, and in opposition to, the two schemes, found the preambles of both Bills proved.

Wellington (N.Z.).—The electric tramway contracts with the Electric Construction Company and Messrs. Marcartney, M'Elroy, and Co. have been duly executed, and Mr. J. H. Woodward (assistant to Messrs. Preece and Cardew) is to act as representative for Mr. Wright, electrical engineer of Wellington, who is now on his way to the colony, whilst Mr. Howard Smith is to inspect the material for the permanent way. We have received from New Zealand the annual report of the city engineer and surveyor of the city of Wellington, Mr. R. S. Rounthwaite, showing the work carried out or in preparation by his department during the year ended March 31 last. In it interesting reference is made to the tramway scheme which is being

Digitized by Google

promoted by the municipality. Although this work had not been commenced on the date named, specifications and conditions of contract for the supply of timber for wood paving, stone setts for tramway borders, Portland cement, etc., had been prepared. In connection with the scheme, it will be necessary to carry out some street widenings, especially at curves, and arrangements are being made to this end. With regard to water power for the generation of electricity, the engineer has submitted a report advising that the dry-weather flow of the Hutt and Alratarana rivers is not sufficient to give the necessary volume and head for producing the energy required without the construction of expensive impounding works. At a later date the engineer, together with Messrs. Allo and Barton, visited the higher reaches of the Hutt river. Mr. Allo, who was specially brought out by the Government to give expert opinion upon the possibility of utilising the various rivers of the Colony for generating electrical energy, has already submitted his report upon this scheme, and confirmed in the most emphatic manner the conclusions previously reported by Mr. Wright, the electrical engineer of Wellington, and Mr. Rounthwaite.

Cardiff.—During a discussion at a meeting of the Finance Committee on Monday a question was asked as to whether £9,500 odd profit had been made by the tramways, as one of the officials had stated at the previous Monday's Council meeting that the sum of £8,800 borrowed by the Tramways Committee had been paid back by the Finance Committee, while another official said directly opposite. Mr. Courtis, chairman of the Tramways Committee, explained that the £8,800 was borrowed for the purpose of covering the loan charges and interest on money borrowed for the purpose of constructing certain lines before they took over the old tramway company's service. In 1903 they made an estimate for £9,000 to meet the sinking fund, and when they made up their accounts for 1903 they found that they had sufficient money to repay. Mr. F. J. Beavan said the £9,500 was not really a surplus, and it was an unfortunate thing that the balance-sheet should have been issued until it had been before the Finance Committee. The sinking fund ought to have been allowed to go on to the same date on the traffic receipts. Mr. Courtis provisionally agreed to this, and added that the balance-sheet had only been before a sub-committee, and would yet have to go before the Finance Committee. Mr. Lewis (deputy borough treasurer) said the proportion of loan charges in respect of the three months would be £4,459, to which must be added £2,903. 17s. 3d. interest and £2,310 for management. Mr. Beavan observed that if the sums just mentioned were deducted from the surplus, the profit would be reduced to £2,475. 4s. 10d., which, he held, was the legitimate result of the year's working. Mr. Blow said the balance-sheet issued was only an informal document, whereupon Mr. Courtis said it was an official balance-sheet, but it was yet to go to the financial department. The decision arrived at by the Corporation to construct for electric traction the tramlines from St. Mary-street through Penarth-road to the junction of Clare-road and Corporation-road is to be made the subject of an appeal to the ratepayers.

Walsall.—The Board of Trade have consented to the relaying of the existing tramway track in Lichfield-street and Lower Bridge-street, and the construction of the new loops on the bridge, and a double line in Park-street, and have also approved of the proposed mode of construction. The consideration of the question of altering the track at the Brown Lion Inn has been deferred until the borough surveyor has had an interview with managing director of the South Staffordshire Tramways Company. The Tramways Committee of the Town Council have been considering what arrangements it is necessary should be made for efficiently managing the tramway undertaking by the Corporation as from Jan. 1 next, and the town clerk has obtained from a number of corporations owning and working their tramways on the overhead system information which has been of material assistance to the committee. The total mileage to be worked by the Corporation is 12 miles 3 furlongs 2·07 chains. The committee recommend that the tramway manager receive a salary of £200 a year, rising to £250 by annual increases of £25, and make several other recommendations with regard to the staff. The committee recommend that the upkeep of the generating plant for tramway purposes, both at Woverhampton-street and the transformer sub-stations, and the interest and instalment on the capital expenditure, estimated at £20,000, for providing the tramway electrical plant and sub-stations, and also any further expenditure for supplying current to the tramways, be charged to the Electric Lighting Committee, such committee to undertake at their own cost the charge, control, and upkeep of all such plant; that there be charged to the Tramways Committee the cost of the street equipment—namely, feeders and overhead wires—and that the expenditure be allocated accordingly. In considering the price to be paid for current, the committee estimate that about 500,000 car miles will be run per annum, and that the annual consumption of current, based upon such mileage, will be about 560,000 units. The committee recommend that the Electric Lighting Committee be asked to fix the minimum price of current for tramway purposes at not exceeding 2d. per unit, and informed that, if practicable, it is hoped they will be able to adopt a sliding scale of charges, so that as the consumption increases the price will be reduced.

London County Council.—At the usual weekly meeting of the London County Council on Tuesday there came up for discussion the report of the Highways Committee (given in our last issue) recommending the construction of new tramways of a total length of just on 30 miles, and the doubling and reconstruction of existing tramways of a total length of 3¾ miles, at an estimated cost of £1,580,325, the estimated cost of the necessary street widenings being £722,230—a total of £2,302,555. Mr. Sears, chairman of the Bridges Committee, moved an amendment to drop out of the scheme the proposed tramway through Blackwall Tunnel. On the other hand, Mr. Benn urged the public convenience of the proposed tramways, and the amendment was rejected by a majority of 9 to 5. The whole scheme was then adopted, and it was decided to seek parliamentary powers to carry it out. The recommendations of the Improvements Committee for seeking parliamentary powers for certain street widenings to accommodate the tramway scheme just sanctioned were after discussion adopted. The gross cost of the street improvements is £722,230, towards which the tramways account is to contribute one-third. The local authorities are to be asked to contribute another one-third, so that only one-third will form a charge on the county rate. In reply to questions, Mr. Benn said that, as a result of negotiations with the City Corporation, he hoped the Council would be enabled to carry a tramway over Southwark Bridge. The Improvements Committee brought up a report recommending: (*a*) that tenders be invited by advertisement for the construction of a tramway subway and of a subway for pipes and wires, and for the paving, etc., works between Great Queen-street and Holborn and between Eagle-street and Vernon-place; (*b*) that the operation of the standing order which requires that all tenders in respect of works estimated to cost £500 shall be opened in the Council by the chairman be suspended so far as may be necessary to enable the chairmen of the Highways and Improvements Committees to open during the ensuing recess the tenders referred to in the foregoing recommendation, and to accept on behalf of the Council the lowest satisfactory tender, subject to any action taken in the matter being fully reported to the Council at the first meeting after the recess; (*c*) that the employment of a resident engineer and of a clerk of works be sanctioned in connection with the above-mentioned works at a total cost not exceeding £550.

Bradford.—Mr. C. J. Spencer, the general manager, has issued his annual report on the work of the city tramways for the year ended March last. The principal figures have already been published, but the point has not yet been finally disposed of—viz., what is to be done with the balance. Its exact amount is £19,849. 17s. 4d., equal to 1·187d. per car mile run. Seeing that the total receipts per mile are 10·377d., this would seem at first sight a small margin to have left. But, to begin with, ordinary expenditure absorbs a little over 7d., and interest on loans and sinking fund charges account for more than 2d. Mr. Spencer enters largely into the peculiar local circumstances which have to be encountered in working the tramways in Bradford, and mentions that the proportion of fixed charges to gross receipts is as high as 20 per cent. This, he says, is accounted for by the fact that the Bradford system is about equal in size to systems in cities with double and treble the population. He then goes on to make a comparison with "a neighbouring city," a thinly-disguised reference to Leeds, where with a capital of only 17 per cent. more than Bradford the cars earn 51·4 per cent. more money. The amount of current consumed alone is 23 per cent. higher per mile in Bradford than in Leeds. "The working expenses are necessarily much higher in Bradford than in the average town, owing to its steep gradients and consequent heavy current consumption, and also to the heavy wear and tear of rolling-stock and permanent way." One much-discussed item does not appear in the balance-sheet, and that is depreciation. The department, however, has a reserve fund of £23,000. Items under the head of "maintenance" sufficiently illustrate the extent of the repairs to the system during the past year: cars, tools, etc., £24,956. 7s. 9d.; permanent way, £5,758. 14s. 2d.; and overhead equipment, £1,804. 6s. 1d. The total receipts of the year amounted to £173,534. 5s. 6d., or 10·377d. per mile. The expenditure amounted to £117,495. 16s. 4d., equal to 7·026d. per mile, which leaves a gross trading profit of £55,038. 9s. 2d. From this is deducted £36,188. 11s. 10d., representing interest on loans and sinking fund, leaving the before-mentioned disposal balance of £19,849. 17s. 4d. In some interesting statistics, Mr. Spencer mentions that the passengers carried during the year were 41,000,000, and the car miles run 4,013,191. The average length of the 1d. stage in Bradford is 1 mile 1,156 yards, and the number of miles in the system is 39. A committee of the House of Commons has found the preamble proved of the Corporation Bill, which, amongst other things, authorises further extensions of the tramways system at an estimated cost of £29,397.

New Issues.—This week subscriptions have been invited by the Manchester and Liverpool Electric Express Railway Company for its capital of £2,100,000 in £10 shares. The company was incorporated by an Act of Parliament in August, 1901, empowering the company to construct and work an electrical railway between Manchester and Liverpool on Behr's monorail system. The prospectus states that the Manchester terminus of the railway will be on the west side of Deansgate, within a distance of about 600 yards from the exchange and about 400 yards from the town hall, while the Liverpool terminus will be closely adjoining Church-street, and within a distance of about 700 yards from the exchange and town hall. The length of the railway will be about 34½ miles, and the time occupied in the transit will be 20 minutes, instead of 40 to 45 minutes, the time at present taken by the fastest express train running between Manchester and Liverpool. It is proposed to work this new line at a speed of 110 miles an hour, the trains running every 10 minutes, or, if necessary, more frequently. Mr. S. B. Cottrell, the engineer and general manager of the Liverpool Overhead Electric Railway, estimates that the total annual expenditure for traction, maintenance, and working expenses would amount to £65,554 per annum, equal to a cost per train mile of about 7½d. It is computed that on this basis an average of 7½ third-class passengers carried per train would, therefore, cover all working expenses. An average of 20 passengers per train, or 2,000 per day in each direction would, it is estimated, be sufficient to pay 5 per cent. per annum upon the capital, and every additional 2½ passengers per train will be sufficient to pay about an additional 1 per cent. interest. The company is authorised to pay interest at the rate of 3 per cent. per annum on the amount for the time being paid up on its shares during construction, but the aggregate amount is not to exceed £150,000. Subscriptions were also invited by the Auckland Electric Tramways Company, Limited, for an issue at par of £200,000 5 per

Digitized by Google

cent. first mortgage debenture stock, part of a total of £285,100 which the company is authorised to issue. The stock is redeemable at £105 per cent., after 1912, on six months' notice, and a 1 per cent. sinking fund is to be maintained for purposes of redemption. The prospectus states that the company, which has a share capital of £300,000 (£285,100 paid up) was formed in 1899 by the British Electric Traction Company to acquire a tramway undertaking in Auckland City, New Zealand, and to construct certain extensions; 14½ miles are now under electrical operation, and a further two miles will shortly be completed. The capital expenditure is estimated to amount to £535,000, and it is principally to repay the money borrowed that the present issue is made.

LIGHTING AND GENERAL.

Lowestoft.—The minimum charge for power purposes has been fixed at 10s. per quarter.

Gainsborough.—The Urban District Council have decided to take steps to apply for an order to supply the district with electricity.

Hebden Bridge.—The Urban District Council have received sanction to borrow £10,260 for their proposed electricity scheme.

Power Bills.—The Carmarthenshire Electric Power Bill and the Fife Electric Power Bill have been read a third time in the House of Commons.

Kingsteignton.—Edmundsons' Electricity Corporation intimate their intention of applying for a provisional order to supply electricity to this place.

Huddersfield.—The borough electrical engineer reports that the total length of mains laid on July 1 was primary 80,679 yards, secondary 58,031 yards.

Maximum Demand Indicator.—We have pleasure in stating that the Atkinson-Schattner maximum demand indicator has been approved by the Board of Trade.

Newry.—The Guardians have decided to introduce a system of electric bells in the infirmary, and to connect the fever hospital with the house by telephone.

Grimsby.—On Tuesday Mr. W. O. E. Meade-King held an enquiry into the application of the Town Council to borrow £7,000 for the purpose of electric lighting.

Fleetwood.—The School Board are negotiating with the local electric lighting syndicate as to connecting the new Board school with their electric lighting system.

Ham.—Edmundsons' Electricity Corporation have given notice that they intend to apply for an order empowering them to supply electric light and power in the district.

Stourbridge.—After long consideration the Council have determined not to sell their electric lighting provisional order to a company, and will keep it in their own hands.

Ramsgate.—The Town Council have given the light railway company one week in which to come to a decision as to their taking over the Council's electric lighting order.

Hanwell.—This district is proposed to be supplied with electricity by the Southall Electric Supply Company, who have given notice of an application for a provisional order.

An Electric Lighthouse.—It is stated that on the first night of the trial of the new electric arc lighthouse on Heligoland the light was visible at Busum, a distance of 40 km.

Aberaychan.—The South Wales Electrical Power Company have given notice of their intention to lay further cables in the Council's district, from Havodyrnys to Pontypool.

Loughborough.—The Town Council are seeking the sanction of the Local Government Board to appropriate certain land for the purposes of their electrical undertaking.

Wimborne.—The Southern District Electrical Supply Corporation intend to apply for a provisional order authorising them to supply electricity within the area of the urban district.

Rhyl.—Application to the Local Government Board has been authorised for leave to borrow £2,000 as working capital for the electric lighting undertaking of the Urban District Council.

Stratford-on-Avon.—Notices have been received from two companies of their intention to apply to the Board of Trade for provisional orders for supplying electricity within the area of the Council.

Rawmarsh.—The Empire Electric Light and Power Company, Limited, have given notice that they intend to make application for a provisional order to supply electricity within the Council's area.

Wilts.—On account of the high cost of providing an efficient service, the Standing Joint Committee of the County Council have decided not to connect up the county police station by telephone.

Taunton.—It was stated at the last Town Council meeting that the gas company have refused to put gas in certain houses unless the electric light is taken out. The town clerk is looking into the matter.

Blackpool.—Returns from the electricity works for the month ending June, as presented at the last meeting of the Tramways and Electricity Committee, show an increase in the works output of 33,306 units.

Whitehaven.—The terms on which the Corporation will supply electric lighting to the workhouse are that the rate of charge shall be 6d. per unit, the Guardians to pay rent of £100 per annum to merge in the unit charge.

Ashton.—It has been decided to supply electric current to the town hall, police station, and other municipal buildings direct from the electricity works, the old gas-engine plant previously used for this purpose being dispensed with.

Rawtenstall.—A draft agreement has been prepared for the supply of electrical energy to the Corporation by the Lancashire Electrical Power Company. The company have commenced the erection of a generating station at Radcliffe.

Chichester.—The draft agreements, as finally settled, relating to the transfer of the Corporation's provisional order to the Chichester and District Electric Supply Company, Limited, have been approved and adopted by the City Council.

Brandon.—An application from the Empire Electric Light and Power Company, of Romford, for leave to make an installation of the light in the district has been received by the Rural District Council and deferred for further consideration.

Limerick.—An enquiry has been held at the town hall relative to the application of the Corporation for a further loan of £7,000 from the Board of Works to extend the electric installation in the city, for which a sum of £22,000 has been already sanctioned.

Hampstead.—Having regard to the suggestion made by the factory inspector as to the necessity of enlarging some of the street transformer stations, 21 further sub-stations are to be altered (one sub-station having been so treated) at an estimated cost of £1,080.

Kingswinsford.—The Rural District Council are in negotiation with a company for the electric lighting of the district. Mr. Fiddian has been asked to report to the Council with regard to gas and electricity for the pumping stations at Ashwood and Wordsley.

Anglo-American Telegraph Co.—The directors have resolved, after placing the sum of £6,000 to credit of the renewal fund, to declare an interim dividend for the quarter ended June 30 of 15s. per cent. on the ordinary stock, carrying forward a balance of about £1,468.

Port Arthur.—A wireless telegraphy station has been established at Port Arthur at a place known by the name of the Golden Mountain, with the object of organising a regular telegraphic communication between Port Arthur and the Russian warships in the Gulf of Pechili.

Whittlesey.—A letter was read at the last Rural District Council meeting from the Phodyne Electrical Company, Limited, giving notice that it is their intention to apply to the Board of Trade for a provisional order authorising them to supply electricity in the district.

Hammersmith.—Numerous tenders, varying considerably in prices, have been received by the Borough Council for the supply of arc lamps and accessories required in connection with the electric lighting on the new tramway routes and in Glenthorne-road, and have been referred to committee.

Friern Barnet.—The matter of the lighting of the district has been discussed by the Lighting Committee, and the surveyor has been directed to ascertain upon what terms the North Metropolitan Electric Power Supply Company will undertake to supply electric light in the district.

Alloa.—At the last meeting of the Town Council a letter was read from Parliamentary agents of the British Electric Plant Company giving notice that the company propose to apply to Parliament for a provisional order for enabling them to supply electrical energy to Devon Valley district.

Portsmouth Telephones.—There are now some 1,240 lines completed and in working order in connection with the municipal telephone exchange, and Mr. C. M. Gardner, the manager, is to be congratulated on having brought the undertaking to so progressive a stage in so short a time.

Liverpool.—One of the electric mains running under the pathway just outside St. John's fish market fused on Wednesday last week and became ignited. The fire brigade rendered assistance, and in the course of a few minutes the cable was reached and severed, resulting in the fire being speedily extinguished.

Electric Launch.—An electric launch has been put upon Derwentwater, principally for use by visitors. The craft is about 35ft. long, and will accommodate 20 passengers. The engines are of 6½ h.p., driven from storage cells, which are charged by the dynamo used for electric lighting at Lodore Hotel.

Radstock.—The clerk to the District Council has been instructed to obtain the terms proposed to be charged by the Western Distributing Electrical Corporation to consumers, and if such terms should prove satisfactory the Council will support the company in their application for a provisional order for Radstock

Colwyn Bay.—At the last meeting of the Urban District Council it was decided to reduce the price of electricity to consumers of over 10,000 units per annum to 4½d. per unit. Current for motive power on the new promenade works has been offered at 2½d. a unit, with a maximum consumption of 80,000 per annum.

Greenock.—During June 33,265 units were generated for private and public supply, and 61,313 units for traction supply. This is a total increase of 16,478 units when compared with the previous June. The number of consumers was 341—an increase of 69—and the lamps for private supply were equal to 41,155 8-c.p. lamps.

Milngavie.—The Clyde Valley Electrical Power Company are going to apply to the Board of Trade for power to lay mains throughout this district. The sanction of the Town Council has been sought to the company supplying electricity and power within the burgh, and a committee has been appointed to deal with the question.

Kingswear.—The necessary permission having been obtained for lighting this place by electricity, the Urban Electric Supply Company, Limited, Dartmouth, are now pushing on with the mains with all possible dispatch to meet with the wishes of the Parish Council, who are anxious to see the streets electrically lighted as soon as possible.

August Holiday.—Messrs. Willans and Robinson ask us to state that their works and offices will be closed from Saturday, Aug. 1, to

Digitized by Google

Monday, Aug. 10, for the usual annual holiday. The British Prometheus Company have arranged their summer holiday at the same time, closing their works from Friday, 31st inst., till Tuesday, Aug. 11.

Newton Abbot.—Notice has been received by the District Council from the Urban Electric Supply Company stating that they intend to apply to Parliament for a provisional order for permission to lay electric cables in Kingsteignton, and asking whether the Council would give their consent. The Council have determined to withhold their consent.

Eastern Telegraph Co.—The accounts of the Eastern Telegraph Company show that, after payment of the interim dividend of £1. 5s. per cent. on the ordinary stock to Dec. 31, a balance sufficient to pay a final dividend of £1. 5s. per cent. and a bonus of £2 per cent. on the ordinary stock, making a total distribution of 7 per cent. for the year.

Tewkesbury.—Notices have been received from the National Provincial Electricity Corporation, Limited, and the Empire Electric Light and Power Company, Limited, of their intention of applying to the Board of Trade for provisional orders for supplying electricity within the Council's area. The matter has been referred to the Electric Light Committee.

Chesterton.—The Potteries Electric Traction Company have been asked on what terms they could supply electric lighting to the village. A committee of the Parish Council has been appointed to procure all the necessary information on the subject of lighting the streets, the probable cost, and the amount of rate necessary for repayment of any loan that may be contracted.

Hampton (Surrey).—The Empire Electric Light and Power Company have informed the District Council of their intention to apply for a provisional order to supply electricity within the Council's area. The Council have already obtained a provisional order authorising them to supply electricity within their district, and are taking active steps to carry the same into effect.

Change of Address.—We are notified that Mr. Frank Broadbent, consulting and inspecting electrical engineer, has removed to 4, Queen-street-place, E.C. Mr. H. D. Wilkinson has removed to the same address. Mr. Arnold G. Hansard, consulting electrical engineer, also has removed to 53, Victoria-street, Westminster, S.W. His telephone number will in future be P.O. Victoria 60.

Barnstaple.—The Town Council have received the sanction of the Local Government Board to borrow £5,400 to extend the electric light outside the central area. This sum, added to the £21,600 for which borrowing powers had previously been obtained, makes the £27,000 which the Council originally applied for to complete the installation of the electric light throughout the borough.

Littleborough.—The Council have sealed an agreement with Littleborough School Board for the supply of electricity. The price to be charged is 8d. per unit for all units consumed, and the agreement provides that six months' notice to terminate may be given on either side. If after a time the Council find they can supply electricity to the School Board at a cheaper rate, they agree to do so.

Hand-Book.—We have received an advance copy of the Great Eastern Railway Company's hand-book, "Holiday in Eastern Counties," issued in convenient pocket size. Prominence has been given to some less-known districts in East Anglia, and the illustrations have been made a special feature. A list of East Anglian golf links, which is given for the first time, lends additional interest to the issue.

Bilston.—A letter was read from the Midland Electric Corporation at the last meeting of the District Council offering to supply energy to the public buildings at a reduced rate of 2d. per unit for seven years, subject to the right of the Council to call upon the company to carry out the public lighting of the streets being waived for five years. The Council decided to waive their right in consideration of the reduction in price.

Shrewsbury.—The Lighting Committee reported that the satisfactory progress of the electric light undertaking is such as to warrant a reduction being made to the consumers in the price charged for the electric light, and they have decided that the initial charge shall henceforward be 6d. per unit instead of 7d. In addition to this, the usual rebate under the maximum demand system will continue to be made as heretofore.

Portsmouth.—In connection with the drainage scheme which the Corporation have just taken up for dealing with the drainage of the low-lying parts of Southsea, it is proposed to utilise electricity for the purposes of pumping. The scheme has been reported upon by Sir Frederick Bramwell, who suggests that continuous current should be taken from a battery of accumulators which are available at the electric lighting station.

Clydebank.—The Town Council last week considered whether they should themselves supply electric light in the burgh, or whether they should hand over their rights to the Clyde Valley Electrical Supply Company, who are erecting works at Yoker. It was ultimately resolved to go in for a combined electricity generating station and dust destructor, and so carry out the terms of the order, at an estimated cost of £35,000.

Farnham.—Reporting with regard to the installation of electric calls at firemen's residences at the last meeting of the Joint Fire Brigade Committee, Superintendent Elliott recommended that calls should be fixed at certain residences. The Inland Waterways Company, Limited, have informed the Rural District Council of their intention to apply to the Board of Trade for a provisional order to supply the district with electricity.

Goole.—The Urban District Council have received notification from the electric lighting company of their intention to make application for a provisional order to supply electricity within the Council's area, but the Council have decided that a small deputation shall wait upon the Board of Trade at an early date to put the Council's case before them, and to urge upon the Board the necessity of a definite extension of time being granted to the Council.

Abercarn.—At the District Council meeting last week a letter was read from the Empire Electric Light Company giving notice of their intention to apply for a provisional order to supply the district with electricity, and the matter was relegated to a special meeting of the Council to be held a fortnight hence. A letter from the South Wales Electric Company, giving notice of their intention to lay cables throughout the district, was likewise referred.

Exeter.—The Electric Lighting Committee report that inasmuch as the electric main will have to be carried into the parish of Heavitree at more than one point for the purpose of supplying power to the tramways, it is desirable that negotiations should be opened with the Heavitree Urban District Council with a view to its being ascertained whether arrangements can be made by which Heavitree may be supplied with current for lighting power purposes from the Exeter works.

Dalkeith.—The Council have received from the Board of Trade a description of the system of supply of electrical energy which has been approved by them for the purposes of the Council's order, subject to the regulations for securing the safety of the public and for ensuring a proper and sufficient supply of energy imposed by that department, together with the Board's formal approval of the connection by the undertakers of certain parts of their electrical circuits with earth.

Watford.—The proposed loan for electric lighting purposes has been increased to £1,550. On the 30th inst. the Town Council will discuss a report by the electrical engineer on the proposed extension of the electrical lighting station. The engineer reports that he proposes to put down transformer chambers at the corner of Hatfield and St. Albans roads, and at the corner of Durban and Whippendell roads. These are of the type described and allowed for in his original report.

London County Council.—At the meeting of the London County Council on Tuesday it was agreed to lend the Fulham Borough Council £37,138 for electric lighting purposes. Notices were received of the intention of the following companies to lay mains in their respective areas, subject to the consent of the Council—namely: Blackheath and Greenwich, Brompton and Kensington, County of London and Brush Provincial Electric Lighting, and Metropolitan Electric Supply Company.

Wellington.—In a report of Mr. R. S. Rounthwaite, city engineer and surveyor of the city of Wellington, in New Zealand, for the year ended March 31 last, some interesting information is given with regard to the street-lighting of the city. It seems that incandescent electric lighting of the streets was considerably extended during that period, and that arc lighting is being adopted, though only to a limited extent. These lamps are of 2,000 nominal candle-power, and appear to have given every satisfaction.

St. James's and Pall Mall Electric Light Co.—The directors have declared the following interim dividend for the half-year ended June 30, 1903: at the rate of 7 per cent. per annum on the preference shares, and at the rate of 10 per cent. per annum on the ordinary shares. The amount of electricity sold by the company for the quarter ended midsummer is returned at 1,460,572 units, estimated to produce £23,734, as against 1,420,683 units, which produced £23,678 for the corresponding period of last year.

Wakefield.—The accounts of the Corporation for the year ended March 31 last show that while the total debt on the city at the year end aggregated £1,119,925, the only revenue-producing undertaking was the electricity works. The total receipts were £6,669. 8s. 11d., and the expenditure was £5,721. 3s. 2d., leaving a balance of £948. 5s. 9d. The output during the past year has exceeded that of any previous year, the sale of current, at prices varying from 1d. to 4½d. per unit, having reached 393,315 units.

Burton.—The electrical engineer has reported to his committee that the second attempt of the Patent Regenerative Furnace Company to cure the smoke from the chimney at the electricity works has proved unsuccessful. This time they improved the smoke very much, but at the same time blocked the draught to the flues, and under these circumstances was, of course, useless. He has further reported that he has connected 2,623 8-c.p. lamps to the mains since March 31, making a total of 17,528 8-c.p. lamps connected.

Pudsey.—The Town Council was recommended by the Destructor and Electricity Committee at their last meeting to adopt a joint scheme for a destructor and electric lighting station at an estimated cost of £11,000, of which amount £7,000 had already been passed for an electric lighting station. It was generally felt that a destructor was needed, but some members complained of the lack of details regarding the extra £4,000 for the destructor. It was decided to apply for the extra loan, and to combine the two schemes.

Hackney.—It is proposed to spend £320 on the installation of 40 small arc lamps in Downham-road, Victoria Park-road, and Cazenove-road. A cable is to be laid to the factory of Messrs. A. T. Muratori and Co. for supply to a 2-h.p. motor. The company have agreed to take a minimum supply of energy of a value not less than £25 per annum for two years, and will probably add another 5-h.p. motor if the one at present installed should prove satisfactory. Mains are proposed to be laid in Northfield-road at a cost of £235 for electric lighting.

Chester.—In connection with the proposal to use electricity for pumping purposes at the sewage extension works, the Town Council have resolved that the Sewering Committee be offered the supply of energy required at the rate of ⅝d. per unit for the first 100,000 units per annum, and of ¼d. per unit for all over the first 100,000 units per annum. The Lighting Committee have been authorised to have the distributing main extended along Hough Green-road for supplying

Digitized by Google

energy for public and private lighting at Saltney at an estimated cost of £294.

Dust Destructors.—The Horsfall Destructor Company, Limited, have received from the Sanitary Institute in connection with their health exhibition at Bradford the institute's silver medal (being the highest and only award given for destructors) for one of their patent patent portable refuse destructors exhibited in operation at the exhibition. The firm have recently been successful in obtaining destructor contracts for the Corporations of Leigh (Lancashire), Folkestone, Swansea, Stourbridge, Bridport, Gosport, Bloemfontein, and Durban.

Thornbury.—At the last meeting of the Rural District Council the clerk stated that he had been making preliminary enquiries with regard to the raising of opposition to the proposed application by an electric power company for a provisional order to supply and distribute electricity in the Council's district. He had been strongly advised to recommend the Council to apply to the Board of Trade for a provisional order to supply their own district. The recommendation was agreed to, and it was decided to forward an application to the proper quarter.

Wisbech.—It was decided at the last meeting of the Town Council to apply to the Board of Trade asking them not to revoke the Wisbech electric lighting provisional order obtained in 1901, until Dec. 31, 1904. Communications on the subject of electric lighting within the borough were read from Edmundsons' Electricity Corporation, Limited, Sir Hiram Maxim's Electrical Company Limited, Empire Electric Light and Power Company, Limited, Wisbech and District Electrical Supply Company, all of whom made offers to carry out a scheme for the town.

Highgate Archway.—It has been considered advisable to light Highgate Archway by electricity, in consequence of the danger to the men in lighting and cleaning the present gas lamps. So far as the Islington side is concerned, the question is in abeyance, as at present there is no electric supply as far as the Archway. The Hornsey District Council have decided to light their side of the Archway by electricity. Each of the three lanterns is to be fitted with three incandescent electric lamps, at an annual cost of £18. 13s., or just 13s. more than the cost of the present system of gas lighting.

Mansfield.—Application is to be made to the Local Government Board to borrow £15,000 additional capital for the electric lighting undertaking. The Electric Lighting Committee are prepared to light the public footpath through the Nottingham-road pleasure ground with four 80-c.p. Nernst lamps, including special standards, for the sum of £6 per lamp per annum. The borough electrical engineer and the town clerk have been instructed to report to the next meeting as to the hire-purchase system of motors. It was resolved at the last meeting of the committee that an electrical exhibition be held in the autumn, and a committee was appointed to make the necessary arrangements.

Emsworth.—A long debate took place at the monthly meeting of the District Council in reference to the proposal of the Portsmouth Corporation Telephone Committee to extend their cables to Emsworth. At a previous meeting the Council refused to comply with the request unless furnished with details of the names of subscribers already given in. Now the General Purposes Committee stated that they were satisfied with the particulars supplied, and recommended that the Corporation be permitted to carry out their scheme as far as Emsworth was concerned. This at length was adopted, the poles to be erected to the approval of the surveyor, and the wayleave of 1s. per pole per annum be charged.

Stepney.—The annual report of the electrical department of the Borough Council shows that up to March 31, 1903, £153,291 had been expended on the undertaking, and it is proposed to write off £2,833 of that sum out of the year's profits. There is a gross balance of income over expenditure during the year of £9,400, as compared with £5,210 in the previous year. The total revenue derived from private consumers was £15,126, while the revenue from public lighting was only £2,923, figures which show how popular the system has become with individual consumers, who took over one million units during the 12 months. As to the distribution of the balance, it is proposed to allot £4,438 to the appropriation account for the wiping off of the remainder of the "dead capital" and the formation of a reserve fund.

Penrith.—On a motion favouring certain alterations and improvements at the gasworks coming up for discussion at the last meeting of the Urban District Council, Mr. Seatree said that some time ago, when work was required to be done at the gasworks, it was put off purposely because the work might be modified if electric lighting was decided upon. The latter question had been in abeyance, but could not remain so, as the date for the closing of the order would soon be reached. It had been represented that an electric lighting company might come and take the business if the Council failed to do so, and they should know more as to their position. If they parted with their provisional order it would probably go into the hands of a company of capitalists, who would be prepared to put down money for the purposes of making a profit The matter was deferred.

Beverley.—Apparently the Corporation have no inclination to embark on a scheme for introducing electricity into the borough. Some months ago they obtained an order from the Board of Trade giving them the necessary powers, and initial steps were taken in the way of engaging an expert to prepare plans and estimates. The scheme, however, was practically abandoned. The latest phase of the question is an offer on the part of a private firm to erect the works and run the same for a few years, under certain guaranteed conditions, whereby a responsibility would be thrown upon the Corporation. This did not find favour with the majority of the Council, who have declined to accept the proposals made. As the time allowed by the order obtained from the Board of Trade has nearly lapsed, it remains to be seen if any private company will apply for powers to erect and run the works.

Oban.—The resident engineer has been authorised to convert the gas lamps on Benvoulin-road and on Corriebeg-road as far as Delshangie washing-house into 16-c.p. incandescent electric lamps, and instructed to bring up a report on the cost of converting all the other gas lamps on the line of the mains into incandescent electric lamps or alternatively for the supply of new pillars for incandescent electric lamps, and also to bring up an estimate of the cost of laying a suitable cable for running the lamps in circuits in Breadalbane-street, and to report on the comparative cost of lighting that street by arc and incandescent lamps. The annual rate to be charged against the lighting department for incandescent electric lamps has been fixed at £5. 10s. each for "all night." The resident engineer has submitted a report on the electricity works for the month of June, from which it appears that up to the 30th ult. the equivalent of 3,932 8-c.p. lamps have been applied for, of which 3,178 have been connected.

Derby.—A long report was submitted to the Lighting and Power Committee of the Corporation on Tuesday by Alderman Maxwell, the chairman, and the engineer on the subject of the recent convention of the Incorporated Municipal Electrical Association. In this report these gentlemen speak of the wisdom of the Corporation in becoming members of the association, and sending them as representatives to the convention; and draw attention to the increasing importance of electricity as exemplified at the recent annual meeting. "One thing," the report continues, "above all others for a Corporation to do in managing such an undertaking as ours—which is a new line in our Corporation business—is to place it in charge of the most competent standing committee, the members of which should use all means to keep themselves well informed and up-to-date by studying the principal current electrical papers and otherwise, and we suggest that you should at once become subscribers for the following publications: *Lightning*, *Electrical Engineer*, and *Electrician*."

Bo'ness.—It has been decided to advertise for a consulting engineer to the electric lighting scheme. At their last meeting the Town Council signed the agreement with the National Wiring Company for supplying and fitting up all the necessary plant for electric light and power within the burgh, the provisional order having now been obtained. By the agreement the Town Council finds the capital to equip the works, lay down wires, etc., and pay to the company a premium of 7 per cent. on the cost, while the company pay interest and sinking fund on the Council's loan at 6 per cent. The lease is for 20 years, with breaks at 10, 14, and 17 years. At the end of any of these periods the Council may bring the agreement to a termination, and if the company have made a greater average profit than 3 per cent. per annum during these years the excess has to be paid to the Council, who take over the works without further payment. The maximum prices are to be 5½d. per unit for lighting, 3d. and 2d. for power and heating, and 2½d. for streets and public buildings.

Cardiff.—At a meeting of the Electric Lighting Committee on Tuesday Mr. A. Ellis, borough electrical engineer, presented his report for the month of June last. It set forth that there were now 853 consumers whose premises were connected to the mains, with a total equivalent of 86,390 8-c.p. lamps, against 54,307 in the corresponding period of last year, the total increase being 59 per cent. The total number of units generated at the lighting station during the month was 75,303, and the total supplied from the Roath power station to the Hayes sub-station was 54,640, the combined alternating and direct current units making a total of 129,943. At the same period last year the units equalled 72,484, being an increase of 79 per cent. There was an increased daily output of 77 per cent. The estimated revenue for June was £1,404. 15s. 9d., as compared with £802 7s. 1d. in June, 1902, being an increase of 75 per cent The new electric lamps between Llandaff-road and Clive-road would be in use before the next meeting. The members generally expressed themselves well satisfied with the report.

Hastings.—The borough electrical engineer having called the attention of his committee to the desirability of procuring two additional 20-kw. transformers to be interchangeable with those now in use, and submitted a quotation from the Electric Construction Company, Limited, at £45 each, the quotation has been accepted, and application will be made to the Local Government Board for sanction to the borrowing of the cost (£90). The Electricity Committee have received a report from the borough electrical engineer calling attention to the desirability of providing a spare water feed pump for supplying the boilers at the electric light works, the two existing Worthington pumps which had been installed for a number of years being practically worn out, and submitting an estimate from G. and J. Weir, Limited, of Cathcart, Glasgow, for the supply of one of their standard direct-acting feed pumps, capable of delivering 2,541 gallons per hour at 12 double strokes per minute against a boiler pressure of 185lb. per square inch, for the sum of £88. He estimates the total cost of the pump, including erection and duplicate feed pipe with valves, at £160. Application will be made to the Local Government Board for sanction to the borrowing of this amount.

Walton.—With regard to the clause which the Walton Gas Company desired to get inserted in the Council's electric lighting order, with a view to preventing any deficiency on the working of the undertaking being made good from the rates, the clerk reported at the last meeting of the Council that he had attended before the House of Commons Committee, but had not absolutely obtained the terms which the Council wanted. They did not get the clause postponed for five years, but only for three years. He thought if the committee had taken the Walton application alone on its merits, they would have got a clean Bill, but the Walmesley Council had already agreed to accept the term of three years, which considerably handicapped Walton by being included with them. The Bristol Gas Company also proposed the insertion of the clause at the end of three years, and under these

Digitized by Google

circumstances he did not think that Council's position was altogether unsatisfactory. Communications were received from three companies desirous of supplying Walton with electrical energy, and proposing to apply for provisional orders. The clerk said the application in question could not be successfully made without the consent of the Council, and it was resolved to withhold such consent.

North-Western Electricity and Power Gas Bill.—A Select Committee of the House of Commons, Sir F. Godson in the chair, had this Bill under consideration this week. Mr. Balfour Browne, K.C., described the Bill as promoted with the object of incorporating a company with power to supply electricity and Mond gas within an area of about 2,000 square miles, including Cheshire and portions of Derbyshire, Staffordshire, and Flintshire. Within the area, he said, were works of a very varied character, including collieries, steel and iron works, and salt works and factories of various kinds. Generating stations were proposed at convenient points, and the promoters proposed to supply the power to authorised distributors in the first instance, but not to supply electricity for lighting purposes. The object was to supply power at the cheapest possible rate, and by the use of Mond gas they estimated they could do this four times as cheaply as through production by steam power. Petitions in opposition to the Bill had been presented by local authorities, gas companies, and others within the proposed area. Among these are the Corporations of Hanley, Stockport, Birkenhead, Crewe, Manchester, Stalybridge, Dukinfield, and the Fenton District Council. Mr. Humphreys, engineer, gave evidence in favour of the Bill, and explained the advantages of Mond gas in manufactures.

Cable Rate Reductions.—The full list of changes in the cable rates referred to elsewhere in this issue is as follows: Europe—Bosnia-Herzegovina, from 4d. to 3½d.; Crete, 6½d. to 6d.; Gibraltar, 3½d. to 3d.; Greece, 6½d. to 6d.; Malta, 6d. to 4½d.; Montenegro, 4d. to 3½d.; Portugal, 3½d. to 3d.; Russia, 5½d. to 4½d.; Spain, 3½d. to 3d. Africa—Tangier, from 5d. to 4½d.; Tripoli, 8½d. to 7d. West Coast—Gold Coast—Accra and Sekondi, from 5s. 7d. to 4s. 8d.; other places, 5s. to 4s. 10d. Nigeria—Brass, Bonny, and Lagos, 6s. 3d. to 5s.; other places, 6s. 5d. to 6s. 2d. Sierra Leone—4s. 6d. to 3s. 6d. Asia—British Borneo—Labuan, from 5s. to 3s. 6d.; other places, 5s. 3d. to 3s. 9d.; China and Hong Kong, 5s. 6d. to 4s. 5d.; Corea—Chemulpo, Fusan, and Séoul, *via* Great Northern Company, 6s. 2d. to 4s. 10d.; *via* Eastern Company and Indo-European Company, 7s. 9d. to 5s. 8d.; other places, *via* Great Northern Company, 6s. 6d. to 4s. 10d.; *via* Eastern Company and Indo-European Company, 8s. 1d. to 5s. 11d.; Formosa, 6s. 2d. to 4s. 10d.; Japan, *via* Great Northern Company, 6s. 2d. to 4s. 10d.; *via* Eastern Company and Indo-European Company, 7s. 9d. to 5s. 8d. Philippine Islands—Luzon, 5s. 9d. to 4s. 5d.; other islands, 6s. 2d. to 4s. 10d. The reductions to China, Corea, Formosa, Japan, and the Philippine Islands have already come into force; the others will take effect not later than July 1, 1904.

St. Marylebone.—With a view to obviating any further litigation or arbitration with regard to the purchase of the Metropolitan Electric Supply Company's undertaking by the Borough Council, the price of which has been fixed at £1,212,000, the parties have agreed on a compromise. After the recent action in the High Courts, reported in our issue of the 10th inst., the legal advisers on either side met and suggested an agreement on the following terms: (1) The undertaking to be taken over and money paid on Dec. 31, 1903 (subject to power to apply to court). (2) The capital expended by the company between Jan. 1, 1902, and June 30, 1903, agreed at £67,250, to be paid on Dec. 31, 1903 (subject as above). (3) The amount of £5,000 to which the company are committed to be repaid, if expended, on that date without interest. (4) Profits to be set off against interest on amount awarded until payment of purchase money. (5) Expenditure to be made for future developments as Council approve and to be repaid with interest at 4 per cent. on Dec. 31, 1903 (subject as above). (6) Company to take back motor-generators on July 1, 1906, at £15,000, Borough Council keeping them in good order in the meantime. (7) The Council to repay to the company the cost of severing the St. Marylebone portion of the Norfolk-crescent and St. John's Wood districts, when the Council cease to take their supply for those districts from them. Having considered the above terms, the committee of the Borough Council unanimously recommended the acceptance of the proposed compromise, stipulating that for the requirements of the Council's auditors the Metropolitan Company must be ready to prove that their expenditure down to June 30 has been as stated, and that the company be asked to agree to proceed with the change over from the high-tension to the low-tension system as quickly as the Council's advisers think necessary. This recommendation was fully discussed at the last meeting of the Borough Council, and in the end it was unanimously agreed to accept the compromise.

Scottish Central Electric Power Bill.—An official copy of the agreed clauses and amendments to the Scottish Central Electric Power Bill has been issued. This Bill was opposed by the burghs of Stirling, Falkirk, Alloa, Bo'ness, Grangemouth, Alva, Kilsyth, Denny, and Dunipace, and Stirling Waterworks Commissioners, and the Falkirk and Larbert Water Trustees. The burghs and the water commissioners and trustees have now adjusted clauses, and have received the promoters' undertaking that these clauses will be inserted in the Bill in the first House. Among the protective clauses agreed upon are the following: Should any of the burghs decide at any time to take a supply of electric energy from the company, the company is bound to supply the same to the burgh, taking the supply at the price mentioned in their Bill, and such prices are to include the cost of transforming the energy to such a pressure as the burgh taking the supply may wish. The principal clause for the protection of the burghs is an entirely new clause, and provides that the promoters are not to exercise any of the powers of their Act within the burghs of Stirling, Falkirk, Bo'ness, and Alloa, in order to supply energy which may be used within these burghs without the consent of the local authorities. It is also provided that any extension of the boundaries of these burghs is to be deemed part of the burgh as so extended. It is, moreover, provided that for the purpose of this clause tramways between Bridge of Allan, Stirling, and Bannockburn are to be deemed part of the burgh of Stirling. The company is to have powers to lay their electric mains through the burghs mentioned for the purpose of supplying districts outside those burghs, but subject to certain provisions, as to the Town Councils being empowered to fix the time, the manner, and the position of laying the mains, and also several other provisions as to the protection of property, streets, pipes, etc. It is also provided that should any of of the burghs mentioned apply for an extension of their boundaries, the company is not to have power to oppose the application for extension.

York.—Mr. C. A. Midgley has submitted to the Electric Light Committee his report on the electric light undertaking during the year ended March 31 last—the third year of working. The engineer remarks that the growth of the department has been very remarkable, as the increase in the sales shows. The bulk of the increase, however, is attributable to the increased consumption for power purposes, and the proportionate increase in the revenue, therefore, is not so marked. The demand for power is one which should be fostered, and the great improvement in the cost sheets is chiefly owing to this increased demand in the day time. The total amount of current sold during the year was 652,000 units, being an increase of 229,000 on last year, or 55 per cent. As mentioned above, the most marked feature in the year's working is the sale of current for power purposes. On March 31, 1902, there were 22 motors connected, representing 85 h.p.; the units sold in that year were 63,000 for this purpose. On March 31, 1903, there were 63 motors connected, representing 210 h.p., and the number of units sold in that year was 130,000, being an increase of 106 per cent. In consequence of there being no increase in the public lamps, a feature which is to be deplored, there has been only a small increase in the units sold on the arcs, and in consequence of the reduction in the charges to the Corporation for arc lighting, the revenue from this section has increased very little, being only £219. Some 15 months ago the Streets and Buildings Committee ordered that Fishergate and Fulford were to be lit by some 18 arc lamps, and whilst the cables were being laid the order for arc lighting was countermanded. The cost of this main was approximately £2,000, including new feeder from Walmgate Bar to Fishergate, and the committee are therefore paying in interest and sinking fund for this main some £150 per annum without receiving any income. This fact forms one of the principal reasons for advising that the Fulford pumping station and the new asylum, for which the mains are ample, should be worked from the Corporation supply. The number of consumers has increased from 270 to 386, being an increase of 43 per cent. The maximum load on the station has increased from 410 kw. to 550 kw., being an increase of 35 per cent., the capacity of the plant being 720 kw. To meet the demand the boilers were all working at the same time, and the plant was doing nearly full work. This is a state of affairs which Mr. Midgley trusts the committee will endeavour to alter for the next winter by insisting upon the building contractors completing their contract within the specified time. The capacity of the plant is only 20,000 8-c.p. lamps, and there are some 44,500 8-c.p. lamps connected, and some 2,500 8-c.p. lamps still waiting. The plant in the station has done good work during the past season, and the heavy work has been satisfactorily dealt with by the engineers. The behaviour of the mains has been splendid, as but for one slight stoppage the supply has been continuous. The accounts show that the total capital expenditure on March 31 last amounted to £69,428 The principal items in the balance-sheet are as follows: liabilities—loans, £40,000; sundry creditors (revenue), £613. 4s.; treasurer—owing on capital, £29,428. 1s. 8d.; owing on revenue, £2,386. 13s. 1d.; sinking fund accumulations, £2,401. 12s. 11d.—total, £75,829. 11s. 8d.; assets—expenditure on capital, £69,428. 1s. 8d.; sundry debtors (revenue), £2,477. 18s. 9d.; stores on hand (revenue), £170. 12s. 4d.; sinking fund accumulations, £2,401. 12s. 11d.; deficit balance on reserve fund account, £351. 6s.—total, £74,829. 11s. 8d.

Somerset Electric Power Bill.—This Bill has already received the sanction of the House of Lords. Last week it came before a committee of the House of Commons presided over by Sir F. Godson, K.C., who, after two days' enquiry, found the preamble proved. The area of supply, comprising 381,632 acres, or nearly 600 square miles, includes the whole of Somersetshire, a small portion of Wilts, and a small portion of Gloucestershire, embracing a population of 584,891. The County Councils of Gloucestershire and Wilts, the Corporations of Bath and Well, and the local authorities in the district covered by the scheme did not oppose, and the main issue which the committee had to try was whether or not the city of Bristol ought to be excluded from the operation of the scheme. Counsel stated that the population of Bristol was 339,000, its area was 11,657 acres, and its rateable value was £1,583,000. The principal part of the city was lighted by gas, which was in the hands of a private company; while the electricity, on which a little over half a million had been expended, mainly for the purpose of lighting, was in the hands of the Corporation, who had also begun to supply power. It was believed that an enormous amount of power would be required at the new docks at Avonmouth when completed, and the Somerset District Electric Power Company are anxious to be able to supply power there in the event only of the Corporation being unable to do so. So long as the Corporation were able to do the work themselves, of course the company would not have any power to compete with them. As regarded the industries of Bristol, and, in fact, throughout the whole area of supply, they were extremely numerous and varied, most of them being of a character capable of using power in some form or other. Similar conditions prevailed at Bath, where, as in the case of Bristol, the gas supply was in the hands of a private company and the electricity was in the hands of the Corporation. The

Digitized by Google

share capital of the company was £1,000,000, and it was proposed to construct two generating stations—one a little to the south of Bristol, in a most advantageous position, just on the borders of the coalfield; and the other at Radstock, surrounded by collieries. Counsel then proceeded to quote the Cleveland and Durham case, in which Middlesbrough, Darlington, and Stockton were included against their will, and other cases as precedents for including Bristol within the area of supply subject to certain limitations. Dealing with the case of the Bristol Water Company and the question of the supply of water by them to the promoters for condensing purposes, counsel contended that ample protection was given under the general law. In support of the Bill expert evidence was given by Prof. Frederick Capper, electrical engineer, of the firm of Kirkland and Capper, joint engineers for the scheme along with Messrs. Pressland and Fippard; Mr. A. A. Campbell Swinton, and Mr. Jas. Swinburn. On behalf of the Bristol Corporation expert evidence was given by Sir William Preece, consulting engineer, and Mr. Proctor, electrical engineer, to the Corporation. After consultation, the committee found the preamble of the Bill proved. The chairman announced that the committee were of opinion that the Bristol Corporation should be protected against undue interference, undercutting of prices, and anything like undue preference to one customer over another with regard to rates. The company must not come in and charge absurd prices. The committee thought that some official of the Board of Trade should come before them and help them to carry out these views on the clauses.

Wolverhampton.—The annual report of the Lighting Committee to the Council, for the year ended March 31 last, states that on the year's working a working profit was made of £11,697. 11s. 4d. =9·07 per cent. on the capital expenditure. Out of this amount the following charges have to be met: interest, £3,659. 4s. 7d. =2·84 per cent. on capital; sinking fund, £3,956. 4s. 5d. = 3·07 per cent. expenditure; cost of change-over of system, £637. 8s. 4d. = ·49 per cent. averaged during year; loss on sale of old engines, £965. 9s. 10d. = ·75 per cent.—a total of £9,218. 7s. 2d. =7·15 per cent.; balance being net profit for the year, £2,479. 4s. 2d. =1·92 per cent. The committee are of the opinion that this result of the past year's working is satisfactory in all respects, and indicates that the undertaking is in a sound financial condition. Special attention is directed to the manner in which the committee have dealt with the question of the sale of the old engines, and a table is given showing the dates of purchase of the engines, the original cost, the amount written off for sinking fund, the sale price, and the balance to be met out of revenue. It is seen from this that the debt of £2,929 in respect of these engines is absolutely extinguished, and consequently the department will in future be relieved from the payment of £168 annually in respect of interest and sinking fund on this amount of capital. The change-over of the system of supply is now completed, and consequently the revenue of the undertaking will not in future be burdened by further charges in this respect. The change-over of the system of supply and the rewiring of consumers' premises was commenced in October, 1899, and has been gradually proceeding until its completion in March, 1903. The total cost of this work has been £2,500. 8s. 3d., the whole of which has been paid out of the revenue of the undertaking. During the year the output of electrical energy to private consumers for motive power has increased by 160 per cent., and the committee have every reason to believe that this rate of increase will be proportionately maintained. Owing to the fact that during the first four months of the financial year only a portion of the tramway routes were in operation and comparatively few cars running, the total output of electricity for tramway purposes has not been quite so large as was anticipated, but, nevertheless, the additional day load which it has occasioned has proved of considerable benefit to the undertaking. It is confidently anticipated that the output will be considerably larger during the present year, and that proportionately better results will be obtained. A table is given illustrating the continued growth of the undertaking, and although a considerable percentage of the total increase in units sold is in respect of electrical energy supplied to the Tramways Committee, yet it is seen that the percentage increase in units sold to private consumers is also of a satisfactory character. The figures for the past two years are respectively as follows: Number of consumers, 545, 655; percentage increase, 18·2 per cent., 20·2 per cent. Number of lamps connected, 40,953, 54,578; percentage increase, 23·1 per cent., 30·5 per cent. Number of units sold, 746,318, 1,624,639; percentage increase, 17 8 per cent., 117 per cent. The greater proportion of the capital expenditure during the financial year has been in respect of mains, the committee having adopted the policy of extending the distributing mains in all directions where there was any prospect of adequate revenue being obtained, and they are confident that, although the capital expenditure so incurred will not be remunerative for the next two or three years, it will ultimately lead to the securing of considerable additional revenue from a profitable class of consumers.

PROVISIONAL PATENTS, 1903.

JULY 13.

15469. **The self-acting adjusting fork for the trolleys of electric tramcars, or other vehicles or engines to which it may be applicable.** Charles Gandy, 24, Lynnwood-avenue, Newcastle-on-Tyne.

15479. **Improvements in regulating systems of electric distribution.** Philip Middleton Justice, 55, Chancery-lane, London. (The National Battery Company, United States.) (Complete specification.)

15481. **Improvements in electric arc lamps.** Egidio R. Viale, 55, Chancery-lane, London. (Complete specification.)

15489. **Improvements in regulating systems of electric distribution.** Philip Middleton Justice, 55, Chancery-lane, London. (The National Battery Company, United States. (Complete specification.)

15494. **Improvements relating to electric insulating material.** Isaac Shimwell McDougall, 18, Southampton-buildings, Chancery-lane, London.

15495. **Improvements relating to electric insulating fabrics.** Isaac Shimwell McDougall, 18, Southampton-buildings, Chancery-lane, London.

15500. **Improvements in alternating-current contact apparatus.** The Aktiengesellschaft Brown, Boveri, und Co., 46, Lincoln's-inn-fields, London. (Date applied for under Patents Act, 1901, November 13, 1902, being date of application in Switzerland.) (Complete specification.)

15509. **Improvements in armatures for electric induction motors.** William Phillips Thompson, 322, High Holborn, London. (Electricitäts-Gesellschaft Alioth, Switzerland.) (Complete specification.)

JULY 14.

15532. **Improvements in dynamo suspension gear for use in connection with electric lighting systems for railway carriages and the like.** The Electric and Ordnance Accessories Company, Limited, and Robert Frederick Hall, 24, Temple-row, Birmingham. (Complete specification.)

15552. **Improvements in apparatus or devices for transmitting and receiving messages by wireless telegraphy.** Charles Goodwin Burke, 51, Deansgate-arcade, Manchester. (Complete specification.)

15562. **Improvements in telephone exchange systems.** William Aitken, Edge-lane, Liverpool.

15581. **Improvements in means for preventing arcing between commutator brushes.** Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

15592. **Improvements in synchronising alternators.** Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

15595. **Improvements in an electric arc lamp-hanger and cut-out.** Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

15599. **Improvements relating to the production of alternating currents.** Valdemar Poulsen, 45, Southampton-buildings, Chancery-lane, London.

15600. **Improvements relating to voltaic batteries.** James William Gladstone, 45, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Dec. 17, 1902, being date of application in United States.) (Complete specification.)

15605. **Improvement in and connected with the wiring of overhead conductors for electric traction systems at terminal stations and the like.** William Herbert Turner and William Herbert Isherwood, 322, High Holborn, London.

15623. **Improvements in means for protecting the exposed or live parts of electric switches, cut-outs, or the like.** William McDevitt, 18, Southampton-buildings, Chancery-lane, London. (Complete specification.)

JULY 15.

15636. **New electric contact breakers for sounding alarms when doors and windows are opened.** David Smith Semple, Calside-avenue, Paisley.

15647. **Improvement in insulated frogs or crossings or the like for overhead trolley wires as used on electric railways.** Henry Brecknell, Edward May Munro, and Hugh Innes Rogers, Thrissell-street, Bristol.

15662. **Improvements in and connected with wireless signalling.** Louis Heathcote Walter, 7, Victoria-street, Southport.

15682. **Improvements relating to electricity meters.** Emil Blumenthal and Siegfried Schlesinger, 45, Southampton-buildings, Chancery-lane, London.

15684. **An improvement in portable electric meters.** Francis Arthur Darton, 142, St. John's-street, Clerkenwell, London.

15700. **Improved process for reducing organic substances in an electrolytic bath.** Oliver Imray, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Farbwerke vormals Meister, Lucius, und Brüning, Germany.)

15687A/02. **A new or improved electric post, being a method of and means for the collection, transmission, and distribution of letters, parcels, and the like.** Roberto Taeggi Piscicelli, 24, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Rule 9, Aug. 25, 1902.) (Complete specification.)

JULY 16.

15746. **Improvements in electrical arc lamps.** Guest, Keen, and Nettlefolds, Limited, and William Edward Symons, 7, Staple-inn, London.

15772. **Improvements in and relating to the magnetic separation of ore.** William Kennedy-Laurie Dickson, 18, Southampton-buildings, Chancery-lane, London.

JULY 17.

15787. **Improvements in detectors of electrical oscillations.** Louis Heathcote Walter, 7, Victoria-street, Southport.

Digitized by Google

15793. A new or improved device for the quick repair of broken trolley wires of electric tramways. Thomas Henry Webb, 96, Buchanan-street, Glasgow.

15796. An improved clockwork or rotary register to be used with or adjusted to any style of electric or gas meters for timing, registering, measuring, etc., electric or gas energy or current. Charles Davis and Charles George Lawless, 165, Barton-road, Stretford, Manchester.

15810. Improvements in electrical fusible cut-outs. Charles Mark Dorman, Reginald Arthur Smith, and Herbert George Baggs, Ordsal Electric Works, Salford. (Complete specification.)

15811. Improvements in dynamo-electric machines for regulating the charge and discharge of storage batteries used in conjunction with train generators. The Lancashire Dynamo and Motor Company, Limited, and Robert Stafford McLeod, 34, Castle-street, Liverpool.

15817. Improvements in and relating to electrically-actuated musical instruments. William Kennedy-Laurie Dickson, 18, Southampton-buildings, Chancery-lane, London.

15821. A magnetic balance or magnetometer and galvanometer. Walter Hibbert, 101, Goldhurst-terrace, South Hampstead, London.

15831. Improvements in apparatus for use in welding railway rail joints by electricity. Henry Frederick Anton Kleinschmidt, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

15838. Improvements in fusible electric cut-outs. Killingworth William Hedges, 8, Quality-court, Chancery-lane, London.

15869. Improvements in elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

15870. Improvements in and relating to elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

15871. Improvements in and relating to elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. Charles Gordon Curtis, United States.)

15872. Improvements in elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

15873. Improvements in rotary compressors, blowers, and pumps. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

15874. Improvements in elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

15876. Improvements in elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

JULY 18.

15911. An improved method of interlocking electric lamps to their couplings. Charles A. Shanks, 12, Lorn-road, Brixton, London.

15940. Improvements in and relating to electric lamps for testing purposes. Frederick Joseph Gordon, 1, Queen Victoria-street, London.

15944. Improvements in elastic fluid turbines. The British-Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States).

COMPLETE SPECIFICATIONS ACCEPTED.

To be published August 6, 1903.

NOTES.

Electric Tramcar Brakes.—At a recent trial at Havre of the new Westinghouse brakes, a tramcar, weighing complete nine tons, was stopped under 11 yards when travelling at a speed of 20 miles per hour. The rails were dry at the time, but the test shows excellent control over a very heavy vehicle.

Eton College Fire-Alarms.—One result of the recent fire at Eton College is that the Urban District Council is about to equip a complete electric fire-alarm system througout the town. All the houses in each college will be put into electrical communication with the fire station. This is obviously the right thing, and it may prevent an even more disastrous fire than the last one.

Large Incandescent Lamps.—At the Sunderland convention of the Incorporated Municipal Electrical Association, Mr. J. W. Swan held out hopes of great improvements in the efficiency of the carbon-filament lamp, especially in the larger sizes. We now hear that a lamp made in Chicago is said to have an efficiency of 1·9 watts per candle for the 25-c.p. and 55-c.p. sizes. Naturally, the light obtained is an exceedingly white one, but no information has reached us as to the life and average watts per candle-power during that life. From the illustrations it would appear that the lamps have large globes which would tend to keep down the blackening.

Consulting Engineers.—Elsewhere in this issue will be found a notice which will be of great interest to consulting engineers in Westminster. It is that a small town in Scotland is thinking of having electric light, and is prepared to receive tenders from consulting engineers for advising them as to what to do and the best way of doing it. Full particulars of the applicant's career are to be given, but we are afraid that the modesty of some of our best men will prevent them from applying. We cannot congratulate the authorities of the above town on their ideas of the best way to select a professional man.

Depreciation.—The question of depreciation, like the poor, is always with us, and we are not surprised to find that Huddersfield is in the throes of correspondence on the subject. If any critic of a corporation department wishes to find fault with it, he has only to exercise a liberal view of what it should allow for depreciation to draw the conclusion that it is losing money rapidly. Thus, the Corporation tramways at Huddersfield are said to have lost £1,700 in the last quarter. The simple fact is that on the last quarter's working there was a credit balance of £1,200 after all expenses and the interest and sinking fund on the capital had been paid. The fictitious deficit above mentioned is arrived at by assuming that some £2,900 should be written off during the quarter for depreciation.

Sprague Multiple-Unit System.—Mr. Frank J. Sprague has been awarded the Elliot Cresson Medal by the committee on science and art of the Franklin Institute in respect of his multiple-unit system of electric traction. The main features of the system, which represents an important advance in the operation of electric railways, have already been described in these columns. Briefly, the object of the invention is to permit the operation of electric trains made up of any number of units, and to enable the train to be rapidly accelerated and maintain the maximum tractive effort on the wheels. This is accomplished by making each unit a motorcar and attaching a controlling cable to all controllers, so as to enable the various units to be combined in a train and operated by a single controller at each end of the train.

Wireless Telegraphy.—Dr. Blockmann, of Kiel, has been experimenting with lenses made of resin, paraffin, glass, and other materials of high dielectric constants with a view of controlling Hertzian wave propagations to definite directions. He claims to have succeeded fairly well at moderate distances, and, if this is so, there is more chance of wireless telegraphy being of real service at sea during a fog. With such an apparatus a ship could ascertain by wireless telegraphy the direction in which the signalling station lies, which is not the case at present Another item of information concerning wireless telegraphy was elicited in the House of Commons the other night. It was to the effect that all battleships and a large number of cruisers in our navy have now wireless telegraphy equipments. The average expenditure on the system is about £20,000 per annum, a good part of which goes to the Marconi Company. The service is likely to be greatly extended in the future.

Unhappy St. Marylebone.—Yesterday afternoon the Council of the metropolitan borough of St. Marylebone had to consider the report of their Electric Lighting Committee, in which it was stated that the St. Marylebone Electric Supply Company intended to apply to the Board of Trade in December for a provisional order authorising them to supply electricity within the borough. The Council will, of course, adopt their committee's recommendation to oppose the granting of this new proviaional order. We have little doubt that their opposition will be successful, but, on the other hand, the new company will be able to make out an exceedingly strong case in favour of competition. It will not only be able to urge the hackneyed plea of inefficient municipal control, but also that the St. Marylebone Council have grossly over-capitalised their undertaking to the disadvantage of the consumers within the area. In fact, they could make out a stronger case against the Council from a consumer's point of view than was made out when a competing order was issued for the city of London.

Kew Magnetic Observatory.—The Kew authorities have now decided to remove the whole of their magnetic instruments for the absolute determination of the earth's magnetic field to a new site on the farm of Nether Cassock, in the parish of Eskdalemuir, Dumfriesshire. A description of this site, which has been obtained from the Duke of Buccleuch, makes one desire to be one of the Kew officials. In the words of our informant, "it is far from the maddening crowd, situated on a slope, with a view of apparently endless hills." It is far from railways, tramways, ironworks, and even iron ore, and would seem to be an ideal spot for the recording of the vagaries of the earth's magnetic field, the causes of which are yet to be thoroughly explained. Surely it is right that this change in location of the Kew instruments should be made, rather than that, as was once suggested, the whole of the population round Kew should be debarred from having an economical system of electric tramways. We wish Dr. Cree every success in the erection and equipment of this new national observatory.

Electric Cable Truck.—An electric automobile truck for handling telephone cables has been recently put to work in New York by the telephone company. It is designed to serve two purposes. The first is the transportation of the heavy drums of cable which are required for the underground service. After these drums have been hauled to the position in which they are required, the electric motor on the automobile is then used for drawing the cable into the conduits. When doing such work a device is attached to the front of the truck, which device projects down into the manhole and forms a rigid support

Digitized by Google

for the pulleys over which the hauling cable runs. The speed of hauling can be varied from 10ft. to 40ft. per minute. The actual weight of the automobile complete is 4¼ tons, the accumulators alone weighing 1¼ tons. The guarantee given with this vehicle is that it should carry a load of five tons for 15 miles on one battery charge, and haul in the cables so transported. The range would be 25 miles if the cable had to be transported only. The vehicle is said to be doing excellent work.

All Space Full of "Juice."—According to the *Electrical World*, advices from Denver, Colo., state that a representative of the Whitney Electric Development Company is there to arrange for transporting a 13in. cannon to the summit of Pike's Peak or some lofty pass in the mountains to prove the theory of Mr. Whitney, of Chicago, that by penetrating the atmosphere surrounding the earth he can secure from the electrical sea above unlimited current for earthly power plants. Mr. Whitney, when he secures and locates his monster gun, will fire a spherical iron magnet vertically. To this projectile will be attached a coil of wire 20 or 30 miles in length. Mr. Whitney believes that, once beyond the pale of the law of gravitation, the magnet will be drawn into the electric sea, the wire will hold it, and by attaching larger wires he can draw from above limitless electric power. It will be a great pity if this theory is not allowed to demonstrate its insanity—or its soundness. It is further stated that a private test of the Whitney electric ladder has been made on a small scale in New Mexico and that it was successful, incandescent lamps being lighted by the electricity brought down from the electrical ether. The object of securing a mountain peak in Colorado for further operations is that the mountain tops there are all attained with comparative ease, and the atmospheric conditions at the altitudes reached are such that men can stay there continuously, if necessary, without any serious effects.

Frictional Trains.—A whole column of one of our esteemed daily papers is given to a remarkable American invention which is to transport, or which might transport, people from London to Glasgow in two hours. The inventor of the system is Prof. Albert C. Albertson, who hails from the University of Copenhagen. The great feature of the system is that the train is to be lifted by a magnetic suspension in such a way that nearly the whole of the weight is removed from the rails. The inventor proposes to use accumulators for giving this magnetic lift, and he must be a happy man to have such faith in accumulators. He also appears to have exceedingly hopeful ideas as to the grading of his high-speed tracks and of the acceleration which he can obtain from a locomotive which has practically no adhesion on the rails. We would suggest to Prof. Albertson that if he were to provide a vacuum in a tunnel or housing for the railway, he could still further increase his speeds by reducing air friction. The most remarkable thing about the notice of the invention is that there are editors of responsible daily papers in this country who will print such utter rubbish. Also, we should at least have expected a professor of the Copenhagen University to know something about eddy-current losses caused by moving magnetic fields.

Official Salaries.—At the recent meeting of the Incorporated Municipal Electrical Association, the president, Mr. J. F. C. Snell, touched on the vexed question of remuneration. He rightly pointed out that a frequent change in staff was by no means conducive to good work. The reason too often for these frequent changes is that a man in a responsible position, in charge of a corporation undertaking, finds that the work he is doing is not appreciated by the corporation; or, we would say, the work is appreciated, but the corporation will not recognise the same by increasing his salary as his responsibilities increase. In consequence, a new position is sought in which a higher remuneration is attached, and the town who refused a moderate increase in salary lose a man who was thoroughly conversant not only with their undertaking, but also with the best way in which it should be developed. The new man who comes in at the old salary or less is likely to make alterations which involve a considerable waste, because he does not rightly understand the views of his predecessor. It is, therefore, clearly to the advantage of corporations to keep men in their employ when they have proved that they are capable organisers and reliable advisers as to new departures. A case in point is that of Leeds, where the tramway manager has been given a considerable increase in order to keep him in charge of the tramway department. As is only to be expected, this increase has caused a great outcry in the town from men incapable of recognising the true facts of the case. We trust that the Corporation will not be moved by this outcry, but will adhere to the money-saving policy they have adopted. It will be noticed that Leeds is more progressive than London in this respect.

Electric Lifts.—The working of lifts by electricity is or is not advisable from a central-station point of view according to the nature of the rest of the load. If the works from which they are to be supplied have a good motor load, there is no doubt that the addition of lifts will offer no great objection from the regulation of voltage point of view. We know of one town, however, which has a supply on the single-phase alternate-current system in which the supply of an electric lift was the cause of endless trouble. The lift was worked very seldom, and the bill for the whole year did not pay the interest charges on the cost of the supply main, etc. When, however, the lift was started through the day the induction drop most seriously affected the pressure on adjacent lamps, as it made a large proportionate increase in the load on the small plant at work. It further became a great question as to whether the Council were obliged to supply the consumer, whose load was such that it involved the running of a large machine all day in order to prevent it from interfering with other consumers. A similar case occurred recently at Poplar over the County Council lifts at the end of Greenwich Tunnel. Here the lifts are exceptionally heavy, and when starting cause considerable fluctuations in the supply pressure. Due to this, the Poplar Borough Council have allowed the work to be taken over by the London Electric Supply Company, who have yet to learn what the effect will be on their system. We notice from the County Council agenda that the Bridges Committee have undertaken to supply motor-generators, switchboards, and high-tension feeders through the tunnel, and to pay from 1½d. to 2d. per unit for the power supplied. The highest charge of 2d. per unit is to be reduced to 1·8d. on condition that the lifts are not worked on Sundays. Thus a most intermittent load has been taken on at factory rates.

Trolley Insulator Specifications.—At the last meeting of the American Institution of Electrical Engineers, Prof. Samuel Sheldon and Mr. John D. Keiley read a paper entitled "Some Recommendations Concerning Electrical and Mechanical Specifications of Trolley Insulators." After a series of tests, the authors recommended the following specifications for such insulators: All samples tested shall break in the eye. The average ultimate tensile strength of all samples subjected to mechanical test shall not be less than A pounds, and no individual sample shall show a tensile strength of less than 85 per cent. of the average tensile strength of all the samples that are tested.

Digitized by Google

The average breakdown voltage, for samples which have been broken in the eye in the mechanical test, shall not be less than B volts, and no individual sample shall break down at less than 90 per cent. of B volts. As to the values to be specified for ultimate tensile strength and breakdown voltage, the following are suggested where high-class insulators for use on 500-volt lines are to be specified:

	Ultimate tensile strength in lbs.	Breakdown voltage.
2½in. globes	6,000	7,000
3in. globes	9,000	10,000
Small Brooklyns	9,000	10,000
Large Brooklyns	18,000	10,000

Owing to the comparatively low softening temperature of the insulating materials generally used, and to the close proximity of the working conductor when in service, it is important that specifications for round-top hangers should impose a test for softening temperature, and the following is suggested: Round-top hangers when suspended free from draught in an inverted position by means of a bronze ear weighing 8oz., and being 5½in. long, the ear clamping the middle of a round rod of soft iron ¼in. in diameter, and of at least 20in. length between connectors, must be able, without breaking down or becoming permanently deformed by more than $\frac{1}{16}$in., to sustain a weight of 200lb. from the cap for one hour, a current of 200 amperes being passed continuously through the iron rod, the rod being cold at the start.

Magnetic Manganese Alloys.—At a recent meeting of the German Physical Society, Berlin, Mr. Fr. Hensler made an interesting communication on magnetic manganese alloys. Both pure manganese and copper-manganese are known to be quite non-magnetic, but the author has found certain other alloys of the metal to exhibit strongly magnetic properties. The following metals and metalloids will thus give more or less magnetisable manganese alloys, free from iron:

Tin.	Antimonium.
Aluminium.	Bismuth.
Arsenic.	Boron.

The most interesting results are derived from a thorough investigation into the behaviour of manganese-copper-aluminium alloys. As commercial copper-manganese always includes small quantities of iron, it was first ascertained that even a copper-manganese to which material amounts of iron were added, was not magnetisable. It was next shown that, with equal percentages of manganese, the susceptibility will increase for increasing percentages of aluminium up to a maximum corresponding to equal atomic amounts of both metals. This fact is the more noteworthy as the researches of Wiedemann, Quisicke, Du Bois, and others have shown aqueous manganese salt solutions to possess a magnetic susceptibility somewhat higher than the corresponding ferric salt solutions. There is a striking analogy in both the salts and certain alloys of the non-magnetic manganese metal showing strongly ferro-magnetic properties. This suggests a possible comparison of the manganese-aluminium bronzes with a salt solution where the copper would play the part of solvent; the above combination of equal atomic amounts of manganese and aluminium having to be considered as solved salt. Keeping manganese-aluminium-copper alloys for some time at a temperature of 110deg. C. will reduce them to a state of stable equilibrium, corresponding with a maximum susceptibility. The transition points beyond which these alloys become non-magnetic are relatively low, a gradual rise being, however, noted with increasing amounts of either manganese or aluminium. As adding other metals will strongly lower the position of the transition points, the latter may be varied at will within an interval ranging from 60deg. to 310deg. C.

Electricity for Small Hospitals.—At the recent meeting of the Sanitary Institute Mr. W. Noble Twelvetrees read an interesting paper on the above subject, in which he gave full consideration to the actual cost of supplying hospitals with electrical energy. He comes to the conclusion that in most towns it is more economical for hospitals to have their own plant than to take supply from the public mains. This, we think, is borne out in practice, as the majority of hospitals are so equipped. Owing to the fact that they are obliged to have a certain amount of steam for various purposes, the cost of supervision in electric lighting is not so heavy as it otherwise would be. In a typical example of a small installation in which the first cost for plant was only £675, the author estimates that the average cost per Board of Trade unit for electric lighting only will be 3·37d., out of which 1·20d. is for interest and repayment of capital. If the same installation supplied motors, the cost would come down to 1·49d., owing to the much larger output. In the next part of the paper some interesting statistics are given to show the relative vitiation of the air by various illuminants. The author's conclusions given at the end of the paper are as follows: (1) that electrical energy can be generated in a hospital of moderate size, even under unfavourable conditions, at a cost considerably lower than the average rate charged by public supply corporations; (2) that economical production is greatly aided by utilisation of the generating plant for power as well as for light; (3) that under favourable conditions energy can be generated at such cost that electric lighting becomes less costly than direct gas lighting when ordinary burners are employed, although more costly than gas lighting by incandescent burners, and more costly than direct lighting by oil lamps; (4) that, in view of its deleterious effect upon the atmosphere, the combustion of gas and oil for the direct lighting of hospitals is distinctly inadvisable, and that these substances may be more advantageously employed in the provision of motive power; (5) that the facilities offered by modern gas and oil engines are such as to place electricity within the reach of all hospitals, for which the outlay upon generating plant has hitherto been regarded as unjustifiably heavy.

L.C.C. Capital Expenditure.—From this week's agenda it appears that the Finance Committee of the London County Council is trying to close a firm hand on the purse strings against the demands of the various other committees of the Council for further expenditure. There is a certain amount of humour in these internal disagreements between the committees of this large London authority. For instance, the Finance Committee has agreed to pass forward the capital expenditure in connection with the tunnel under the Thames at Rotherhithe, on which £1,340,000 is to be spent. It explains that this money will not be all spent at once, but will take seven years for the Bridges Committee to get through the money. This argument, however, did not succeed in the case of the rebuilding of the Lambeth Bridge, and, in spite of the wishes of the Bridges Committee, the chairman of the Finance Committee is to move an amendment to the effect that this work should be deferred. In this amendment he is to express the opinion of the Finance Committee that the rebuilding of the Lambeth Bridge is one of those schemes, which although desirable in itself, the Council could without grave inconvenience postpone until some of its present commitments have been cleared off. It is well, in our opinion, that the Finance Committee should in this way try to keep down expenditure which is bound

Digitized by Google

to affect the cost of carrying on business in London. We do not, however, envy it its task. Another point which this committee has had to deal with recently is that of the St. Marylebone electric lighting undertaking. It will be remembered that in June last the Council refused the application from the metropolitan borough of St. Marylebone for a loan of £1,274,000 for the purchase of the electric lighting undertaking within its area. It has now been decided that if the Corporation of St. Marylebone obtains an electric lighting license from the Board of Trade the loan can be granted for seven years. This period of seven years will then be altered to a longer period after the undertaking has been paid for and an electric lighting provisional order obtained. We were under the impression that the Board of Trade had decided to issue no more electric lighting licenses, but perhaps they will for this once do so to assist both Councils out of the difficulty in which they are placed.

Cathode Rays as Wave Indicators.—At the recent convention of the American Institute of Electrical Engineers, Prof. Ryan read a paper on an alternate-current wave indicator which works with cathode rays. For the following abstract of this paper we are indebted to the *Electrical World*. The author displaces the oscillating of light in an oscillograph by a cathode beam impinging on a fluorescent screen, and caused to oscillate by the magnetic influence of coils supported close to the walls of the tube and traversed by the alternating current. The cathode beam is spread out into a band, similar to the galvanometer band. Similarly the cathode beam may be analysed optically by a revolving mirror. Prof. Ryan prefers, however, to dispense with the revolving mirror, and employ a known perpendicular component of motion to obtain a cyclically re-entering closed curve of light, or, in fact, an indicator diagram. The engine indicator diagram combines a cyclically varying component of motion of excursion proportional to the instantaneous steam pressure in the cylinder, with a perpendicular motion obtained from the piston. In Prof. Ryan's apparatus the perpendicular component is not a uniform to-and-fro movement, but a simple harmonic movement, or pendulous movement. This is obtained by using another pair of coils magnetically acting upon the cathode beam perpendicularly to the first pair, and exciting these with an alternating current from which the harmonics have been practically all weeded out by the aid of resonance. It is the same sort of diagram as would be obtained from the steam-engine cylinder if the horizontal component of motion were a simple harmonic motion, or were taken from an eccentric driven by the uniformly rotating engine shaft. The cathode-ray diagram may be photographed. It has then to be expanded horizontally to reduce the simple harmonic motion to corresponding uniform motion. This may be done either with the aid of specially prepared ruled paper, in which the spacing of abscissæ follows the inverse of the simple harmonic law, or the same result may be obtained by a method of projections described in the paper. It is curious to observe that no such reduction of the diagram to uniform motion would be needed if the base component of alternating current were adjusted to the simple triangular or saw-tooth form, instead of to the simple harmonic form. The instrument has the advantage that the cathode rays are practically inertialess, and thus respond fully and immediately to fluctuations in the current strength. On the other hand, it takes several seconds of exposure and cyclic repetition to secure a photographic record. The instrument is remarkable as requiring double excitation—namely, first, by high-pressure or Wimshurst machine, with a cathode ray-producing current of about half a milliampere; and, second, by the base component of simple harmonic current of about one ampere. While the oscillograph has the advantage over the apparatus of Prof. Ryan in giving a direct trace of a wave, which trace can be observed continuously, the latter admits of adjustment whereby a detail of a wave which it is desired to study may be exaggerated.

Separation of Dynamo Losses.—Whereas out of the losses by friction observed with electrical machines the brush friction, especially after the more general introduction of carbon brushes, has been duly considered, the friction of the air and of the bearing journals is, as a rule, accounted for together, presuming that the former is only a few per cent. of the aggregate friction. This, however, as shown by Dr. L. Finsi in an article recently published in the *Elektrotechnische Zeitschrift*, is not generally true. In modern engines a special point is made of securing good cooling; both the speed of air and the amount of air carried along are, therefore, increased as much as possible, the cooling surface being augmented by means of convenient ventilating slots and conduits. Rotating poles of high-speed alternating-current machines and the front connections of rotating armatures will, moreover, act as ventilating vanes, the efficiency of the machine being highly increased. As, however, at the same time the losses by ventilation are materially augmented, the friction of air reaching and exceeding the amount of the remaining losses, the latter will be worthy of special consideration, a separation of the losses by friction thus becoming desirable. The friction of the brushes may be immediately calculated as the difference of the determinations both with and without brushes of the losses by friction, all the remaining conditions being equal. The author accordingly terms "total friction" the sum of the friction of the air and of the bearing journals, the brush friction being deducted from the aggregate amount. A means of separating the air from the journal friction is afforded by their different behaviour with regard to the temperature, of the journals. Whereas the effect of the friction of the latter in the case of sliding journals, and of temperature ranging from 15deg. to 80deg. C. may be taken as inversely proportional to the temperature, t, of the journals (in centigrade degrees), the effect of the friction of the air is of necessity independent of the latter. The total loss by friction, R (deducting the effect of brush friction), may accordingly be represented by an expression of the form

$$R_t = a + \frac{b}{t} \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

Measuring the total loss at two different temperatures will therefore enable the two constants a and b to be determined by means of the equation. Having measured the total friction with the speed and at different temperatures, this straight line will be obtained by taking the reciprocal values of the temperature as abscissæ and plotting the corresponding values of the total friction as ordinates A simpler method consists in presuming the resistance o air to be proportional to the square of the speed, and the coefficient of friction to be proportional to the square root of the latter, when the total friction will be given by

$$R_n = c\,n^3 + C\,n^{1.5} \quad . \quad . \quad . \quad . \quad . \quad (2)$$

where n is the number of revolutions of the machine, c and C two constants, the first term again corresponding to the air friction, the second to the friction of the journals. Measuring for two values of n, the corresponding values of the total friction will allow of calculating the coefficients c and C. These methods are of no greater scientific value than the hypotheses they are based upon. Being empirical as the latter, no mathematical accuracy is claimed for

Digitized by Google

them; as, however, they control one another, they will enable the practician to arrive at a reliable gauge of the amount of both losses separately.

Utilisation of Energy in Wireless Telegraphy.—This was the subject of a paper by G. Ferrié recently read before the Paris Academy of Science. As the energy utilised in wireless telegraphy transmissions with Tesla transformers depends on the capacities inserted in the exciter circuit and on their discharging potential, it is advisable to give the antennæ a large surface, so that tuning is possible with an exciting circuit including high capacities. If, however, induction coils be used, a certain limiting value of the capacities should not be surpassed, as the working of the coil might otherwise be endangered; the antenna will accordingly have to be kept within certain limiting dimensions. As, on the other hand, the discharging potential is nearly inversely proportional to the capacity, the energy utilised will be practically constant. In this case the capacities of the existing circuit should be chosen so as to allow of the antenna being tuned with only three or four turns of the Tesla secondary. It is, however, possible to use several induction coils with the same antenna, connecting them either to one or to different Tesla coils, the secondary circuits of which are connected in parallel or in series to the antenna. Using commercial transformers will afford the advantage of enabling very large capacities (utilising high amounts of energy) to be employed in the exciting circuit, as the discharging potential within certain limits augments along with the capacity, owing to the resonance phenomena exhibited by the instrument. If, however, given antennæ are to be used, it is not possible to increase very much these capacities, as syntony has to be effected between the antenna and the exciting circuit, the discharging potential being limited. The amount of energy which can be utilised with this arrangement is, therefore, limited as well. Marconi has avoided this drawback by using first the total amount of energy available to produce oscillations of any period in a first circuit including as high capacities as possible, these oscillations being next raised to a rather high tension by means of a Tesla coil, by which another chosen capacity will be charged so that the period of its discharge may be tuned with the antenna by means of another Tesla transformer. The author has found it more suitable to divide all the capacities liable to be charged by a commercial transformer into two or more groups, inserted in different oscillating circuits, but connected to the same oscillator. All these circuits, regulated so as to give rise to oscillations of equal periods, will act on the antenna by means of an equal number of Tesla coils, the secondary circuits of which are connected either in parallel or in series to the antenna. Tuning is effected with the help of the readings of a hot-wire ammeter by acting in the same way on the secondaries if these be connected in parallel, or on one of them if they be in series. As the vibratory motion imparted to the antenna has a period equal to that of each of the exciting circuits, the energy available may be better utilised, while using only the desired wave length. As regards the most suitable form of antennæ, numerous experiments have shown that transmissions would be the more efficient as the ammeters gave higher readings. As, on the other hand, the intensity of the stationary wave will decrease from the ground to the top, it is advisable to secure to this intensity a high value at the greatest possible height of the antenna. Antennæ of great height are, therefore, from this point of view as well, particularly advantageous, though their upper part is in reality of little value. It is possible also to use disymmetric antennæ arranged so that their upper part represents the greater part of the quarter of a wave given by the whole of the antennæ, a considerable intensity being thus obtained over a great part of the height of the antennæ. As to the intensities indicated by the hot-wire ammeters, the author calculates, for an antenna 35m. in length and a reading of two amperes taken at a distance of 1m. from the ground, the mean efficient intensity of each of the oscillations is about 100 amperes.

M.E.A. Parliamentary Committee's Report.—We have now received copies of this report, of which only a brief abstract was given in the report last week of the annual meeting of the Incorporated Municipal Electrical Association. The full report is interesting reading, and shows that the committee is moving in the right direction. For instance, it has taken up the question of the value of electrical undertakings by the rating authority, and by quoting statistics from a number of towns is likely to get the matter placed on a more equitable basis. The committee has appointed the president of the association and Alderman Smith, M.P., of Barrow-in-Furness, to represent them and to give evidence before the Royal Commission on Municipal Trading. The remarks of the committee on the Board of Trade's Electric Lighting Act, 1903, are to the point, and it is explained that in certain respects the Act will operate against municipal electrical enterprise. In one clause the Bill is to be highly recommended; it is the one which reads "a person shall not be entitled to demand a supply for any premises having a separate supply, unless he has agreed to pay such annual sum as will give a reasonable return on the capital expenditure and will cover all standing charges to meet the possible maximum demand." A full history is given of the opposition which the Willesden District Council has had to meet from the local gas company, which was successful in obtaining what is known as the Bermondsey clause. This was inserted in the following slightly modified form: "The Council shall, once in every year after the first year's working of the electric lighting undertaking, cause to be laid before them a statement and balance-sheet of the accounts of the electric lighting undertaking, drawn up in accordance with the form of accounts prescribed by the Board of Trade for a local authority under the Electric Lighting Acts, 1882 and 1888, and the Council shall thereupon fix annually the charges to be made for the supply of electrical energy in the then ensuing year at such rates (not exceeding the maximum rates specified in the order of 1898) so that so far as is reasonably practicable the revenue for that year should not be less than the estimated amount of the expenditure and of the charges for interest and sinking fund for that year." The gas company also endeavoured to prevent the Willesden authority from carrying out free wiring, but the opposition was unsuccessful, as the *locus standi* on this matter was not allowed. The Council also asked for the following clause: "The Council may refuse to supply electrical energy to any person whose payments for the supply of electrical energy or for the hire or sale of any lamp, motor, electric line, fitting, motor, apparatus, or thing let or sold in pursuance of this part of this Act, are for the time being in arrear, whether any such payments be due to the Council in respect of a supply to the premises in respect of which such supply is demanded or in respect of other premises"; but the examiner deleted the words "or for the hire or sale of any lamp, motor, electric line, fitting, motor, apparatus, or thing let or sold in pursuance of this part of this Act," although the clause as it stood was allowed only last year. Application to suspend the repayment of the money for the first few years was struck out by Lord Morley.

CHELSEA GENERATING STATION.

The following is an outline description of the Chelsea generating station now being constructed by the Underground Electric Railways Company of London, Limited.

The capacity of the building at normal load is 57,000 kw. On this basis the cubic feet per kilowatt (including office building) is 139, and the square feet per kilowatt is 1·36. The steel frame of the building will be closed in with brick and terra-cotta; the roof and most of the floors will be concrete. In general details the building will be

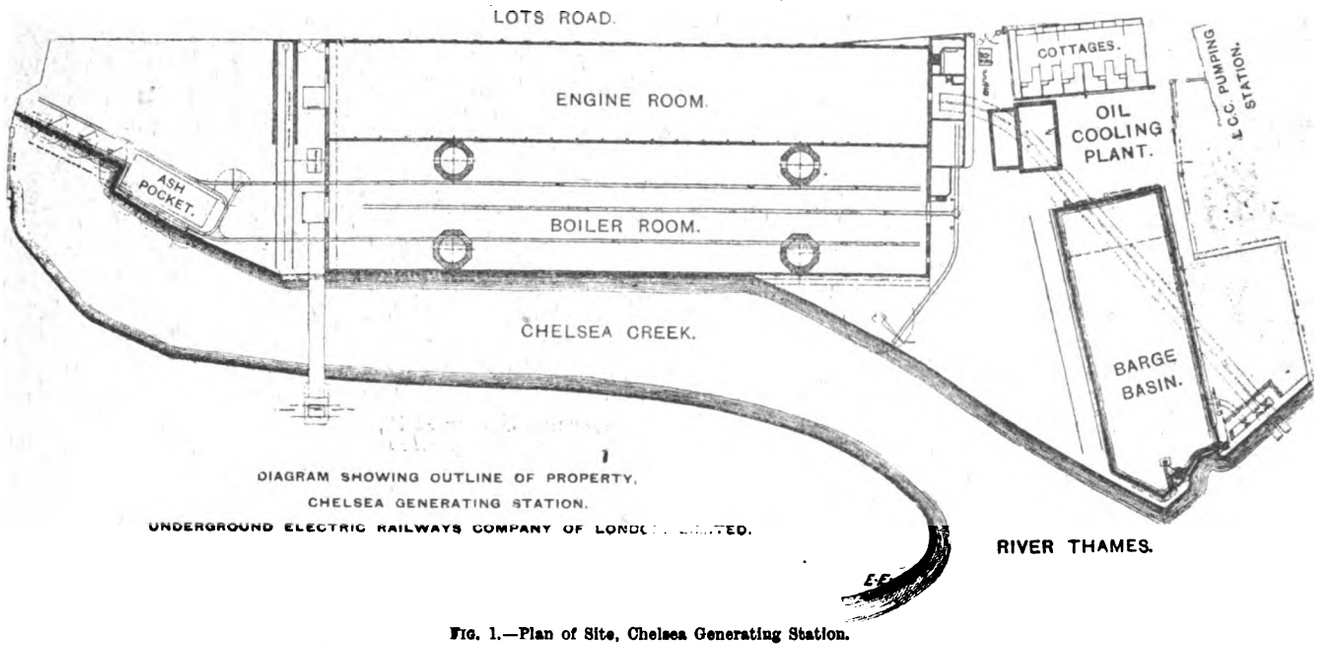

FIG. 1.—Plan of Site, Chelsea Generating Station.

The site (Fig. 1) comprises 3·67 acres of land with a water frontage on the Thames and on Chelsea Creek of 1,100ft., and a frontage on Lots-road, Chelsea, of 824ft. The building (Fig. 2) is 453·5ft. by 175ft., and 140ft. in height from the ground floor to the peak of the roof. The office building adjoining on the east measures 81ft by 25ft., and will have three floors, the lower of which considered as a factory for the production of a commodity, and there will be no ornamental features.

The south side of the building will contain 80 water-tube boilers arranged two storeys high, and carried directly on the steel frame of the building (see Fig. 4). Each boiler has 5,212 square feet of heating surface and 672 square feet of superheating surface. The boilers will

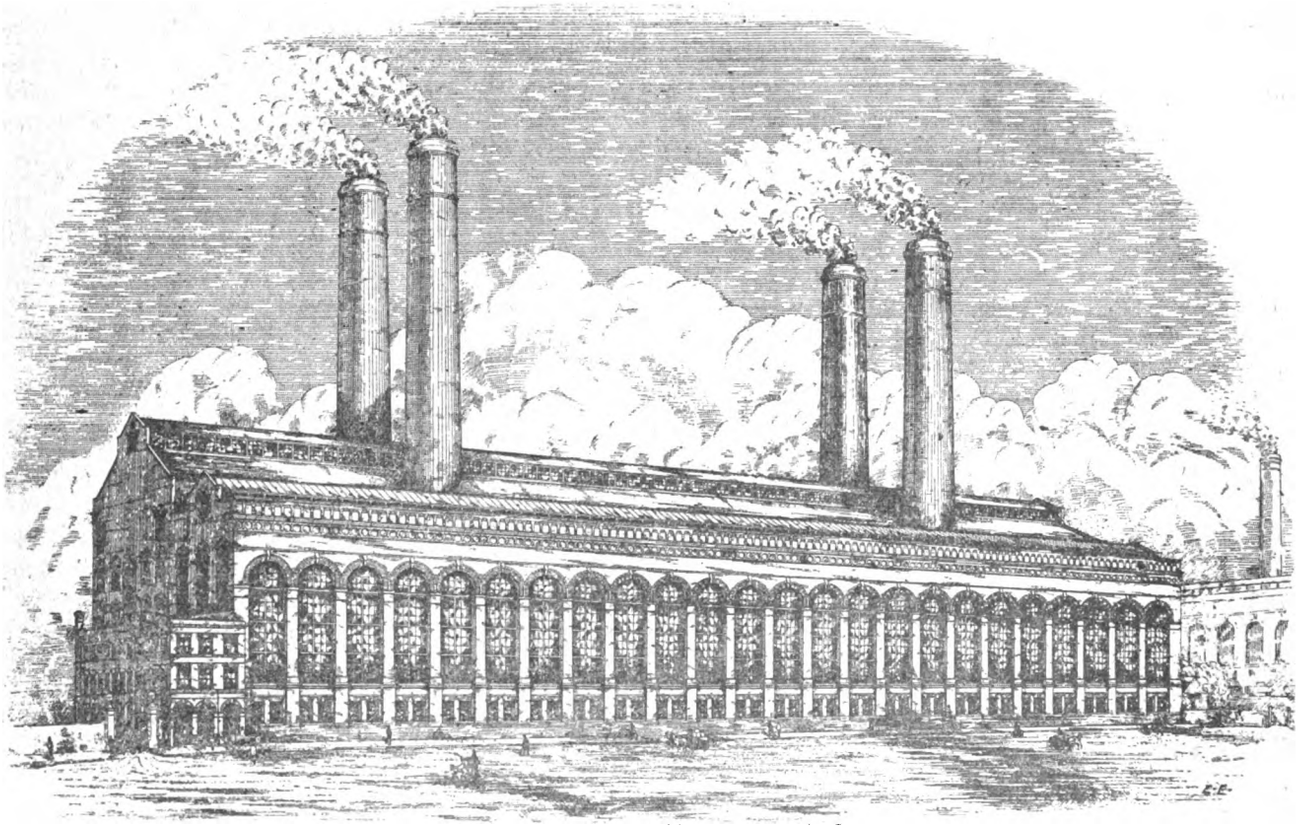

FIG. 2.—Lot's Road Elevation, Chelsea Generating Station.

forms the machine shops. The main building will have a self-supporting steel frame weighing about 5,800 tons. There will be four chimneys, each 19ft. internal diameter and 275ft. high. The foundations for these chimneys are 42ft. square and 34ft. 6in. below the ground-floor level. There are 2,200 cubic yards of concrete in each foundation.

be piped in groups of eight, each group supplying the steam for one electric generating set and one feed pump, there being no steam connections between the several groups, except that a supplemental header at the east end of the building is connected to two groups. This header supplies the exciter engines, air compressors, house pump,

Digitized by Google

etc. Chain-grate stokers under each boiler have 83 square feet of surface. Economisers, with tubes 10ft. long and 1,540 square feet of heating surface is provided for each boiler.

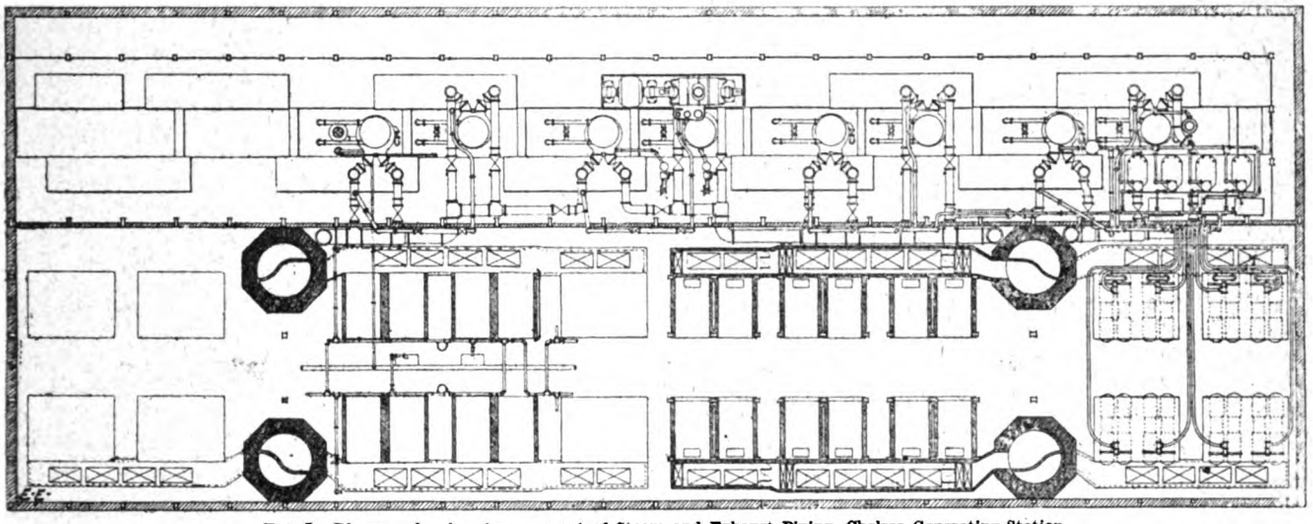

FIG. 3.—Diagram showing Arrangement of Steam and Exhaust Piping, Chelsea Generating Station.

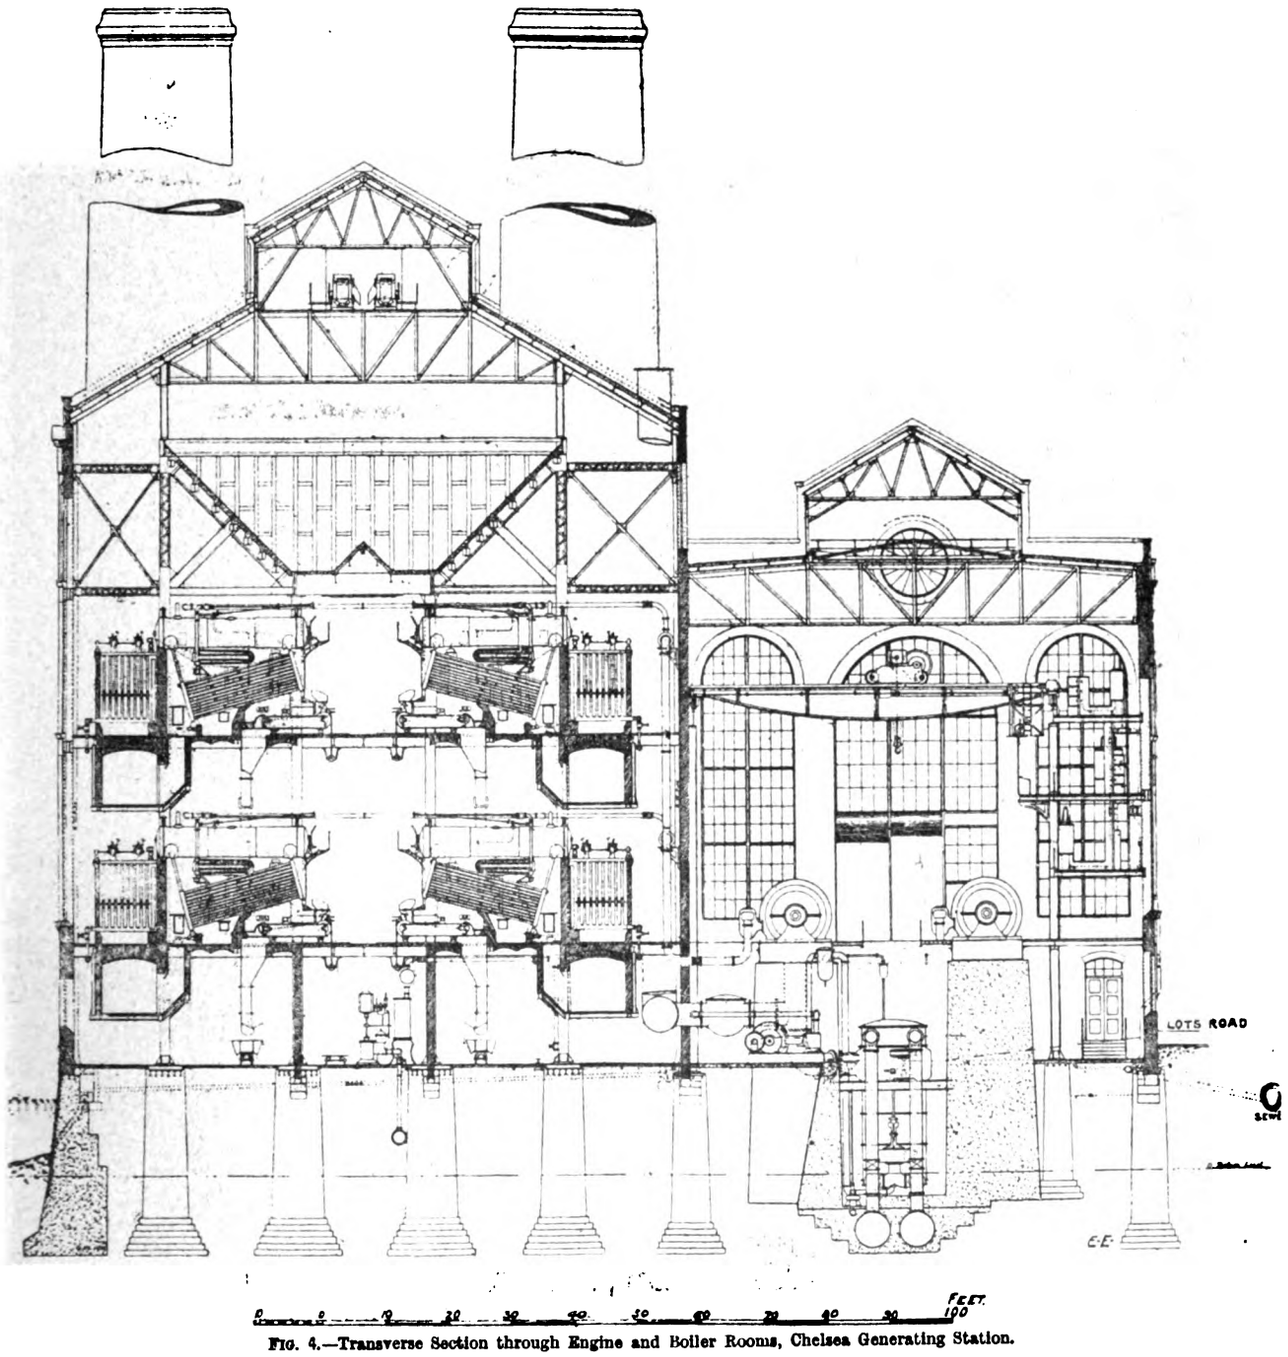

FIG. 4.—Transverse Section through Engine and Boiler Rooms, Chelsea Generating Station.

placed wider apart than the usual practice, are grouped behind the boilers, with the customary by-pass flues; Boiler feeders are placed on the ground floor and supply ring mains on both the boiler-room floors.

Digitized by Google

The main generating sets each consist of a horizontal turbine engine running at 1,000 revolutions per minute, and a three-phase generator wound for 11,000 volts 33⅓ cycles; there will be 10 such sets, with floor space for one of half the size. The normal rating of each generator is 5,500 kw., but they will carry an overload of 50 per cent. for two hours at practically the same steam consumption per kilowatt-hour. There will be four 125-kw. 125-volt steam-driven exciter sets, running at 375 revolutions per minute.

The condensing system consists of vertical condensers, each with 15,000 square feet of cooling surface. These are located in pits between the engine foundations. The circulating water is supplied by 66in. pipes laid to the edges of the channel of the Thames. Each condenser has a 20in. centrifugal pump. The duty of this pump is simply to overcome the friction of the pipes, as the system is arranged on the siphonic principle, the top of the condensers being within 29ft. of minimum low tide, and the circuit is closed. The intake and discharge mains are arranged for reversible flow. The condensers are designed to work on the dry vacuum principle, the air-pump and the water-pump being separate. All the condenser pumps are electrically driven.

The switchboard is carried on three gallery floors extending across the north side of the engine-room with returns across the east end. All high-tension switches will be motor-operated, and the feeder system extending to the 23 sub-stations will be in duplicate. A line of 64 ducts is being constructed to carry these feeders to the nearest point on the District Railway at Earl's Court.

Coal will be received on lighters in a tidal basin at the east end of the station, or by rail at an unloading point of the West London Extension Railway on the opposite side of Chelsea Creek. For unloading barge coal the basin is spanned by two travelling cranes, each working a one-ton grab; the coal is weighed in the tower at one end of each of these cranes and dropped on to a belt conveyor, thence by duplicate inclined elevators 140ft. high to the top of the building. Rail coal will be taken from a hopper under the coal wagons by an inclined elevator to the top of the building at the opposite end. The distribution over the bunkers is by duplicate belt conveyors so arranged that the direction of travel of both belts can be reversed so as to handle coal coming in at either end. The storage capacity of the bunkers is 15,000 tons. The daily consumption will reach 800 tons, and six of the largest river barges can be placed in the basin at each tide. Ashes will be removed by an industrial railway worked by a storage battery locomotive; two lines of rails will be laid under the ash hoppers on the ground floor. The ashes will drop into self dumping buckets to be unloaded into barges by pneumatic hoists on the dock wall at the west end of the premises, or stored in an adjoining bin if no barge is available. The capstans, barge basin gate mechanism, and many of the large valves in the building will be worked by pneumatic motors. The electric motors on the travelling cranes over the engines, as well as those on the oil switches, will be direct-current, 125 volts. All other motors will be three-phase, 220 volts; most of the lighting will be on the latter circuit.

It is expected that a portion of the plant will be in working order by the latter part of 1904.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE.

(Concluded from page 80.)

We have already reported the first day's proceedings in connection with the above conference, which was held in Glasgow on July 8, 9, and 10 last. Previous to the conference being resumed on the second day, the association held their business meeting. The vice-president, Mr. C. R. Bellamy, general manager of the Liverpool Corporation tramways, who was unfortunately unable to attend the meeting owing to business engagements elsewhere, was elected president in succession to Mr. Young, Mr. Alfred Baker, chief officer of the London County Council tramways, being appointed to succeed Mr. Bellamy as vice-president. The further business consisted in the election of six new members to the Executive Committee, as follows: Councillor Walter Paton, Glasgow; Councillor Boyle, Manchester; and Councillor Smithson, Leeds, representing corporations; and Mr. C. J. Spencer, general manager of the Bradford Corporation tramways; Mr. P. Fisher, manager of the Dundee Corporation tramways; and Mr. H. England, general manager of the Sunderland Corporation tramways, as representing tramway managers. It was decided to hold next year's conference in Liverpool.

The conference having been resumed, Mr. C. J. Spencer (Bradford) read a paper in which he briefly compared tramway conditions in America and Great Britain. This paper we reproduce—with the exception of some minor deductions—in the author's own words:

Tramway Conditions in America and Great Britain Compared.

BY CHRIS J. SPENCER.

I was in the States and Canada in the latter part of April and the early part of May, 1902, and whilst there visited the cities of New York, Pittsburg, Cleveland, Buffalo, Boston, and Philadelphia, and Toronto and Montreal in Canada, so that the impressions gathered of American and Canadian practice were from the above-mentioned places. My British comparison was the state of affairs in Bradford, a city in the West Riding of Yorkshire, with a municipal tramway system of about 230 cars, serving a population of 281,000 (each of whom had a different opinion on tramway administration), scattered over an area of 22,800 acres of very hilly ground, so that the lines in Bradford present, in addition to traffic problems, engineering difficulties.

Fares.—I found that in the majority of cities the fare problem as we know it in England did not exist. We all, no doubt, have met the man who requires a stage 100 yards or so further along the route, nearer a point where he happens to live—not, of course, because it would in any benefit himself, but for the welfare of the city. On the other side of the Atlantic the universal five-cent fare does away with the stage system. I believe that to this universal fare system the Americans owe a great measure of their success. We all know that tramways are achieving a great social reform in this country—that the health and happiness of the community is being directly benefited by the removal of the crowded population from the restricted area of the centre to the broad acres of the suburb. To achieve this, cheap long-distance fares have to exist. Unfortunately, in England, the penny seems to be the only universal fare that can be considered, and, as most systems depend upon the receipts from the short-distance passenger, it is often found that traffic returns will not allow more than about two miles for this fare. The possibilities of the nimble penny are certainly wonderful, but they are limited. Compare this with the American (2½d.) fare. We must remember that the receipts from the short-distance passengers are 150 per cent. higher than we obtain in England. Not many tramway committees would, I venture to suggest, consider very long what to do did they know that their passengers would be willing to pay 2½d. where they now pay 1d. for short distances, on consideration that all stages be abolished. True, wages and perhaps some other expenses are higher in the States than here, but not by any means are they *pro rata* with the fares. Apart altogether from the outcry of the public, an increase in the minimum fare on British tramways would not pay. Englishmen will walk short distances rather than pay even 1d. (Scotchmen, I am informed, are much worse), not so the American; he realises that time is money, and that the expenditure of a five-cent fare is small compared with the saving of time. I have heard it suggested that the street railway companies always manage to have the streets in a state that makes walking nearly a craze for the bold and brave. I have, however, no evidence to offer on that point, and do not desire to commit myself. We are, it is said, being Americanised, and perhaps even the American universal

Digitized by Google

fare will yet come as a boon and blessing, and a balm for all our sorrows in respect to fares.

Fare Collecting.—Everything in America appears to be standardised, and the system of fare collecting is no exception to the general rule. No conceivable system could be simpler. The conductor receives his five cents, and registers the fact on the clock-face indicator by pulling the indicator cord running the full length of the car. The check, I was informed, is the fear of the unknown passenger, who can easily see if any roguery is taking place. Should a man be reported by a "spotter" for sharp practice, his chances for further employment as a car conductor for the company by which he was employed, or any other, are remote. His photograph is sent round to each line, along with the cause of his dismissal. On the face of it this system seems good, and should be very effective, though one is inclined to think that the amount of power in the hands of the spotter is a trifle excessive. Yet, I regret to state, I saw three or four distinct cases of fraud on street cars. In two cases my own fare was taken by the conductor, who failed to register it. I had the pleasure of discussing the matter with a street railway manager, who admitted freely the weaknesses of the system. I naturally asked if the bell punch and tickets had been tried, and he replied, "Yes, but I guess it takes too much gilt off the nickel." I also asked if they had tried a locked fare box, similar to what we use in Bradford and those I had seen in Montreal and Toronto. His reply was, "Yes; and that would have been all right, but our passengers thought the conductor was carrying a spittoon, and used it for that purpose." Fare-collecting systems are determined by the conditions that determine fares, so that a simple system similar to the American is only possible where fares are simple also.

Traffic Catering.—So far as the frequency of service, etc., is concerned, I saw nothing different to the usual practice in this country; the service run on any particular section is determined by the earnings per car mile. Americans are, perhaps, as may almost be expected, just a little more enterprising in this direction than the average tramway manager here. For example, in one city visited I noticed on a traffic return sheet that a certain section was earning not more than six or seven cents (3d. or 3½d.) per car mile, and that a fairly good service was being run. Upon enquiry, I found that this particular section had been laid for the purpose of developing an estate (which I presumed was owned by the Street Railway Company). At Cleveland a line had been laid from that city to a small lake-side pleasure resort, chiefly noted for drinking and consequent rowdyism. I was astonished and pleased to hear that the result of this line had been to quite reform the place. Car-loads of temperance reformers, etc. (I do not know whether the company supply these), had been dumped down, and had had due effect. I was especially pleased to note this, for our experience in Bradford, I am sorry to say, has been the opposite. Instead of sending loads of temperance reformers to our previously quiet suburbs, car-loads of quite a different kind of human being ride out of the city on Sunday afternoons in quest of the advantages to be obtained by the three-mile limit.

Pleasure Traffic and Advertising.—Our traction friends of the States quite appreciate the effect of good pleasure attraction at the outside terminus of a line. In many places I found street railway companies owning and running pleasure parks, etc., and advertising with due modesty the wonderful beauty and suitability for pleasure purposes. In these matters we certainly have something to learn. I believe that many lines which are at present non-paying could be improved by a little judicious expenditure in the direction just mentioned.

Speeds.—To mention speeds to a British tramway man is almost like waving a red rag to a bull. It is unnecessary to state that speed limits in America are very different from what obtains at this side of the "pond." Though they are fixed by the various cities in which the street railway companies operate their lines, yet it seems to be recognised that the speed per hour allowed is the average schedule speed, and not the maximum attained between any two given points. On the other hand, cars do not travel in the busy streets of the cities much quicker than they do here. I heard it stated, for example, that the average speed, including stops, was 10 miles per hour on Broadway, New York. I tested this one morning when I was in a hurry, but if the average speed exceeded three miles per hour on that occasion I am very much surprised; so I found that the American tramway manager can no more perform miracles than his English brother. Much, however, is made of quick acceleration, and a good average speed is obtained more by this means than by running at the high maximum rate. The controlling pointer is shifted from the zero position to full speed in an incredibly short space of time, and it is as well that American passengers have become accustomed to it. I am afraid that did we in Bradford commence to accelerate our cars at such a rate as, say, in New York, the number of nervous ladies clinging to stout old gentlemen, who in turn would be compelled to sit down hurriedly on the laps of other ladies, would be appalling, and cause quite a public uproar. We have, however, something to learn with regard to acceleration, and I do not think its benefits have yet been fairly recognised in England. In Bradford I have for 13 months been gradually increasing the acceleration, with a result that my average speed has increased from about 5½ to 6¾ miles per hour on all sections, the current consumption falling from 1·6 to 1·4 units per car mile. The passengers can be educated to the quick start, and its benefits are far reaching. True, the wear and tear on the equipment is increased, but, to use a trite Americanism, "it pays." We have been successful in Bradford in getting increased speed, and our maximum, previously eight, is now twelve miles per hour. We have had this granted—so say the Board of Trade—due to our good conduct, and it is held out that some time in the dim future (if our conduct is still good) that on certain quiet country roads we may be allowed to run as high as 16 miles per hour. I am afraid that by the time our conduct has attained such perfection nature will have provided for us wings, and new legislation for aerial navigation will be required.

Outward Appearances.—In outward appearance the average American system does not strike an Englishman favourably. The overhead equipment is generally put up roughly, cheap, and nasty. The cars are far from clean, and the track in many instances bad. Neither can the average conductor be complimented on his civility. I must say that my remarks do not apply to all the systems I saw. Several are the very opposite, and rank, I should say, among the smartest and best tramway organisations of the world. After dealing with merely outside appearances, one must acknowledge that the facilities which the tramways give the public in the way of rapid transit from one point to another, with frequent quick services, are excellent. In no case did I see a slower service than a five minutes', and in the busy parts of the cities there was a continuous stream of cars going in both directions. In fact, everyone seemed to be riding and no one walking. I am told that the American cannot afford to walk—he has not time. Trams are therefore to him not a luxury, but a necessity.

Overhead Equipment and Permanent Way.—I saw nothing in the overhead department very different from our standard practice here. I was very much interested in the different systems of permanent-way construction, the electric-welded joints in Buffalo and cast-welded joints in other cities visited providing interesting matter for British consideration. As this subject, however, is being dealt with in another paper before the conference, it is unnecessary for me to go into further detail.

Rolling-Stock.—On the question of design, upkeep, and care of cars, I found that matters stood pretty much the same as they are here. Engineers have different ideas, and work differently. In some cities I found the engineer advocated a regular overhaul of the equipment. At others it was considered good policy to allow the motors, etc., to run until they showed distinct signs that, unless an immediate overhaul was made, a breakdown would occur. At Cleveland, Ohio, I found a system of inspection of equipments that I considered very good, and have since adopted the principle at Bradford with excellent results. Motors, controllers, etc., are examined daily whilst the cars are in service at some convenient

Digitized by Google

terminus. It thus becomes unnecessary to employ a large staff of night men for inspection on small work repairs. The motor inspector notes any defect which is developing, and orders the car to remain at the repairing depôt; he is better able to find and hear of the little faults in the daytime and during service hours. This, to my mind, seems better than either of the extremes—viz., waiting for breakdowns to know that something is wrong, or incurring heavy expenses by a regular and periodic overhaul. I found many useful practical hints, especially in the workshop and car-repairing department. As the majority of the workshops that I visited were originally built for other purposes, I did not find that the buildings themselves were very well adapted for the work for which they were employed. I found, however, all sorts of little plans of overcoming what might be termed natural difficulties, and a great number of labour-saving devices in the way of machinery employed to bring down the cost of running. In all the workshops I came across a compressed-air plant was in operation, which was used for various purposes—cars were swept out, motors cleaned, and building surfaces cleaned by air jets. Pneumatic tools—drills, chisels, hammers, lifts, etc.—in successful operation, connected to the compressed-air main, laid in the shop. We have, since my visit, adopted a compressed-air plant in our own repairing shops, with corresponding benefits.

General.—I fail to see that we are behind America in this country with regard to tramway matters, and whilst we may learn much from our friends across the Atlantic, yet, in some things, I feel that the Americans would equally benefit by a visit to this small island.

With the discussion which followed the above paper the business of the conference practically terminated. In the afternoon visits were paid to the Pinkston power station, car works, etc., and at night, commencing at seven o'clock, the association's dinner was held.

The third day was devoted to a pleasure excursion to Inveraray per the turbine steamer "King Edward,' and thus ended a most enjoyable meeting.

MUNICIPAL ELECTRICAL ASSOCIATION.

After the discussion on Alderman Pearson's paper had been completed at Middlesbrough on Friday, the 17th, the following paper was taken as read :

Some Observations on Electricity Supply and Methods of Stimulating Demand.

BY COUNCILLOR J. E. PANTON, M.D. (MEMBER OF COUNCIL), CHAIRMAN OF THE BOLTON ELECTRICITY COMMITTEE.

About 25 years ago the writer spent one summer evening on the Thames Embankment waiting for the twilight, when the electric arc lamps (the old Jablochkoff candle) would become illuminated, so that he could, for the first time in his life, see the effect of the "new" light, and, about five years later, while passing daily to and fro along Holborn Viaduct, he watched with considerable interest the process of installing incandescent electric lamps in the various business establishments along that route, and also in the gas lanterns for street-lighting. At that time, and for some years later, electric lighting was an expensive luxury, with current at from 10d. to 1s. per Board of Trade unit, and incandescent lamps at 5s. each. The light also had a tendency to be erratic, and had a nasty way of going out, without previous notice to the consumer, and of remaining for a longer or shorter period (mostly longer) in that deplorable state of uselessness. Even now, in these twentieth-century days we have our breakdowns, but we are getting somewhat nearer the ideal in reliability of supply, and, in all probability, greater improvements will be made in the future than have been in the past. In 1882 electric supply companies were booming, and during that one year over 12½ millions sterling of British capital was invested in such supply companies. But there was a rude awakening for investors, and in the following year only two millions was so invested; in 1884 half a million, and in 1885 but £58,000. In 1886 the tide commenced to turn, and investors' capital again flowed into electricity supply. This condition of affairs has continued, with more or less regularity, up to the present time. To-day electric supply undertakings in this country represent 45 millions sterling, of which municipal supply works can claim slightly the larger share, so that it is quite evident this industry has come to stay.

Some enthusiasts would adopt electric lighting whatever the charge per unit might be. If, however, we are to increase materially the demand for electric energy, we must be able to claim that our price (*qua* price) is as low per candle-power-hour as any other illuminant. At the same time we may claim, for the users, the added advantages of cleanliness, convenience, healthiness, absence of noxious fumes which damage pictures, wall and ceiling papers, curtains and tapestry

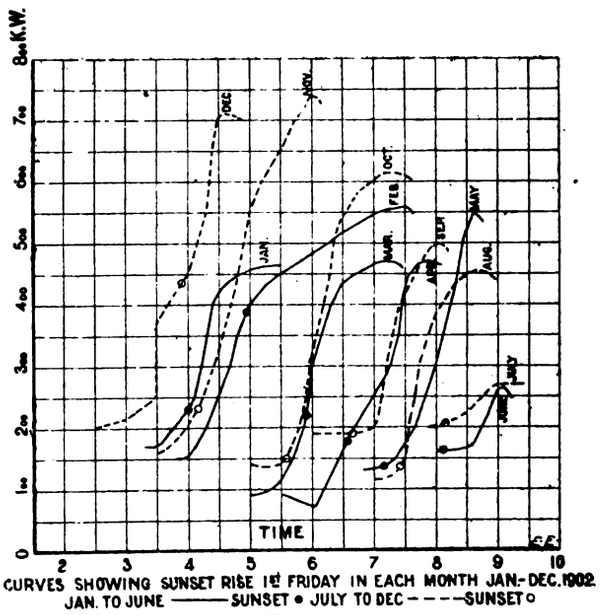
FIG. 1.

work, and corrode metal work, such as picture chains, thus endangering the stability of heavy pictures, etc. Similarly with motive power. No very great progress will be made until it is demonstrated that, commercially, it is cheaper to drive by electricity than by any other means. For both lighting and power purposes the confidence of consumers must be obtained as to the continuity and reliability of such supply. It is also necessary that the public should have confidence in the financial stability of supply undertakings, so that they may have reasonable expectations of retaining, for such number of years as they may need it, a continuous supply night and day,



CURVES SHOWING SUNSET RISE 1ST FRIDAY IN EACH MONTH JAN-DEC. 1902.
JAN. TO JUNE ——— SUNSET • JULY TO DEC - - - SUNSET o

FIG. 2.

Sunday and weekday, at the same price per unit, or at a lower price than that which induced them to embark on electric lighting or driving.

In the opinion of the author nothing is so calculated to dispel the confidence of consumers as a constant fear of breakdowns, and a price which has a tendency to fluctuate up and down. To increase the demand we must diminish the price, and to diminish the price we must increase our economics in production and learn the most economical manner in which electric energy can be produced and distributed. For a purely private lighting supply the load factor obtainable, except in the

Digitized by Google

Metropolis or very large cities, will rarely be above 10 per cent., but for a station solely supplying motive power the load factor would probably be 30 to 35 per cent. In the first case the whole of the standing charges would fall on the lighting consumer, and in the second case on the power consumer. But if we combine the two undertakings in one, the standing charges (including interest, etc., on mains) would be divided, and both classes of consumers would benefit. This combination of loads would not give such a good load factor as the purely motive power station, but the writer thinks a load factor of 25 per cent. may be obtained in any supply station if the units sold for purposes other than lighting or tramway traction represent 75 per cent. of the total sold for all purposes. In such a station, although the load factor would be lower than in the purely motive power works, the earning capacity or commercial efficiency would be greater, on account of the plant being employed during the

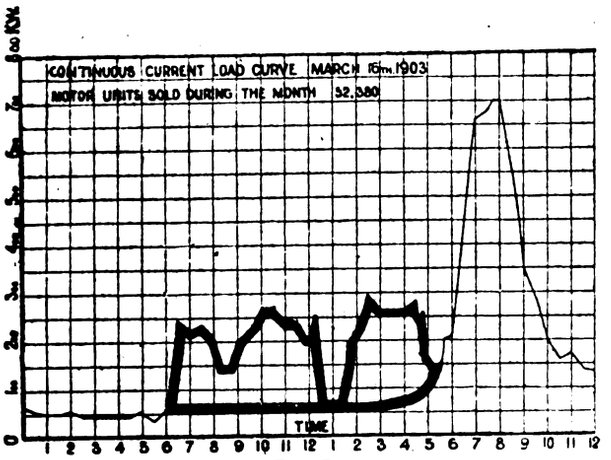


FIG. 3.

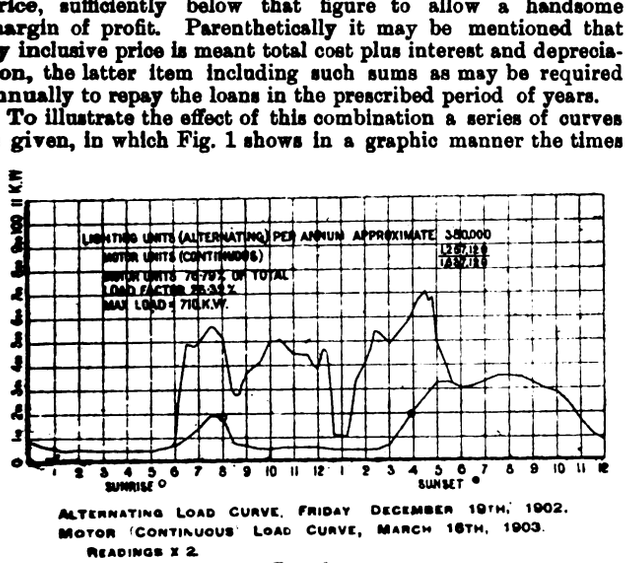
hours of darkness in generating current for lighting, which plant would otherwise be idle, or approximately so. Also one set of mains would serve both purposes. When this result can be obtained, the author ventures to predict that the selling price for motive power will average about 1d. per unit, and for lighting 3d. per unit. This would give an average all-round price per unit sold of 1·5d., and there is probably no one in this room who will dispute the feasibility of producing and distributing current under these conditions at an inclusive price, sufficiently below that figure to allow a handsome margin of profit. Parenthetically it may be mentioned that by inclusive price is meant total cost plus interest and depreciation, the latter item including such sums as may be required annually to repay the loans in the prescribed period of years.

To illustrate the effect of this combination a series of curves is given, in which Fig. 1 shows in a graphic manner the times



ALTERNATING LOAD CURVE, FRIDAY DECEMBER 19TH, 1902.
MOTOR (CONTINUOUS) LOAD CURVE, MARCH 16TH, 1903.
READINGS X 2.

FIG. 4.

of sunrise and sunset for each week during the year, the shaded portions showing the times when the motor and lighting loads would overlap. This presumes that the rise of load for lighting purposes commences about sunset. That this is so is demonstrated, so far as Bolton is concerned, in Fig. 2, which shows the rise which occurred about sunset for the first Friday in each month of the year 1902, Friday having been chosen owing to the fact that it is a heavy lighting evening, so that on these days any overlapping which exists would be shown at its worst. Fig. 3 represents the load curve (continuous current) for March 16, 1903, on which day the sun sets at 6.1 p.m. The portion of this curve presumed to be motor load is shaded. It will be noticed that the motor load is practically off before the lighting rise commences. In Fig. 4 the lower curve denotes the alternating (lighting) load for Dec. 19, 1902, and above it is superposed the motor load for March 16, 1903, this latter being doubled in height to produce the desired percentage. The actual number of units sold for power purposes in March, 1903, was 52,380, and, assuming that doubling the output would not alter the contour of the curve, and that it would remain much the same from month to month, this would represent an output per annum of:

	52,380 × 2 × 12 = 1,257,120
Alternating units sold (approximate)	380,000
	1,637,120

Motor units, 76·79 % of total; max. load, 710 kw.; load factor, 26·32 %.

To produce some such percentage as above mentioned for lighting and other purposes, the writer would urge the management of all (particularly municipal) supply undertakings to encourage a day load at practically any price per unit above their works cost. Such a price may be remunerative even if it be below the so-called total cost of production.

It is desirable, however, that the average price for motive power should not be less than one-fourth the average price for the lighting supply, the writer being of opinion that the most equitable ratio is about 1 to 3 for power and lighting supply. As the greater part of a day load will necessarily be for motive power, it is desirable that it should be considered from that point of view, and even if our prospective consumer has been persuaded to adopt motor driving, he may not be able to afford the necessary outlay for the installation, or, if able to command the necessary capital, he may not be disposed to invest it in motors of which personally he has little or no knowledge. Here is a case in which it is essential that the supply undertaking should take the responsibility of buying the motors and hiring them out to the consumers. Many corporations are now doing this and also some companies, the Bradford Corporation being the first to embark in this motor-hiring business, and all honour to them for leading the way. As, however, corporations cannot legally do this without special parliamentary powers, the Corporation with which the writer is connected got the following clause inserted in its parliamentary Bill in 1901: "The Corporation, if they think fit, may purchase, provide, sell, let for hire, and fix, set up, alter, repair, and remove, and otherwise deal in (but not manufacture), lamps, electric lines, electric motors, fittings, apparatus, and things for lighting, warming, ventilating, the cooking of food, and for motive power, and for all other purposes for which electric energy can or may be used or be otherwise necessary or proper for the supply, distribution, consumption, or use of electric energy, and may provide all materials and do all works necessary or proper in that behalf, and may require and take such remuneration in money, or such rents and charges for and make such terms and conditions with respect to the sale, letting, fixing, setting up, altering, repairing, or removing of such lamps, electric motors, electric lines, fittings, apparatus, and things, as aforesaid, and for securing (both as regards the consumer and third parties) their safety and return to the Corporation as the Corporation may think fit or as may be agreed upon between them and the person to or for whom the same are sold, supplied, let, fixed, set up, altered, repaired, or removed. Any lamps, motors, lines, fittings, apparatus, and things, as aforesaid, let for hire under the provisions of this section, shall not be subject to distress, or to the landlord's remedy for rent, or be liable to be taken in execution under any process of any court, or any proceedings in bankruptcy against the persons in whose possession the same may be. Provided that such lamps, motors, lines, and fittings have upon them respectively a distinguishing metal plate affixed to a conspicuous part thereof, or a distinguishing brand or other mark conspicuously impressed or made thereon, sufficiently indicating the Corporation as the actual owners thereof." Various corporations have obtained similar parliamentary powers.

In Bolton, the cost of the motor and fixing with starting switch is ascertained, and a rental of 10 per cent. per annum on the capital cost is charged. Some discussion has arisen lately as to whether that charge shall be 10, 12½, or 15 per cent., but the writer is of opinion that, for the time being at least, 10 per cent. is enough, because although that sum may not recoup the supply undertaking for the outlay and upkeep, a motor load is so all important to a station that it is better to lose a little on the motor hiring, and make it up, perhaps, a hundredfold in increased output of current and the revenue derived therefrom. The actual increased cost to the station for every unit sold for private motor supply is very little more than the cost of coal to generate that unit, and if that be, say, ·5d. (a figure which is higher than the cost of coal in a great many works), and the unit is sold for 1d., there is a profit of 50 per cent. on revenue for motive power to help to pay the standing charges, which would otherwise fall wholly on the lighting consumer. It may be mentioned here that the cost of upkeep for hired motors in Bolton was—

For the year ended March 31, 1902,	£2 13 0.	Rental, £108.
Ditto ditto March 31, 1903,	£20 10 11½.	,, £235.

Canvassers might with advantage be employed to go the round of small workshops of whatever trades are established in

Digitized by Google

the district, and point out to the proprietors thereof the many advantages of motor driving, and in many cases they might go the length of offering to instal motors for a month or two free of all cost, except current used, the motor to be removed also free of cost, if the customer wished it, at the end of the probationary period. If, however, the consumer is satisfied, motor rent would have to be paid from the date of commencement of supply.

In one or two cases which have come under the writer's notice, the hirer of the motor has expressed himself perfectly satisfied with the motor and its work, but has complained of the cost being 20 per cent. more than the motive power previously used. When this is enquired into the consumer produces his coal bill for three months and his bill for current for three months, at about 1·13d. per unit, the latter being about 20 per cent. more than the former. On his attention being called to the fact that he has either dismissed his fireman and engine driver, or put him to another job, he begins to see that electric driving is saving him about the same sum as he previously professed to be losing by it. The canvasser might also visit electroplating works and works where electric welding is at that time or is likely to be adopted, and offer the low motive power price for the purposes above mentioned.

The parliamentary powers cited above also give permission for the Corporation to undertake wiring work, and it would be well at this juncture to consider the advisability of corporations embarking in this business. Bolton took over its gasworks in 1872 from a private company, in conjunction with which was a fittings department, and so it was quite an easy matter for them to glide almost imperceptibly into the electric wiring trade. Although the average profit from this wiring department has been about £800 per annum for the last five years, the writer is of opinion that it is best left to private enterprise, as each electric wiring firm employs canvassers, who, without any real intention of so doing, really canvass without any fee or reward for the supply works. In several towns electrical exhibitions have been held, under the auspices of the supply works, and the writer would imagine these to be very beneficial, where motors and other consuming devices might be seen at work. The enumeration of the various apparatus on show would be out of place here, but amongst them might be mentioned electric radiators, grillers and cookers, electric desk fans, etc. At the same time, of course, the various kinds of wiring, switches, and lamps would be on view. Meters, prepayment and otherwise, would also find a place in the exhibition, and everything connected with the supply undertaking could be demonstrated to all and sundry who were interested therein. Our municipal technical schools should also be invited to assist the supply works by instituting lectures on motor drivng and its beneficial effect on all industries, both on a large and small scale. Huddersfield at one time sold a large quantity of energy to a carbide works, and if a sufficiently low price can be offered, there is no reason why other generating stations should not do the same.

In connection with the hiring of motors, the question of hiring arc lamps, electric radiators, and grillers might be considered, but although these may be of considerable importance, they are far less so than motor hiring. In the first place, because no very great amount of revenue is likely to be obtained from them, except in the case of arc lamps ; and, in the second place, they are all of them likely to be in use at the time of the maximum load on the station, and are therefore less worthy of being pushed. At the present time there is probably only one supply undertaking in this country which receives 10 per cent. of its revenue from its output for purposes other than lighting and tramway traction. It therefore becomes necessary for us to consider if we are making the most even of our lighting supply.

As the writer mentioned earlier in this paper, the most cogent method of increasing the supply is to lower the price, and if consumers can be shown any material saving from the adoption of electric lighting, our lighting output will largely increase in spite of the proportionately heavy cost of installation. Possibly the cost of electric wiring and fittings will be diminished in the near future, but even if the lowest limit be reached, there are many people who would not be able (or if able, willing) to pay the cost, as they may not happen to live in their own houses, and are, therefore, unwilling to wire a house out of which they may be liable to be turned at three or six months' notice. The landlord also, having paid for the gas installation, is not willing to undertake the financial responsibility involved. In such cases the so-called free wiring might be adopted, which has been brought to the notice of this association in a paper read at one of the previous conventions. The writer understands that this has proved very beneficial to several supply works, but he is not in favour of it, as in most cases an increased cost per unit of ½d. or 1d. is put upon the consumer for all time. He would prefer to adopt what he ventures to call "assisted wiring," which could be brought about by the corporation paying for the wiring being done by one of a number of wiring contractors approved by the corporation, such contractor guaranteeing to maintain the wiring in a good condition for three years, lamps, of course, being renewed at the expense of the consumer. The wiring and fittings to be the property of the corporation and the tenant to undertake to pay 9 per cent. of the total cost as rental quarterly with his account for current, the landlord or other approved guarantor to sign the agreement to pay the quarterly rental if the tenant fail to do so within a prescribed period. At the end of three years, the rentals having been duly paid representing the total cost of installation plus 8 per cent., which percentage the corporation would retain to cover interest on capital outlay and any slight cost entailed in collecting the amount by instalments, the installation would then become the property of the hirer. If, however, 9 per cent. per quarter pressed too hardly on the small consumer, 8, 6, or 5 per cent. might be charged as rental for a proportionately longer period. If this principle were adopted many cottages and small residential houses might obtain the benefits of electric lighting, and the supply station would benefit enormously by the acquisition of such a load, which would undoubtedly be a very good steady load all the year round, much better as far as it went than a smaller number of larger houses and villas, which are very often left by their owners for months at a time and which produce only a fitful revenue. In connection with assisted wiring, prepayment meters could be adopted, the supply works being secured from any loss by the constant moving about of some members of the artisan class whose memories are so defective that they forget to pay the gas bill or even the rent to the landlord.

Meter rents are also a matter worthy of consideration, and as the revenue derived therefrom forms such a small percentage of the total revenue of any electricity works, they might well be abolished, or if not abolished largely reduced. This is a matter which deserves earnest attention, as meter rents fixed ten or even five years ago, even if equitable at all, were based on the then cost of meters, which cost has diminished almost 50 per cent. since that time. Some electricity undertakings have already abolished meter rents, and the small amount of revenue which other undertakings would lose by following their example would probably be recouped by an increased demand for current. The cost of a service for electricity supply is relatively large, especially for a high-tension supply, and no means should be lost sight of for cheapening such cost, consistent with getting a reliable job and one which would not be specially liable to break down.

Street-lighting should undoubtedly be encouraged, and current sold for such a purpose at a very low price. This is a case in which a load factor of from 25 to 30 per cent. is often obtained, and supply authorities should not forget this in arranging their charges. In the writer's opinion a great many stations charge a price for this out of all proportion to the cost of production, and thus brings electric lighting of streets into such bad repute on the question of price.

Tramway supply also gives an excellent load, which should be got if possible, but it is too large a subject to be treated in this paper. Still, it must be remembered that, as in the case of street-lighting, the greatest demand on the supply works comes at the same time as the maximum lighting load. The writer is, therefore, of opinion that the price charged for current for tramway traction should be higher than for private motor supply, which gradually tails off from 5 to 6 o'clock each evening.

The charging of storage batteries in connection with electric motorcars should also be catered for, for in all probability this will be an important branch of supply in the near future.

No paper on this subject would be complete without some mention of methods of charging, and although this may not be in agreement with the general trend of opinion at this meeting, the writer is bound to confess that he is considerably out of love with the maximum demand method of charging, except in cases specially selected. Theoretically, this system of charging is unassailable, but there are many practical difficulties in the way of its beneficial use by a large number of consumers. For instance, although churches and chapels have a large maximum demand and a relatively small consumption of energy, yet they are good consumers, as their supply is mainly taken on a Sunday, when all shops and business premises are shut up. Glasgow has recognised this by allowing a specially low rate for churches and chapels. Then again, assembly rooms, where dances and evening parties are held, are in a somewhat similar position, for their load rarely, if ever, comes on the peak, but at a time later on in the evening, and on to the "wee sma' hours." Furthermore, the capital cost of installing demand indicators, and the extra cost of taking records, is out of proportion to the benefits obtained, especially when a large number of very small consumers have to be connected. If electric energy could be used for lighting, and lighting only, there might be a strong argument for the universal adoption of the maximum demand system, but the amount of motor driving now in operation, and the immense progress likely to be made in that direction in the near future, compel the writer to the opinion that such methods of charging are eminently undesirable in a general supply. What he would recommend is a reasonably low flat price for lighting, say not

Digitized by Google

more than 3½d. or 4d. per unit, leaving the committee in charge of the undertaking to give special terms to any large customer or special class of consumer. This might be a specially low flat price, calculated on the maximum demand principle, or on a quarterly rental per kilowatt installed, plus the charges for the time being adopted for motors, or any other method commending itself to them. Again, if slot meters be adopted, a flat rate must of necessity be given to such consumers, and if to them, why not to all?

Supply authorities have, in the author's opinion, done too much in the past to discourage the short-hour lighting consumer, and too little to encourage a day load, and if for a time they directed as much energy in the direction of encouraging the demand during the hours of light load, there would be much more likelihood of a magnificent harvest in the direction of a greater output, a better load factor, and a corresponding diminution of cost of supply, with the usual result of largely increased profits. Whatever may be said of the disadvantages of the maximum demand method of charging for lighting can be said with redoubled force for a motive power supply, for in this case the diversity factor is so great that it makes practically no difference to the supply undertaking whether the motors in any particular works are run continuously or intermittently. In this case also a flat rate should be adopted, with an initial higher price for the first 500-1,000, or any greater or less number of units per quarter which each undertaking can fix for itself before the really low flat price is obtained. In Bolton the charge is 2½d. per unit for the first 500 units per quarter, less 10 per cent. if the account be paid within 21 days of being rendered, then 1½d. per unit for the second 500 units per quarter, less 10 per cent., and any further quantity at 1d. per unit net. The reason for this is that there are many consumers whose consumption is so very small that, if 1d. per unit were charged from the start, the revenue derived from such consumers would barely pay interest, etc., on cost of services, cost of meter inspection, and cost of collection. This method of charging works very well, and is easily understood by any consumer. This also is for the general supply, but, as in the case of lighting, the author would leave the management of the undertaking to bargain with any specially large consumer, or for any supply demanded under special conditions. How these special conditions are to be met each committee and its technical adviser can devise for themselves, whether by a two-rate meter and time switch, giving a low price during the light load and a higher price during certain hours, or by any other method which they may deem expedient.

Consumers do not, as a class, understand the maximum demand principle of charging, and if it be explained to them with great care their intelligence seems to break down, although they may be in every other respect capable business men. This want of understanding engenders distrust, which is one of the greatest factors, not in stimulating the demand for electric energy for all purposes, but in materially retarding the same.

Bailie MACKENZIE, of Edinburgh, opened the discussion, and said it looked very suspicious to be frightened of opposition. He thought the Bermondsey clause was a most stupid one, as if an undertaking was not paying its way it would make matters worse to decrease the demand by increasing the rate of charging for electrical energy. He advocated that a corporation should supply good consumers at a price very slightly above works costs, but said that it was not easy to persuade colleagues on the council that it was often advantageous to charge often even under the average works cost. Thus, in Edinburgh they had a contract with the North British Railway Company to supply 1,000,000 units at 1½d. This had prevented the company putting in their own plant, and he was sure that both parties would gain from the contract. He advocated street-lighting as a means of advertising the undertaking, and had recently got through the Council an order for 100 more arc lamps at a price equal to 1½d. per unit.

Bailie WILLOCK, of Glasgow, said that they supplied churches and chapels at cheaper rates because they used their lights at a time when the ordinary load was not high. He agreed with the last speaker as to giving exceedingly low rates, and had agreed to supply at 1½d. to the Clyde Trust and to the railway companies. By so doing they had secured one half of the lighting of the Clyde Trust.

Mr. J. G. GRIFFIN, of Swindon, said that the local gas company had prevented them from carrying out their free-wiring system, but they had, with the help of free-wiring contractors, evaded the difficulty.

Mr. MCCOWEN, of Belfast, asked for information as to the success of schemes which discriminated in favour of motors not worked on peak load.

Mr. W. G. WALL, of Birkenhead, gave some interesting figures as to the reduction of cost by the introduction of a good motor load He did not, however, think it paid to supply power at 1d. per unit. He asked for information as to the best way of dealing with consumers in small houses, in order to avoid the comparatively heavy capital charge on the service and meters.

Mr. L. ROBINSON, of Hackney, said they had evaded the trouble of not having power to hire out motors by arranging with a manufacturer to act as agent for them. They hired out these motors on either a one, two, or three year agreement, and had secured a 400 h.p. motor load in a very short time.

Mr. A. B. MOUNTAIN said there were cases in which 1¼d. per unit even was much too high a charge. He had supplied a temporary carbide of calcium plant with a steady 24-hour load at ½d. per unit, the consumer bearing the capital outlay on the cables. They were also charging now $\frac{9}{10}$d. per unit to a large engine works with a 20 per cent. load factor.

Mr. A. E. HOADLEY, of Maidstone, said he had recently gone into the question of the actual cost of supplying a 60-h.p. motor in a refrigerating plant in a brewery, which plant was only required in the summer. He found the average load to be 38 kw., and that on a 10-hour day it only necessitated 1cwt. of coal extra over what was burned before. The extra oil and coal worked out at 0·3d. per unit, and they charged the consumer 1d. on the condition that the plant was never used during the lighting peak. He had had experience at Barking in the supply of small houses, for which only one service was run for eight houses. The connection was made through from house to house.

Mr. J. CHRISTIE, of Brighton, described a system he had introduced of supplying loads which were not to be used with the peak load at 1d. per unit. For this purpose a time switch was introduced. He had found that breweries and laundries had modified their hours of working to avail themselves of this cheap power. As no extra capital charge was involved it paid well. They had no trouble over their free wiring, having adopted a three-party agreement. They supplied motors driving the blowing apparatus of church organs at 1d. per unit.

Dr. PANTON only replied to one or two queries, and reserved the bulk of his reply for the printed discussion owing to the limited time available. A hearty vote of thanks was passed to him for his paper.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

605. What are the advantages and disadvantages of hammering electrical cables out of the ordinary round shape?—T. H. P.

606. It is required to obtain current at 200 volts from two shunt-wound dynamos, each giving 100 volts, and it is found that if the two machines be simply connected in series, with the shunt of each machine across its own brushes, the field of one dynamo dies away and is then reversed in direction, whilst if the field windings are connected in series and not connected at the intermediate point between the two armatures, the machines run all right. Explain this.—W. S. P.

[N.B.—Will H. F., who sent in Question No. 600, kindly forward to us his full name and address.—ED. *E. E.*]

Question No. 597.—Describe the electrical equipment of an electric automobile, with special reference to the motor, or motors, and wiring.

Best Answer to No. 597 (*awarded* 10*s.*).—That the electromobile has passed beyond the experimental stage has been successfully demonstrated by a car named the "Powerful," which completed a tour of over 2,000 miles in the autumn of 1901, and no apology need be made in placing this car before others. The "Powerful" belongs to the Kriéger class of electromobiles, following the designs by M. Kriéger, of the Compagnie Parisienne des Voitures Électriques, of Paris. This company is represented in England by the British and Foreign Electrical Vehicle Company, London. The carriage is a little over 10ft. in length, with a width over the axles of 6ft. 4in., the wheel base being the same length. The front wheels, to which the motors are attached, and which are also the steering wheels, have a diameter of about 3ft., and are fitted with Michelin pneumatic tyres with a tube diameter of 120mm. (4¾in.). The rear wheels have a diameter of about 3ft. 4in., and have similar tyres.

The accumulators are carried in two groups, 25 in a case immediately over the front wheels, and 25 in a similar space over the rear wheels, below the seats for driver and

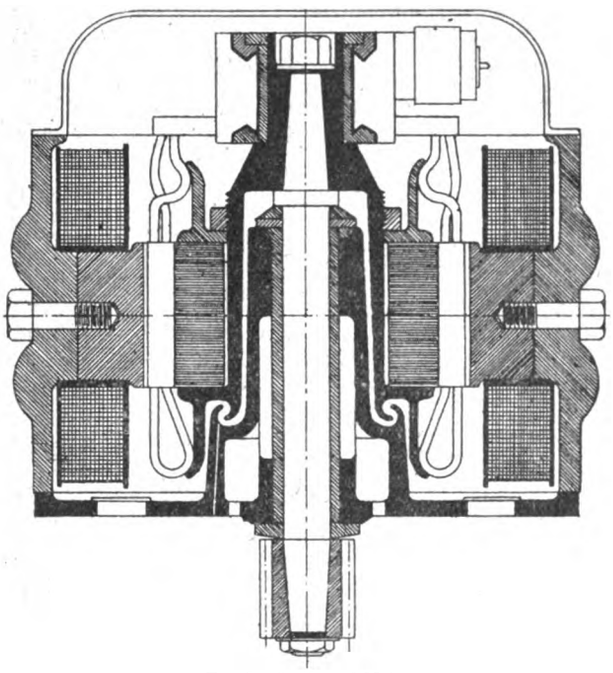

Fig. 1.—Section of Motor.

passengers. Each battery case contains five boxes, each measuring 2ft. 1in. long, 7in. wide, and 16in. deep, and holding five accumulator cells, 6¼in. by 4¾in. and 14½in. high. The design of these accumulators is due to Mr. Henry Leitner, and takes the form of thin perforated sheets of lead with a slightly raised undercut ridge along the edge of the perforations, thereby stiffening the plate, and also preventing the active material from falling out. Each cell contains six pairs of plates, separated by perforated grids of ebonite; the two outer negative plates in each cell are of half the thickness of the other plates, being 3mm. instead of 6mm. This form of accumulator has a high capacity per unit of weight—a very important consideration in electromobile traction. The total weight of the 50 cells is 22cwt., and the weight of the car complete with its batteries is 42cwt.

The motors, as previously stated, drive the front wheels and work independently of each other. They are of the four-pole iron-clad type, a longitudinal section being shown in Fig. 1, in which some rather novel points in the design will be noticed. The armature spider is of gunmetal secured to the shaft at the commutator end and recessed to admit the bearing. This bearing is very long, and supports the armature at about its centre of gravity. It is of gunmetal, forming one casting with the end plate. A solid bronze bush is driven in this casting, which has a slot cut through it, longitudinally, for about one-third of its length. Automatic lubrication is effected by means of a piece of wick dipping into an oil well in the casting and placed in this slot, similar to the method of lubrication in traction motors. The poles have each a shunt and series winding, the latter being placed on the top of the former. The armature is of the usual slotted-drum type, with a four-circuit winding. The winding is cross-connected, so that only two brush sets are required, the brushes being of carbon. The motors are enclosed in light iron casings provided with ventilating apertures, the latter being covered with very fine wire gauze. The attachment of the motors to the main frame of the carriage is by a simple arrangement of springs and levers, so that any relative motion of the motor takes place in an arc concentric with the axle. The motors drive the wheels by spur gearing, the "gear ratio" being nearly 1 : 12—*i.e.*, the pinion has 11 teeth and the spur wheel 133 teeth. The pinions are made out of rolled steel, tempered after being cut, and each spur wheel is firmly fixed to a front wheel of the carriage. The output of each motor is 4½ b.h.p., with a normal current of 40 amperes at 100 volts for continuous running, the speed being 2,000 revolutions per minute. Each motor weighs 150lb., thus making the weight per brake horse-power equal to 33·3lb., a result comparing very favourably with steam and other motors.

The system of control adopted is extremely interesting and ingenious, being the "series-parallel" arrangement with considerable modifications. The controller surrounds the steering bar, and consists of a cylinder of insulating

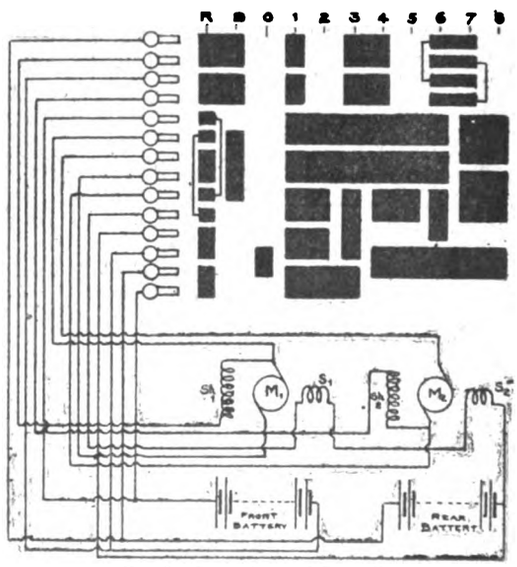

Fig. 2.—Connections of Controller.

material with pieces of copper mounted on it for about half of the circumference. Fig. 2 shows the "development" of this controller, in which the copper contacts are shown black. Pressing against these are 14 copper brushes connected to various parts of the system, as shown in Fig. 2. On the top of the controller case is a dial, divided through a little more than half its circumference into 11 divisions, marked respectively R, B, O, and numbers from 1 to 8. A pointer on the controller spindle indicates the position of the controller. In the system of control adopted on the "Powerful" all the notches are "running" notches, there being *no* resistances used whatever. The economy resulting from this method will be at once obvious. In Fig. 3 are given the connections for each notch of the controller. M_1 M_2 are the armatures of the motors, S_1 S_2 the series coils, and Sh_1 Sh_2 the shunt coils of each motor respectively. The diagrams need little explanation. The reversing notch, R, is useful when the car is required to "back," and gives a speed of about three miles an hour, the motors in this case being connected as compound. The electric brake, B, is intended as an emergency stop, the armatures in this case being short-circuited. Notch No. 1 connects the motors as compound. This gives a full field and a very good starting torque, the speed in this case being about three miles an hour. Notch No. 2 is useful for running behind slow-moving traffic, the speed being about four miles an hour. The motors are connected as

Digitized by Google

shunt machines in notch No. 5. This gives a very good braking effect when going down hill, and at the same time recharges the batteries as soon as the speed raises the armature voltage higher than that of the batteries. From the fourth notch and onwards the batteries are in series. Notch No. 4 gives a speed of about eight miles an hour on the level, and is very useful for hill climbing. In notch No. 6 the motors are capable of recharging the batteries, though this time the braking effect is not so great as in notch No. 5. The maximum speed (about 24 miles an hour on a level road) is reached at notch No. 8, the armatures in this case being in parallel.

A useful addition to the control of the car is a cut-out operated by the same foot lever which applies the mechanical brake to the rear wheels. Another addition is a double-contact switch to enable the batteries to be charged in parallel as well as in series. The headlights are taken direct off the batteries.

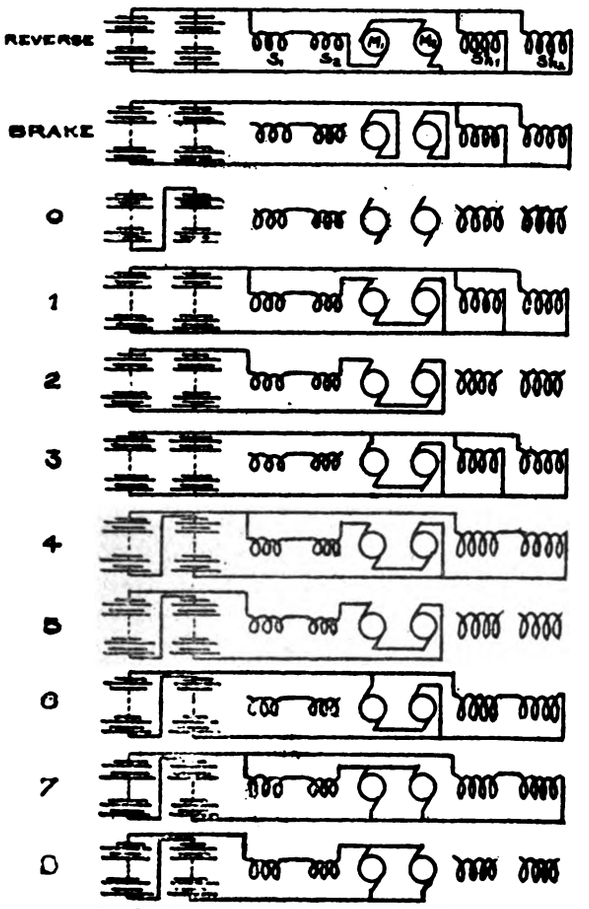

FIG. 5.—Connections of Motors at each "Notch."

It may be mentioned that the tour included some of the steepest gradients in the country (in some cases being 1 in 7½), and these the car took without any mishap whatever. During the whole tour, which totalled over 2,000 miles, no difficulties were encountered in getting the accumulators recharged, and the "Powerful" could run 95 miles on a single charge. The total expenses for charging during the tour amounted to 2½d. per car mile, or 0·65d. per passenger per mile, there being four passengers carried. The renewals required for the accumulators was practically *nil*, notwithstanding the very severe test they were put to in surmounting some of the hills in Cumberland.—A. D.

Question No. 598.—In order to test high-tension cables, it is necessary to have ready means of varying the pressure to suit the test specified. Can this be done best by adding to or reducing the number of transformers in series, or what is the best way?

Best Answer to No. 598 (*awarded* 10*s.*).—Though the method of varying the voltage by cutting different transformers, or different coils on one transformer, in or out of circuit (Fig. 1) is in fairly common use, it is not the most satisfactory, as it necessitates the full voltage being switched on at once. When dealing with high tensions and cables of large capacity, such sudden changes of voltage may lead to an excessive rise of potential due to resonance effects. Sometimes this difficulty is partially got over by arranging the switch (Fig. 2) to make contact at one step before breaking with the last (a resistance being inserted between the front and back parts of the switch to prevent an excessive current passing in the short-circuited coil), thus permitting the voltage to be increased

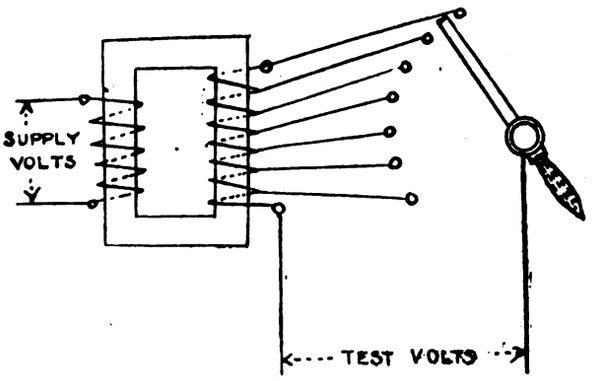

FIG. 1.

gradually and without flashing at the contacts after connecting the cable.

A better method of adjusting the voltage is to have a single transformer giving the maximum secondary voltage ever required, when the full available primary voltage is in use, and to obtain lower secondary voltages by inserting either a finely subdivided resistance or an adjustable

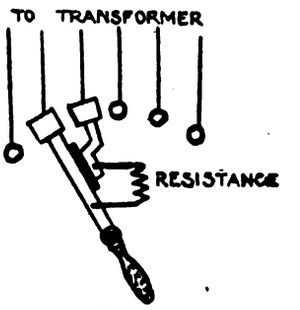

FIG. 2.

choking coil in the primary circuit (Fig. 3). In this way, by using a sufficiently large resistance or choking coil, the secondary voltage can be reduced to a very low value at first, and can then be gradually increased by cutting out steps of resistance or drawing the iron core of the choking coil further and further out of the coil. A still better arrangement as far as efficiency and the gradual change of

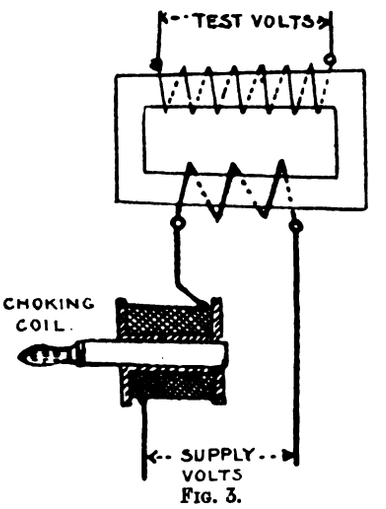

FIG. 3.

voltage are concerned, though a rather more expensive one, consists of a transformer built on the Cowan and Still voltage-regulator principle (Fig. 4). In this the primary is wound on a core capable of being rotated through a quarter of a circle, so as either to link the whole of its flux effectively with the secondary winding, thus giving the maximum voltage (core vertical in Fig. 4), or else linking its flux in

Digitized by Google

such a way that the volts induced in the secondary cancel out (core horizontal in Fig. 4). By placing the core in

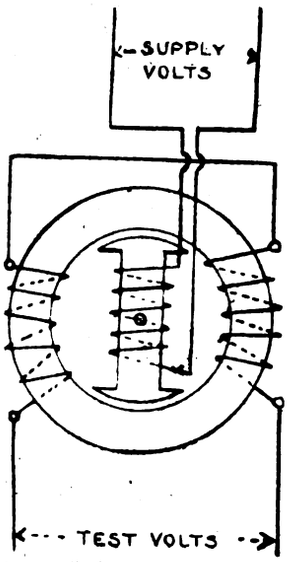

FIG. 4.

intermediate positions, any required intermediate voltage can be obtained with the greatest exactitude.—Q.

Answer to No. 598 (*awarded* 7*s.* 6*d.*).—Cable manufacturers now have a very perfect system of testing the insulation of high-tension cables This system may be divided into two distinct tests—viz., the low-tension and the high-tension.

The low-tension test is made in the usual way by means of a Silvertown or Kelvin testing set, to ensure the absence of moisture and other causes of a dead short-circuit when a high voltage is applied to the cable under test. If the low-tension test is satisfactory, the cable is subjected to an alternating voltage of from 1,000 to 5,000, and in some extreme cases to as much as 20,000 volts. Fig. 1 shows the connections of one method of making a high-voltage test, in which it is possible to obtain widely-varying voltages up to 9,000 volts if desired. K is a two-pole switch; C is a circuit breaker, which opens when low insulation allows too large a current to pass; A is an ammeter; P is the primary coil of a variable transformer, T, designed for a high voltage; L is a pulley, round which is wound a card,

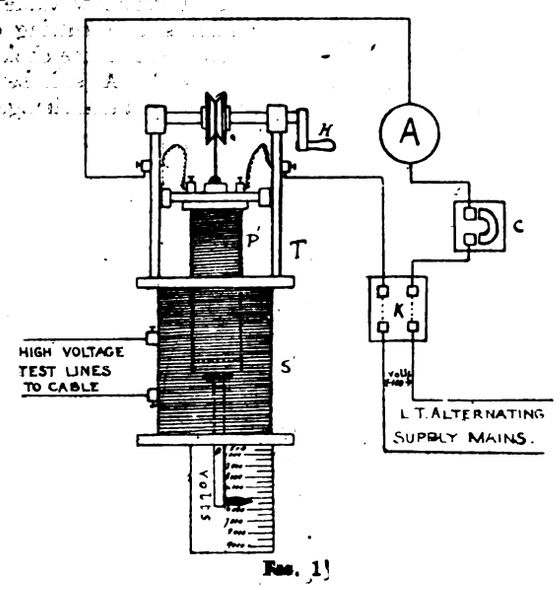

FIG. 1.

attached to the primary coil, which slides in and out of the secondary, S, when handle, H, is turned. To the bottom of the primary is fixed an arm carrying a pointer, which moves over a calibrated scale, so that the voltage at the terminals of the secondary may be read off for any position of the primary coil. Although the theory of the action of this transformer will be understood, it will not be out of place to give it here. When the primary coil is right inside the secondary, all of the latter's coils are cut by the primary's line of force, whereas when outside, only a few of the lines reach it; consequently the secondary voltage is correspondingly lowered. It will, therefore, be seen that it is possible to obtain varying voltages in a very simple manner.

Having explained how a high voltage is obtained, it might be well to make a few remarks on the carrying out of a test. After the test lines from the "secondary" terminals of the transformer have been firmly attached to the insulation to be measured, raise the primary coil till it is near the top of the "secondary"; this will prevent too high a voltage being suddenly applied to the insulation. Switch, K, may now be closed, exciting the primary off the 100-volt mains of an alternating-current system. The handle, H, is now turned, letting down the primary into the secondary, until the insulation under test either breaks down or stands the full voltage obtainable. It is well to have an opposing weight acting on the pulley, as this prevents the voltage being raised too suddenly, besides automatically returning the coil to its zero position—*i.e.*, top of the secondary—should the operator accidentally leave it in the position of full voltage. An electrometer or electrostatic voltmeter (not shown in figure) is put across the secondary terminals, its readings being a check against the readings on the transformer scale. When switch, K, is closed ammeter, A, indicates the primary current, which should remain constant if the insulation is perfect, as in this case there is no reaction on the primary, owing to no current in the secondary coils. Should the insulation break down a large current flows through the secondary, which reacts on the primary, lessening its induction. This causes a larger current to flow through the primary. As the circuit breaker, C, is set to open when a small increase of current takes place, the exciting circuit for the primary is broken.

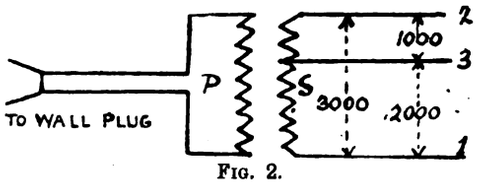

FIG. 2.

It will be seen that all switching is done on the low-tension side, thus minimising the risks attending all high-tension work. Another method, which is perhaps more flexible than the first, is shown in Fig. 2. P is the primary of a transformer, having its ends attached to a plug capable of being inserted in a lamp socket on the alternate-current lighting mains. The secondary coil, S, has several leads brought out, by means of which different secondary voltages may be obtained. Suppose that by using the two outside leads the voltage is raised to 3,000, then between leads 1 and 3 there will be 2,000 volts, and between leads 3 and 2 1,000 volts. These steps may be increased within the limits by putting on extra leads.—J. W. R.

Answer to No. 598 (*awarded* 5*s.*).—In order to test high-tension cables, it is necessary to have a ready *means of varying the pressure*, etc. The variation of the voltage to suit the tests can be obtained by connecting the primaries (thick coil winding) of the transformers in parallel and the secondaries in series, but this method, in the writer's opinion, does not admit of a very quick and easy means of regulation, unless elaborate switchgear be employed. The best arrangement for testing in this case would be to have a special transformer, a variable non-inductive resistance being inserted in the primary circuit. The following is a description of a transformer suitable for "high-tension" testing, the design of which is due to Mr. H. F. Parshall.*

In Fig. 1 and 2 are given sketches showing the arrangement of the coils and magnetic circuit. It will be noticed that the primary and secondary are wound on the opposite "legs" of the core. This is of great advantage in testing work, as, even with a "dead short" on the secondary (due to the breaking down of the specimen under test), no great flow of current takes place in the primary on account of

* A very interesting series of tests made with a transformer of this design are described by Messrs. Parshall and Hobart in their work on "Electric Generators," pp. 47 to 57.

Digitized by Google

the magnetic leakage. With ordinary transformers, on the other hand, this result would probably be accompanied by the blowing of the primary fuses.

The core is of the single magnetic circuit type, and built up of iron punchings 1¼in. by 7¾in. and 1¼in. by 4¼in. for sides and ends respectively, and 0·014in. thick. The net sectional area of iron in the core is 3·65 square inches. With an impressed E.M.F. of "form factor" = 1·25, the density is 36·4 kilo-lines per square inch. (The term "form factor" was introduced by Prof. Fleming to denote the ratio of the square root of the mean of the squares of the equi-spaced ordinates of a curve to the true mean value of the equi-spaced ordinates.*) The primary and secondary are wound on opposite legs of the core (see Figs. 1 and 2). The primary consists of two former-wound coils slipped into place side by side. The conductor is No. 13 S.W.G. double cotton-covered wire, and each coil consists of 75 turns wound in three layers, thus making the total number of primary turns 150. The secondary is wound in six sections on a wooden bobbin, as shown in the figures. The conductor in this case is No. 33 S.W.G. double silk-covered wire, and each coil consists of 1,600 turns, giving a total of 9,600 secondary turns. The primary coils are wrapped with a layer of tape half lapped and shellaced, and are slipped over a layer of composite mica on the core. The secondary coils are wound direct on the wooden bobbin, which is thoroughly baked and shellaced, and are covered on the outside with a few layers of tape. The ends of each secondary coil are brought out to a connection board and the ends of the primary are brought out to a similar board, which admits of various groupings of the coils. A water rheostat is connected in series with the primary, and forms a ready means of varying the secondary voltage.

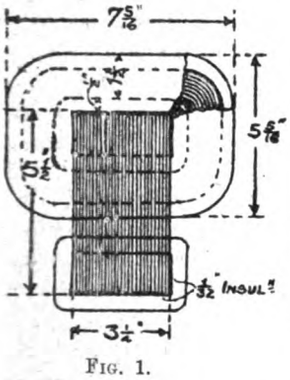

FIG. 1.

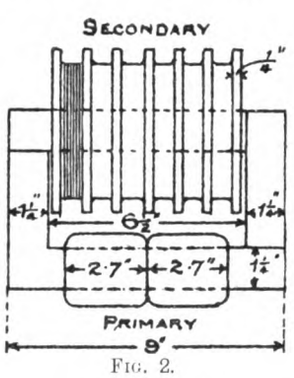

FIG. 2.

The transformer as described was used for testing materials, the secondary voltage being varied in the tests from 2,000 to 8,000 volts. The windings, of course, can be proportioned for higher voltages to suit the specific requirements of one particular branch of testing. In the writer's opinion, such a transformer offers several advantages over the method of grouping several independent transformers in series, the primaries, of course, being in parallel across the mains. A transformer of this type is also very compact, the main function of such a transformer being simply to transform a low voltage to a higher one, and, therefore, the conditions are very different from those met with in ordinary lighting transformers.—A. D.

LONDON TRAFFIC COMMISSION.

Sir David Barbour presided over a further sitting of the Royal Commission on London Locomotion at Westminster on Friday.

Mr. H. E. Haward, the comptroller of the London County Council, was the witness, and offered evidence as the financial position of the tube railway companies of London. He stated, in reply to questions, that the capital involved in tube railway undertakings, existing, authorised, and proposed, amounted to £50,257,000. This sum was made up as follows: tube railways now in operation, £7,518,000; in course of construction, £18,493,000; authorised, but not yet commenced, £3,680,000; new railways, including extensions of existing railways, proposed by Bills as introduced into Parliament this session, £20,586,000. In regard to the financial position of existing tube railway undertakings, he gave details of the Central London, the City and South London, and the Waterloo and City Railway. He wished to make the following observations as a result of his consideration of the financial particulars of the various companies. With regard to the raising of capital, he said that great difficulty had been experienced in raising capital for those enterprises. The Central London made more than one unsuccessful attempt to issue its capital to the public in the ordinary way, and its stocks were finally syndicated and issued in blocks. The Electric Traction Company, Limited, had allotted to it £672,000 of the 4 per cent. debenture stock. The Electric Traction Company was formed to construct the Central London Railway. He understood that the issue of the Great Northern, Piccadilly, and Brompton guaranteee stock this year was unsuccessful, the underwriters having been left with 50 per cent. of the total. The methods of the Yerkes group of financiers illustrated very clearly the difficulty experienced in inducing the public to find the necessary capital for tube railways. Dealing with the cost per mile, he said that that varied very considerably. The Central London cost about £554,000 per mile, the Waterloo and City less than £400,000, and the City and South London £350,000. The traffic receipts of all three companies were increasing, and in this connection it was to be noted that each of the railways delivered its passengers right into the heart of the City. Working expenses he found ranged between 45 and 55 per cent. of the gross receipts, and showed a tendency to the former figure. Dividends, while showing an upward tendency, had been very moderate, in no case exceeding 4 per cent. Dealing with the question of raising the further capital required for tube railways, witness said that the public was interested in the raising of such capital in the most economical manner, and that was not likely to be done by a company which was unable to induce the public to subscribe readily its stock. The effect of an extravagant method of raising capital would be to inflate the capital of the company. Continuing, witness said that a company that could not readily obtain capital was also unlikely from time to time to take steps to improve its accommodation or extend its facilities where such involved the expenditure of capital. If all the parliamentary powers sought in the session of 1903 were ultimately obtained, the public would be asked to subscribe a further £38,500,000 for tube railway undertakings. The prospect of that sum being raised at all was, he thought, remote, and he considered it improbable that any considerable sum could be raised economically. To pay working expenses, 5 per cent. interest on share capital and 4 per cent. on loan capital would require the conveying of nearly 600,000,000 passengers at a fare of 2d. each, which was a somewhat higher average fare than was probable. The three tube railways in operation carried less than 70,000,000 passengers per annum. Witness then dealt at considerable length with the financial inter-arrangements, so far as known, of the Underground Electric Railways Company of London, Messrs. Speyer Bros., and the various statutory tube railways and other companies, and concluded by submitting a statement showing the total sums spent or voted by the London County Council on capital account for tramways up to March 31 last. In that statement he had included an approximate computation of the further outlay involved in the schemes for purchase of further lines, construction or extensions, and the conversion of horse lines to electric traction. The amounts expended or voted up to March 31 last was £3,650,000 for lines and equipment, including purchase, and £750,000 for power supply. The further outlay in prospect was estimated to be as follows: purchase of undertakings, £200,000; conversion of remaining undertakings, £2,720,000; and new lines already agreed to by the Council, including proportion of cost of street widenings to be charged to tramways account, £1,077,000. The total outlay, including addition for street widenings and contingencies, being estimated to amount to £11,422,000. There would be a substantial decrease, no doubt, in the working expenses. The horse-car system was worked at about 9½d. per car mile, while the estimated cost for electrical working was sometimes put as low as 6d., including all expenses connected with the supply of power.

The Commission then adjourned for the summer vacation.

* See "The Alternate-Current Transformer," vol. 1, p. 583, second edition.

APPOINTMENTS VACANT.

Assistant Superintendent, Indian Telegraph Department, Rs. 4,200 a year. Apply, Secretary, Judicial and Public Department, India Office, Whitehall, London, S.W., Aug. 1. Advertisement in previous issue.

Electric Wiring Clerk of Works, Parish of St. Pancras, £3 per week. Advertisement in last issue.

Estimating Engineer for large electrical works in the Midlands. Advertisement in last issue.

Electrician (working) for collieries near Durham. Advertisement in last issue.

Representative.—Firm of manufacturers require energetic representative for developing sale of new type of transformers. Advertisement in last issue.

Switchboard Attendant, Corporation of Swindon, 27s. 6d. per week, Aug. 3. See advertisement in last issue.

Consulting Electrical Engineer.—The Town Council of Bo'ness, N.B., being about to introduce an electrical installation into the burgh, for which they have obtained a provisional order, are in want of the assistance of an electrical consulting engineer to consult and advise with them now and during the execution of the contract. Applications by Aug. 1.

Instructor in Mathematics.—The Governing Body of the Northampton Institute invite applications for the post of mathematical instructor, Aug. 24. See advertisement.

Tramway Car Draughtsman. Permanent and improving position to right man. See advertisement.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Bound Volumes of "THE ELECTRICAL ENGINEER," containing half-year's copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, July to December, 1902, now ready.

IRON AND STEEL.

Political matters must as a rule be eschewed by technical papers, but when the political matters relate to economic questions they can only be dealt with properly by those well versed in business problems. At last Tuesday's meeting of the London County Council a very interesting topic was mentioned, about which a little more information is wanted. It was pointed out that the Council wanted some forty-two thousand pounds' worth of steel girders. They asked nine firms to tender to supply within twelve months. Only four firms had tendered and each had asked for eighteen months, on the ground they were so busy. The other firms had declined to tender at all for the same reason. And then the *Chronicle* remarks, it throws a little light on the question of "dumping." It does, but not in the manner the *Chronicle* would have us believe. With regard to this transaction there are many questions we should like answered. Who selected the nine firms, and why were those firms selected? Why was not the want advertised openly, and the work tendered for openly? Does Mr. Benn, or whoever may be the leading spirit in these hole-and-corner proceedings, wish us to believe that Great Britain cannot execute an order for forty-two thousand pounds' worth of girders under eighteen months? What about the specification for the work? Is it of the usual London County Council type—interfering with business organisation that does not concern it at all, and compelling British makers to comply with certain things that foreign makers cannot be made to comply with, thus giving the foreign makers a huge preferential tariff, against which British makers are powerless. Why should manufacturers be harassed by any council? We have throughout this country a set of blatant humbugs—gentle and simple—crying "free trade," "free trade." "Anathema to all who doubt free trade." And yet these same men, whenever they have an opportunity, are the first to be protectionists, yes, and protect foreign competitors against their own neighbours whose money they are so lavishly spending. The firms selected by the wire-pullers of the County Council no doubt gave one reason, and that a valid one, but we very much doubt if it was the real one for not putting themselves to much trouble about the County Council or its requirements. We have never favoured this system of tender by selection. It has some excellent qualities, but, on the other hand, is open to every evil known in business circles. Some time ago it was a case of tramrails going to Continental makers; will these girders go likewise? As a plain matter of fact the action of the London County Council, as do the actions of other councils, play into the hands of manufacturers unfettered by restrictions, so that the competitors do not start level. If that is the conception of free trade or fair trade held in the Council, the sooner the fight of fiscal reform comes on the better. In the recently published return on iron and steel we get these figures with regard to steel. During the period 1890-1901 the production of steel in this country increased about 33 per cent., in Germany 300 per cent., in Belgium over 100 per cent. It is a serious question to consider what part of this increase, say, in Belgium, is due to the action of members of councils insisting upon certain clauses in specifications which are very pertinent here, but practically a dead letter there. But the Government also has much to answer for in its treatment of manufacturers. During the late war the navy and military authorities were somewhat hampered by the fact that all the carbons required for their search-lights had to be obtained from Germany. Concern was expressed by the responsible heads of these services that there were no

Digitized by Google

English manufacturers of carbons. This state of affairs is now altered, but the following approximate figures, the general accuracy of which we can guarantee, show what our English manufacturers have to face. Previous to January, 1899, the wholesale price of a certain size of carbon stood at 72s. per thousand feet. Owing to competition in Germany the price then fell slowly to 64s., which killed the new German manufacturer. Immediately the price was raised by the ring to 82s. 6d. This was in April, 1900, and it stood at that figure until works had been established in England. The prices in Germany have not, we believe, been altered appreciably since, but the price for English contracts has been brought down to 53s. 8d., which is quite an unprecedented figure. It can fairly be presumed that it is an unremunerative one, as at 64s. a German competitor was compelled to close his works. The English factory is, of course, losing money, and the whole of the Government orders and those for corporations are going abroad on account of price. The starting of the English factory has reduced prices in England by 35 per cent., but only by reason of "dumping," in which the *Chronicle* does not believe. Probably they will say it is just what any business folks would do to crush a rival. We agree, but would ask the *Chronicle*, What chance has the English manufacturer of crushing his German competitors with the same weapon?

SUMMER YEARNINGS.

The brasswork's bright and burnished, the tiles are shiny clean,
And the paint on the machines is flaming new:
But there's nothing in the summertime like grass or arbor green;
Unless it is the shade of ocean blue.
The armatures are humming, as they take the load with ease,
And the piston's throb makes tremors on the floor:
But let me hear the rustling of the West wind through the trees,
And the banging of the surf upon the shore.

There's warmth from muck-lagged steam-pipes, there's light from arcs galore,
There's a perfume of sulphuric from the cells:
But O! for solar rays that from the outer heavens pour;
And, for preference, the farmyard's soothing smells.
The stokers chant their vespers, and the drivers breathe their woes
("By-our-Lady" is the term they most adore):
But let me hear the bleat of sheep, the ripple song that flows
From the moorland to the sand-befringed shore.

Hail the time of tidal motors! Hail the time when mountain's flood
Twists the winding on the spindle past the pole!
When the men who pull the switches will not hanker for the blood
Of the fiend who first proclaimed the use of coal.
For the summertime is with us, the load curve shrinketh small,
And the lust for Nature sweats from every pore.
Take away that blasted feed pump! take away that glazed brick wall!
Give me sunshine, and God's Peace, upon the shore.

B. C. H. J.

FORTHCOMING EVENTS.

Iron and Steel Institute.—Summer meeting, Barrow-in-Furness, September 1-4.

Municipal and County Engineers.—Meetings: Aberdeen, Aug. 20, 21, and 22; Hastings, September 11 and 12. Detailed programmes will be issued when definite arrangements are made.

THE VERBAND DEUTSCHER ELEKTROTECHNIKER.

(Continued from page 929, Vol. XXXI.)

The following is a translation of one of the papers read before the above institution at their annual meeting in Mannheim.

The Parallel Running of Alternators.

BY H. GÖRGES.

The steady running of alternators in parallel is a question which is still fraught with great importance. While, on the one hand, the increasing employment of the steam-turbine tends to lessen its import; on the other hand, the construction of large gas-engines has given the problem renewed prominence. Nor can it be denied that the difficulties of solution have increased with time. The causes of this are to be found, as we shall presently see, in the adoption of slower speeds and the greater economy effected in the use of materials, as a consequence of which the momentum of the moving parts for the same output of machine has been reduced. The phenomena which pertain to parallel running, more particularly in regard to the oscillations which occur, are of such a complex nature as to defy full appreciation without the employment of mathematics or graphic methods of illustration. But it will be useful, nevertheless, to attempt at least a qualitative explanation by simple argument. The principle of the conservation of energy is best adapted as a basis from which to trace the phenomena. But as we have here to deal exclusively with practically constant speeds, we shall do well to confine our attention to the consideration of the output. We will assume, in the first place, that one machine only is running and supplying current to an incandescent lamp load. In this case the flickering of the lights due to unsteady running will be inappreciable. There will, of course, be slight changes in the speed due to uneven turning moment, but the variation from the normal speed will affect the total output so little that we may neglect the variation and regard the speed as constant. In spite of this, the variations in speed have an important bearing, since the excess of energy transmitted over the output yielded, neglecting for the moment the losses in the machine itself, must be stored up in the flywheel, and for this purpose changes of speed are necessary. The energy absorbed by the flywheel is proportional to the moment of inertia, the angular velocity, and the increase of the angular velocity per second. The moment of inertia is not quite constant, but varies slightly according to the position of the crank relative to the reciprocating parts. These variations are slight, however, as are also the variations in the speed, which we may assume to be the normal angular velocity. The flywheel may be regarded as an accumulator of energy, which exerts a steadying influence on the speed.

But the case is different if the machine works on an asynchronous motor load. The energy absorbed by the latter is proportional to the slip. When synchronism has been attained, it is approximately nil; it is positive for slower and negative for higher speeds. We must now determine the normal speed, and observe the variations from this. If the speed of the generator be increased, the output demanded from it will be greater accordingly, since the motor will then have a positive slip. While in the first case the load on the machine could be looked upon as independent of the slight variations of the speed, it is now directly proportional to these variations. The energy transmitted to the flywheel is proportional to the speed variation per second, the load represented by asynchronous motors depending upon the speed variations themselves. It is obvious that in the second case the variations in speed must be less than in the former; for as the speed increases due to an excess of input over output, the output grows, and relative difference in acceleration becomes less. This effect, which is directly proportional to the fluctuation in the speed, is called "damping." That is to say, asynchronous motors have a damping effect on the working of the primary machine. The regulating effect of the flywheel is naturally lessened. According as the slip of the motors at full load is reduced, the greater

Digitized by Google

will be the damping effect. Assuming the damping to be very great, then a very slight variation from the normal speed will cause a considerable augmentation or decrease of the load on the primary machine. Hence the machine, without any considerable change in speed, has to accommodate its output to the fluctuating demand, while the revolving parts can no longer store up the excess energy consequent upon the variations in speed, upon which function their efficiency depends.

We might assume, as a third condition, that our machine is working on a synchronous motor load. In this case similar phenomena occur as when several machines are working in parallel on a common network. We will consider the latter case. For the sake of simplicity we will assume that there is a constant voltage at constant frequency on the 'bus bars. This will be the case if the machines which furnish this pressure run with absolute uniformity and the load on the network is constant. Let us further assume that our machine is coupled to the 'bus bars. It receives a certain constant or periodically varying input from its driving engine, and yields a certain output to the 'bus bars, which output we have now to consider. The excess must be absorbed by the moving parts, and the amount of deficit made up from the store so provided. But this is only possible if variations of speed occur.

In the first place, the machine must run in synchronism—that is to say, with an equal number of poles at the same speed and with an unequal number of poles at speeds inversely proportional to the number of poles. It is further necessary that the phases of the E.M.F. supplied by the individual machines shall be approximately alike, and this necessitates a certain relative position of the rotating parts of the individual machines at each moment. We may therefore speak of a normal position which the machine should occupy at each moment. According to our assumption, this normal position would be maintained constant if it were once fixed and the machine then worked at absolutely constant speed. If, however, fluctuations occur in the speed, the rotor of the machine will vary from the position which it should occupy at any given moment, thereby causing lag and lead of the phases.

Broadly speaking, in the case of machines running in parallel, it is the difference between the E.M.F. on light load and the pressure at the 'bus bars which governs the current yielded by the individual machines. If we regard the pressure at the 'bus bars as constant, then this difference in the case of continuous-current machines, though very small, is directly dependent on the speed. With alternating-current machines the difference is very much greater, and far less dependent on the speed than upon the lead and lag just mentioned. We may in the first approximation neglect the direct influence of the speed, and have, therefore, a different set of conditions than with the continuous-current machines. While, with regard to the latter, the armature position does not matter, it is of great importance with alternating-current machines. We regard as the normal position of the armature that in which the output obtained equals the mean input. A lead increases, a lag diminishes the output. We may regard the variation as directly proportional to the angular deviation from the normal position.

Let us assume for the moment that the input be constant. Then, apart from the losses, the input and output at the normal position are equal—every lead results in an excess output and every lag in an excess input. A braking effect, therefore, results from the lead, and an accelerating force from the lag. This force, which obviously tends to bring the armature of the machine again into its correct position and so maintain the synchronism, is called the "synchronising torque." To be more accurate, we may describe the synchronising torque as that due to the difference between the input and output which occurs within unit deviation. So far we have not considered the damping. Let us now assume that the machine possesses either a natural or an artificial damping. Damping invariably exists if eddy currents can circulate in the field-magnet poles. In massive poles it will exist to a greater extent than in laminated poles, and where a damping winding is provided in a very much greater measure. In order to observe the effects of the damping, we will assume the continuous-current excitation to be cut off. The machine then behaves like an asynchronous motor connected to a live network. It runs light when exact synchronism has been attained. If its speed is too low the machine absorbs current, and if too high it yields electrical energy. Hence we have exactly the same behaviour as in the case of the generator, previously described, which supplied current to asynchronous motors. Its work is positive or negative and exactly proportional to the difference between the actual and the normal speeds. If we close the continuous-current field circuit, then we shall have to distinguish between two parts of the output yielded. The first part depends upon the lead or lag, and is independent of the speed; the second part depends upon the deviation from the normal speed, and is independent of the armature position. In parallel running we have, therefore, different outputs, whose algebraical sum must be approximately zero at any instant. Of these outputs one is absorbed in the machine, and two different kinds are yielded up. The difference between the energy transmitted and the total output yielded is represented by the energy transmitted to or drawn from the flywheel at any moment. It is obvious that exchanges will occur among the different outputs, which exchanges will vary widely according to the given conditions. In examining the phenomena it will be best to take simple cases first.

Let us assume that the output of the driving engine is constant and that no damping exists, as is the case with turbines. If, now, for any reason—for instance, an error of judgment in paralleling—a lead occurs, the output yielded will exceed the input at that moment. The flywheel is called upon to make up the deficit by yielding up the necessary energy at the expense of the speed. Although the lead is thus eliminated, the speed has now become too low, and a lag must consequently arise. But this is tantamount to reducing the load on the machine, and tends to an acceleration of the speed, so that the latter is gradually corrected, the proper speed being maintained when the amount of lag corresponds to a certain value.

The oscillations of the revolving part of the alternator round the normal position may be compared to the action of a pendulum. As with the pendulum kinetic energy is converted into potential energy and inversely. We have alternately an increase and decrease of kinetic energy, and corresponding to these changes a decrease or increase of the energy transferred to the mains. Further we have a potential energy which is proportional to the lead. By means of the lead the machine is enabled to do certain work, whereby the lead is gradually eliminated. This conversion of energy from potential to kinetic takes place in a period which may be termed the periodic time of the revolving part. This cycle, as in the case of the pendulum, is proportional to the square of the moment of inertia and inversely proportional to the square of the moment of synchronism. The length of swing—that is to say, the value of the lead—is determined by exterior causes. Just as we may give a pendulum a greater or lesser length of swing at will, the length of swing in regard to the lead is governed by chance irregularities in the driving.

Should there also be damping, then a new source of energy will be present proportional to the variation of speed. Thereby the cycles will be more or less hindered in their succession. Whereas previously a lead had as its only result an increase of the speed of the armature above the normal, we now obtain as a second consequence a direct increase of the output yielded. This also occurs when, perhaps, there is no lead. Thus we obtain in the damping a means of eliminating the oscillations more or less quickly, and in so far the damping is always useful. When opposed by a very strong damping, the oscillations of the moving parts are entirely prevented.

(To be continued.)

Electric Tramways Construction and Maintenance Co.—The petition of E Horton and others, creditors, for the winding-up of this company has been ordered by Mr. Justice Byrne to stand over till next sittings, negotiations being in progress for the sale of orders for the construction of certain proposed tramways.

UNIPOLAR MACHINES WITHOUT IRON.*

The writer had two models of unipolar machines without iron made up, one being a motor and the other a generator. The former rotates due to a purely electrodynamic force when current is supplied to it. The latter delivers a current due to electromagnetic induction. As the inducing field was produced by an exciting coil, it was possible, partly by calculation and partly by measurement, to determine the flux for various positions of the circuit, and some interesting conclusions as to the action in unipolar machines could therefore be drawn.

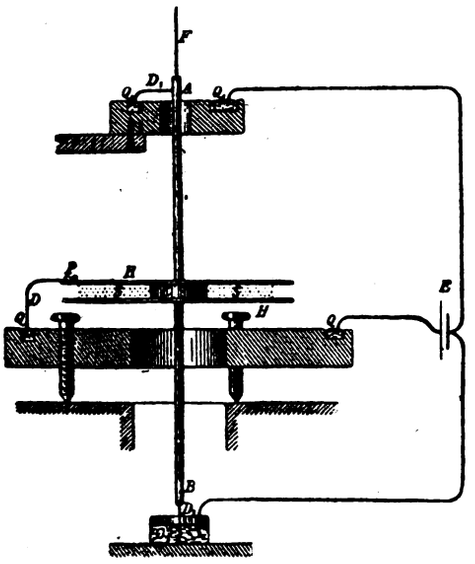

FIG. 1.

Fig. 1 shows the construction of the motor diagrammatically. The brass cylinder, A B, carries a brass disc, C, metalically connected to it. On this the coil, C, is wound between hard rubber flanges, H H. One end of this coil is connected to C and the other to the screw, P. The current comes from the source, E, to the mercury trough, Q, passes up the bent wire contact, D, into the coil and on to C, and then back to the source, E, through both ends (A and B) of the spindle. The motor rotates continuously on closing the circuit—a current of 20 amperes passing. The direction of rotation is independent of the direction of the current. In the case in question the rotation was counter-clockwise looking from above, exactly as would have been the case if a permanent magnet were employed.

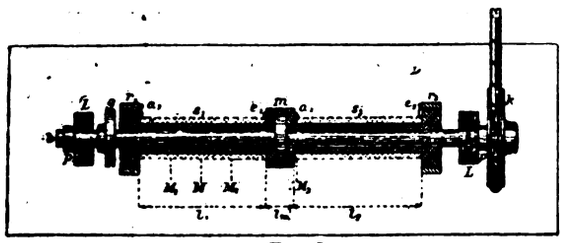

FIG. 2

The generator is shown in Fig. 2. Two coils, s_1 and s_2, wound in the same direction, are carried on the brass spindle, $b\,b$. Current is passed through these coils from a battery by means of the slip rings, r_1 and r_2. The induced current is collected at the brass discs, m and g, by means of contact springs. On connecting a mirror galvanometer between these two contacts, and rotating the apparatus by means of the cord k, a current is indicated which has the same direction relatively to the exciting field as in the case of an ordinary machine.

If the machine is rotated in the same direction as that of the current in the coils, an induced current flowing in the spindle from g to m is set up. On reversing the rotation, the current direction is also reversed.

In order to bring the measurements into agreement with the calculations, various modifications of existing ideas were necessary.

TRADE NOTICES AND NOVELTIES.

Edgewise Instruments.

The illustrations herewith show a departure made by Messrs. Everett, Edgcumbe, and Co., 151-152, Great Saffron-hill, Holborn-circus, London, E.C., in the manufacture of their

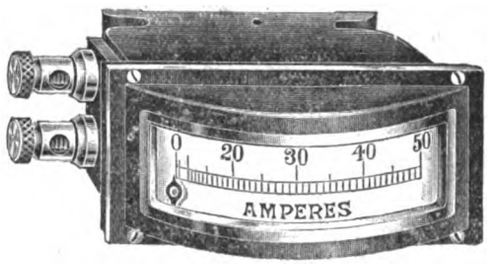

FIG. 1

small ammeters and voltmeters. In these edgewise instruments a scale 4½in. long is obtained—that is to say, of the same length as the ordinary round instruments 7in. or 8in. in diameter—whereas the actual space occupied is only 6⅝in. by ⅞in. The actual saving in space is really considerably greater than these figures would seem to indicate, owing to the fact that from their convenient shape they enormously simplify the setting out of the board, as they can be fitted in between switches, etc., or can be placed horizontally along the top of the board.

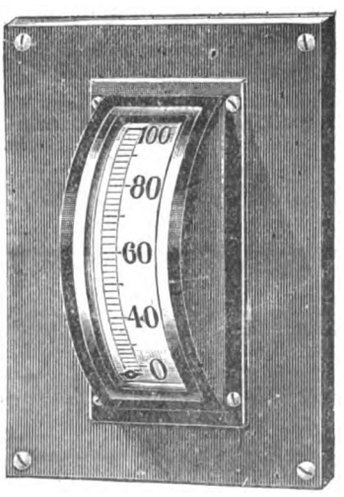

FIG. 2.

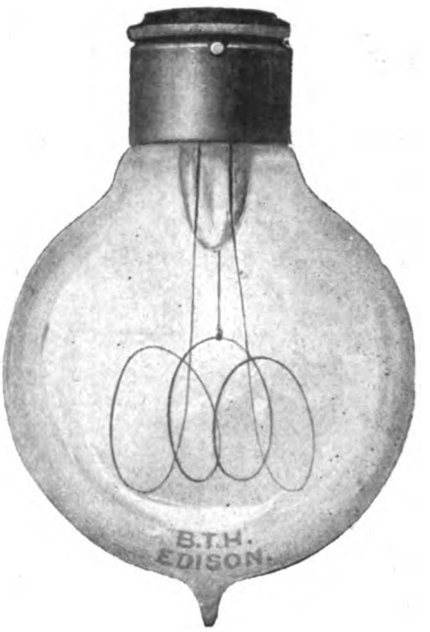
The meters are supplied in two distinct forms either for mounting on the surface of the switchboard (Fig. 1), or for letting into it (flush type, see Fig. 2). Each type can be supplied either with horizontal or vertical scales, as preferred. Messrs. Everett, Edgcumbe, and Co. supply these instruments either of the dead-beat moving-coil type or of their moving-iron type. The latter are fitted with their well-known "air-damping" arrangement, whereby, without any friction whatever, that absolute dead-beatness is obtained which is so essential for motor work. Now that such compact and workmanlike meters are obtainable at a reasonable price, everyone installing an electric motor should make a point of including, if not a voltmeter, at any rate an ammeter, to act not only as a check on the efficiency of the motor and the plant which it is driving, but also as a great preventive of breakdowns.

British Thomson-Houston Round-Bulb Electric Lamps.

For window or other decorations, and for all installations where a short bulb is desirable, the British Thomson-Houston Company supplies a specially-designed round-bulb lamp. As apparent from the accompanying illustration, this lamp is neat and compact, and readily lends itself to artistic treatment. The filament is arranged in spiral form, and is supported by a single anchor, which gives mechanical strength to the carbon without casting shadows or interfering with the life of the lamp. The cap is fixed to the glass with a non-hygroscopic material. This construction renders the lamp suitable for use in damp or exposed places. The round-bulb lamp is 3¼in. long and 2¼in.



in diameter. The efficiency of this lamp for different candle-powers and voltages is given in the following table:

Voltage.	Candle-power.	Efficiency.
100 to 125	8	4 watts per c.p.
100 to 125	16	3·5 ,,
200 to 250	8	4·5 ,,
200 to 250	16	3·8 ,,

LEGAL INTELLIGENCE.

TELEPHONE COMPANY'S POWERS.

On the 23rd inst., in the City of London Court, Judge Rentoul, K.C., heard an application by Mr. Henry Lazarus, Bushey Heath, Herts, for an interim injunction restricting the National Telephone Company, Limited, from disconnecting his telephone.

Mr. Murphy, for the plaintiff, said that the case was of immense importance to all users of telephones, especially as there was a competitive system in the shape of the General Post Office. Plaintiff had been on the telephone for two years, and he paid £3. 10s. a year. Five days before the second year was completed he received a letter from the company saying they intended increasing the charges, and if he did not sign the new agreement sent him he would be cut off. And, much to his inconvenience, he was. Six months' notice should have been given of the intended disconnection.

Mr. Gaine, for the Telephone Company, said they were not bound to give the plaintiff any notice of their intention to cut him off the service.

Judge Rentoul remarked that that was a very strong proposition. Some men would rather remove than be without the telephone. He did not think the company ought to treat the plaintiff as they had done. They ought to give him reasonable time to make other arrangements. At the same time he could not grant the interim injunction asked for as the wires had been severed. There was no means to enforce the Court's order if it were to make one.

ALLEGED DEFECTIVE FITTINGS.

At the Portsmouth County Court, before his Honour Judge Gye, Mr. T. E. Fiford, electrical engineer, of Southampton, sued Mr. Scullard, of Totterdell's Hotel, Portsea, for £75. 3s. 2d., less £35 paid on account, for the installation of the electric light at the hotel. Plaintiff deposed that he put in electric light and bells in 1902, and the fittings passed the Corporation tests. Within a day or a day and

Digitized by Google

a half of the tests being completed, to meet the insurance company's conditions, plaintiff was refused admission. The plaintiff, closely questioned, declared that the wire was properly insulated, and that the work was well and properly done.

Mr. W. S. Foal, superintendent of the Portsmouth Corporation electric supply works, said a test was made at the end of February of last year, but it was not satisfactory. Another test was made, at which he was not present, but his assistant was. It was a test of the insulation, and the assumption was, if satisfactory, there would be no leakage of the wires. It was no part of the duty of the Corporation to pull up the work and examine it.

Mr. C. F. Quick, an electrical engineer, for the defence, said he made a careful survey of the fittings at the hotel alleged to have been made by the plaintiff, and he declared that they were dangerous. It was not indiarubber that was used on the wires for the insulation, but a composition, and he considered the switches very defective. They were of a German make. The whole of the place had to be re-wired.

His Honour gave judgment for plaintiff for £3 on the claim.

LONDON MOTOR OMNIBUS COMPANY.

In the Chancery Division on Friday, Mr. Justice Byrne, in the case of Hart *v.* the London Motor Omnibus Company, Limited, appointed a receiver of the company's property. The plaintiff is a holder of debentures which had become payable; interest was in arrear, and execution had been threatened. Several other actions had also been instituted against the company.

COMPANIES' MEETINGS AND REPORTS.

CITY AND SOUTH LONDON RAILWAY.

The ordinary general meeting of the proprietors of this railway was held at the offices, Finsbury-pavement, on Tuesday, Mr. C. G. Mott presiding.

The report of the directors for the half-year ended June 30 stated that the receipts from all sources for the past half-year amounted to £81,770. 7s. 5d., and the cost of working has been £37,919. 3s. 3d., leaving a profit of £43,851. 4s. 2d. Inclusive of the balance brought forward from Dec. 31 last, the net revenue account shows an aggregate total of £45,378 2s. After making provision for the debenture stock interest, and the transfer to the renewal fund of £1,500, a balance remains available for dividend of £33,006. 9s. 11d. Out of this sum the directors recommended that the full dividend of 5 per cent. per annum be paid on the prefetence stocks 1891, 1896, and 1901, and that a dividend at the rate of 2¾ per cent. per annum be paid upon the consolidated ordinary stock for the half-year, leaving a balance of £1,500. 0s. 11d. to be carried forward to the next account. The directors regret that although the receipts of the line show a small increase over those of the corresponding period of last year, some addition to the expenses, together with a larger amount of interest payable on the debenture and preference stocks, have necessitated a decrease of ¼ per cent. in the dividend. The appeal in respect to the compensation to be paid for the site of the station under St. Mary Woolnoth Church having been decided against the Company, an order was made that the whole amount awarded should be paid into court together with the accumulated interest, amounting in the whole to £89,904. 4s. 3d. (in addition to £81,350 already paid into court), and this has been done, the necessary funds having been raised by the issue of preference and debenture stocks. The questions involved being of such great importance to the Company, the directors propose to carry the case to the House of Lords, where they hope they may obtain a more favourable decision.

The Chairman stated that the Bill which the Company had obtained this session for the extension of the line to King's Cross, St. Pancras, and Euston, including the transfer of the undertaking of the City and Brixton Railway to the Company, had not yet received the Royal assent, and therefore no business would be proceeded with under the notice which had been given that day for the extraordinary general meeting. He reminded the proprietors that when they met a year ago the directors were able to recommend an increase in the dividend over that for the corresponding period of the year before of no less than 1¼ per cent. This large increase was due, in the first place, to the extension to Islington, but also very considerably to the fact that the horse tramways were at the time being reconstructed so as to be worked by electricity. The Company this year had not benefited as they did a year ago by the interruption to the tramway service; on the contrary, they had to meet very considerable opposition from the improved working of the tramways. The result had been that a great deal of traffic—and especially short-distance traffic—had been attracted away from their railway for the time being. When he stated that nearly half of the fares taken by the electric trams did not exceed ½d. for each person, it would be understood that the competition with the railway was very keen, none of their own fares being less than 1d. He moved the adoption of the report and accounts.

Mr. C. S. Grenfell seconded the motion, which was carried unanimously.

GENERAL ELECTRIC.

The ordinary general meeting of the shareholders in this Company was held on Friday at the offices, Queen Victoria-street, Mr. G. Byng presiding.

The report of the directors for the year ended March 31 last states that the net trading profits and income from investments, etc., amount to £94,381. 14s. 4d.; less loss at Witton works, £20,001. 11s. 7d.; leaving £74,380. 2s. 9d. After deducting depreciation and debenture interest, amounting to £22,349. 0s. 7d., there remains a balance of £52,031. 2s. 2d., out of which the dividend on the preference shares at the rate of 5 per cent. for the year has been paid, absorbing £12,500, leaving an available balance of £39,531. 2s. 2d. The directors recommended that this sum should be appropriated as follows: payment of managing directors' and employés' bonus, £3,953. 2s. 2d.; dividend on ordinary shares at the rate of 5 per cent. for the year ended March 31, 1903, £14,419; reserve account, £21,159. The reserve account stands in the accounts at £39,051. 2s., being the amount of undivided profits as at March 31, 1902. The proposed appropriation of the undivided profit of the year ended March 31, 1903, amounts to £21,159, giving a total of reserve account of £60,210. 2s. The trading profit derived from the general business of the Company has shown an increase in almost every department, and the net result must be considered satisfactory. On the other hand, the establishment of the new works at Witton, involving the teaching and training of new workpeople and entailing expenses inseparable from the creation of a new industry in this country, has occasioned a loss during the first year's working. The directors have thought it prudent to write off the whole of such loss this year. Nevertheless they have, by reducing the dividend on the ordinary shares, still been able to place an amount to reserve that is up to the standard of previous years. The engineering works at Witton are now well provided with orders, and there are indications that they will add materially to the profits of the Company in the coming year. During the year further 2,422 ordinary shares have been allotted to the directors of the Company and members of the staff at par.

The **Chairman**, in moving the adoption of the report, said that the feature of the balance-sheet was that all the money obtained when the Company was formed, and also some of the profits, had now been invested for the purpose stated in the prospectus—for building up a large manufacturing establishment at Witton, near Birmingham, in addition to the London and Manchester works. The item of £83,558 was almost entirely composed of additions to the buildings and plant at the works there. The Board had so far spent upon the Witton works about £250,000, and had created factories which in some respects compared with the best in England. To the large engineering and carbon works they had added during the year the extensions to the ironfoundry and the tube works. He regretted that the Board had to record a loss of £20,000, which considerably reduced the profits to be divided. This loss had occurred at the Witton works. The major part of this sum was due to exceptional circumstances, and really in no way detracted from the fact that the works themselves were in good condition. No fear need be felt of a recurrence of such a loss. The largest amount of the Witton deficit came from the carbon works, and it was mainly due to what must be called unfair foreign competition. The Company were making carbons even better in quality than the German production, and the three largest foreign manufacturers had now decided to reduce their prices to a level which would be unremunerative to the Company, and, with a view of killing the British manufacture, they were prepared to work at a loss to themselves in this country until they had achieved their object. The Admiralty, the War Office, and many other Government and public bodies had assured the Company of their support in spite of the price regulated in the way he had mentioned, and with this help, and the fact that they were able to obtain the raw material at a lower price than the Germans could obtain it, he still trusted to be able to keep the carbon factory going until the time came when the country saw the folly of free imports directed solely against the English manufacturer. The Company's experience in carbons must prove to anybody that to establish a new industry in this country was practically an impossibility under the present system. He hoped sincerely that manufacturers would eventually obtain their legitimate share in both the home and the Colonial markets. When that happened shareholders might see their large works extended enormously, and the number of their workmen, which now reached about 6,000, doubled very shortly.

Mr. Max Byng seconded the motion, which was adopted.

The **Chairman**, in reply to questions, said that the carbon works would in time have to be shut up unless the Company obtained protection.

EASTERN TELEGRAPH.

The general meeting of the shareholders in this Company was held at River Plate House, Finsbury-circus, on Wednesday, Sir J. Wolfe Barry presiding.

The **Chairman**, in moving the adoption of the report (*vide* last issue), said it should be clearly understood that the increase in the receipts was not owing to the reductions in the rates; in fact, the effect of these reductions in themselves was—at least at present—in precisely the opposite direction, for with the exception of the Cape joint-purse traffic, there was a considerable reduction in the amount received during the half-year from the places which had benefited by the reduced rates. One of the strong features of the Company was the variety of sources from which their revenue was derived. If there were a temporary reduction in the receipts from one or more sources, owing to reduced rates or other causes, there might be a corresponding increase in some other direction which enabled the Company, as in the half-year under review, to maintain their revenue. The Board had for some time been impressed with the necessity of the Company's being in the forefront of scientific developments in cables and cable instruments, and they decided, in conjunction with the Boards of the associated companies, to offer to Sir Oliver Lodge the post of consulting scientific adviser—a position which, he was glad to say, Sir Oliver Lodge had accepted. The whole of their present power to issue further capital was £168,685. The Board knew of nothing at present to necessitate any increase in this power, but, judging from past expe-

Digitized by Google

rience, submarine cable enterprise developed rapidly, and it might, perhaps, be advisable before very long to ask the stockholders to grant them some little further power to increase the ordinary and preference capital, as well as the 4 per cent. mortgage debenture stock. The International Telegraph Conference was held in London from May 26 to the 10th inst., when various rules and regulations were discussed and amended, and some tariffs were revised, but the revenue would not be materially affected by any of the revisions adopted at the conference. He had nothing to add to what he had said on former occasions respecting the subject of wireless telegraphy, which the directors had always thought would not rival, but would prove a useful adjunct to submarine telegraphy. The Company had installed the system on some of their ships, and had found it useful. He next referred to the fact that after prolonged negotiations the Eastern Extension Company had come to a provisional understanding which, although necessitating considerable concessions, would bring them into intimate and satisfactory business relations with the Commercial Pacific Company. The latter's cable was open for traffic between Manilla and the United States on the 25th inst., and various reductions in the tariff by the Company's route were brought into force on the 15th inst. These reductions would no doubt have a considerable effect on the revenues of the associated companies, but he believed that they would in the long run not only prove of the greatest possible advantage to the telegraphing public, but that they would also put the companies on a very firm and solid basis in the Pacific Ocean.

Sir J. Denison-Pender seconded the motion, which was unanimously adopted.

NATIONAL TELEPHONE.

The ordinary general meeting of the shareholders in this Company was held at Hamilton House on the 23rd inst., Sir Henry Fowler, M.P., in the chair.

The **Chairman**, in moving the adoption of the report (*vide* issue of 17th inst.), stated that the net result of the half-year's working was a profit balance of £377,994. At their meeting six months ago he stated that the amount paid by the Company to the Post Office for royalties was £154,000 for the year 1902, and for the past half-year they had had to pay £81,930, which was a heavy burden on their income. The profit balance was £32,783 more in the past half-year than in the corresponding period of the previous year, but as they had had to pay £6,165 more to the Post Office the net increase in the Company's income was £26,618. The rentals carried forward for unexpired terms of running contracts amounted to £874,383, against £821,397 a year ago. The available balance of revenue was £239,748, out of which the directors proposed the payment of the half-yearly dividends on the first, second, and third preference shares, 6 per cent. per annum on the preferred stock, and 5 per cent. per annum, compared with 4½ per cent. hitherto, on the deferred stock. Their position was satisfactory both as to their plant and their staff. In the past half-year they expended on entirely new work £334,115, in addition to many thousand pounds more than the amount spent in the June half of 1902 in maintaining the efficiency and the full value of the existing plant. In a company like theirs everything depended on this being done, and as there was, perhaps, a more rapid depreciation in telephone plant than in many other plants, the directors intended, in order fully to maintain it, to continue to take large sums from revenue. The business of the Company in London was increasing very considerably, as was also that of the Post Office, and the present arrangement justified what had previously been said at their meetings—namely, that there was room in London for the systems both of the Post Office and of the Company. The number of their telephone messages—taking the call and the reply—reached the enormous figure in the past half-year of 922,875,000, compared with 787,311,000 in the June half of last year, while the number of the home telegrams of the Post Office for the year ended March 31, 1902, was 82,000,000. He thought that these figures gave an admirable summary of the Company's progress.

Mr. George Franklin (Sheffield) seconded the motion, and it was unanimously adopted.

EDMUNDSON'S ELECTRICITY.

The ordinary general meeting of the shareholders was held on Thursday last week at the offices, Broad Sanctuary-chambers, Westminster, Mr. Francis E. Gripper presiding.

The **Chairman**, in moving the adoption of the report, stated that the total profits from the various sources named amounted to £56,954, to which had to be added the balance of £6,179 brought forward. After paying the interest on the debenture stock and the dividends upon the preference shares, and after allowing for the interim dividend upon the ordinary shares, £37,257 remained to be dealt with. The Board recommended that £5,000 should be written off the goodwill account, that £9,274 should be added to the reserve fund, and that a dividend at the rate of 9 per cent. per annum for the half-year should be paid on the ordinary shares, making a total distribution of 7 per cent. for the year. This would leave £11,733 to be carried forward. That amount was larger than usual, but the directors felt sure that the shareholders would approve the Board's policy of conserving the resources of the Company as much as possible in the early years of their existence. During the year issues had been made of 20,000 preference shares and £40,000 debenture stock, and the premiums received on these issues, amounting to £16,725, had been added to the reserve fund. Including the sum proposed to be carried from the revenue account, the reserve would now be increased from £14,000 to £40,000. The fresh capital which had been raised had been required for the completion of new works and the necessary extensions of those already existing. Since the last report the Company had opened new electricity works in nine fresh towns. There were now 28 central stations actually at work, and during the year the increase in the lamp connections had been over 163,000, with an additional 38,000 applied for and waiting to be dealt with. The most important new work in view was in connection with the Lancashire Electric Power Company.

Mr. W. R. Davies seconded the motion, which was carried.

DUBLIN UNITED TRAMWAYS.

The half-yearly meeting of the shareholders in this Company was held in Dublin on Tuesday, Mr. William M. Murphy presiding.

The **Chairman**, in moving the adoption of the report, said the most interesting and the most encouraging item in the accounts was the continued increase in their receipts. This increase amounted in the half-year to £5,610. The traffic receipts actually increased by £5,749, but there was a falling off of £234 in the advertising receipts, but this reduction was owing to temporary causes, and the directors hoped not only to recover the loss, but to increase the receipts under this head. Looking back a year, the receipts for the last half-year were £10,730 more than they were two years ago, indicating a steadily progressive business. The company had effected a saving of £1,093 in the cost of generating electric current. Under the head of general maintenance there was an increase of £2,754, the increase in the cost of car bodies, car trucks, and electrical equipments accounting for £1,467. The maintenance of the engines, electrical plant, boilers, etc., at Ringsend exhibited a small saving, and there was an increase of nearly £400 under the head of buildings, which was occasioned by making good the effects of the great storm of February last. The increase of £760 in the maintenance of the overhead line was largely due to the same cause. The increase of the traffic expenses of £874 was nearly all in the item of wages, and this was duly accounted for by the fact that the mileage covered by the cars was more than 50,000 miles in excess of last year. The most serious increase in their expenses, amounting to £3,230, was to be found in the account for "general charges." The greater part of this increase—namely, £2,125—was due to rates and taxes, which reached within a few shillings of £10,000 for the half-year.

Mr. Percy Bernard seconded the motion which was adopted.

DIRECT UNITED STATES CABLE.

Presiding over the general meeting of the shareholders in this Company at Winchester House, E.C., on Tuesday, **Mr. E. M. Underdown, K.C.**, said that for more than a year the Company had had no expenses for repairs, and in this it was extremely fortunate, but this state could not be expected to continue, and renewals and repairs would have to be made from time to time. During 26 years the Company had received £255,532 in interest on the reserve fund account, or an average of £9,828 per annum; repairs had absorbed £228,829, or an average of £8,800, which was less than the interest obtained on the reserve fund, so that what was earned was clear profit to the business. Another favourable feature was that during repairs and interruptions the Company retained its same earnings during the first year owing to the fact that it shared in the earnings of the pool companies. With regard to Marconi and other wireless telegraphic systems, he never did, and did not now, think that they were to be taken seriously in regard to traffic across the Atlantic. Shareholders need not be under any apprehension in that respect. The International Telegraphic Conference had been held in England, and the results had not in any material degree affected the position of the Company.

The report was adopted.

ANGLO-AMERICAN TELEGRAPH.

The report of the directors states that the total receipts from Jan. 1 to June 30, 1903, including the balance of £1,706 brought forward from the last account, amounted to £184,461. The traffic receipts show an increase of £9,297 as compared with the half-year ended June 30, 1902. The total expenses for the half-year, including the repair of cables, etc., amounted to £65,893, being an increase of £6,962 as compared with the corresponding period of 1902. The cost of repair of the 1873 cable to June 30 amounting to £12,190, has been charged to the renewal fund. The directors, under the powers conferred upon them by the articles of association, have, before declaring the net profits, set apart the sum of £12,000 to the renewal fund, leaving a balance of £106,468. One quarterly interim dividend of 15s. per cent. on the ordinary stock and of £1. 10s. per cent. on the preferred stock was paid on May 1, 1903, absorbing £52,500, and a second quarterly dividend of 15s. per cent. on the ordinary stock and £1. 10s. per cent. on the preferred stock, amounting to £52,500, will be paid on Aug. 1, 1903. The balance of £1,468 will be carried forward to the next account. The cables and land lines of the Company are in good working order.

WATERLOO AND CITY.

The report of the directors for the half-year ended June 30 last states that there had been no change in capital account during the half-year. Gross receipts, less Government duty, amounted to £17,438, and the working expenses to £8,022, being at the rate of 46 per cent., as compared with 44 84 per cent. for the corresponding period of 1902 The balance available for dividend, after providing for interest on debenture stock, is £8,945, and a dividend at the rate of 3¼ per cent. per annum on the ordinary stock is recommended, leaving £170 to be carried forward. The number of passengers carried during the past six months, exclusive of season-ticket holders, was 2,281,133, showing an increase of 41,739 over the number carried in the corresponding period of 1902. The season-ticket holders on June 30 last numbered 1,244, as against 1,197 at the end of June, 1902.

NEW COMPANIES REGISTERED.

Bath Electric Manufacturing Company, Limited.—Capital, £15,000. Objects: to adopt an agreement with H. V. Kramer and J. A Steven; to acquire and turn to account certain inventions in relation to electric motor controllers and resistance material, and the patent rights for such inventions, and to carry on the business of electrical engineers, electricians, etc.

Automatic Circuit Breakers, Limited.—Capital, £100. Objects: to acquire and take over the rights and obligations of H. J. Swirles, H. Swanton, and R. Starke, under an agreement between the said H. Swanton and R. Starke, and to carry on the business of electrical and general engineers, manufacturers of, agents for, and dealers in circuit breakers, dynamos, engines, electrical appliances, etc.

Electrical Engineering Company of London, Limited.—Capital, £1,000. Objects: to construct and maintain cables, wires, accumulators, lamps, and works; to generate and supply electricity; and to carry on the general business of electricians, electrical and mechanical engineers, manufacturers of and dealers in electrical apparatus, suppliers of electric light, etc.

Reliance Electric Company, Limited.—Capital, £1,000. Objects: to carry on the business of electrical and mechanical engineers, electricians, suppliers of electricity for light, heat, power, or otherwise, etc.

British Tramways and General Construction Company, Limited.—Capital, £300,000. Objects: to carry on the business of financiers, concessionnaires, capitalists, owners and workers of railways, tramways, electric light, traction, and power works, etc.

Torquay and District Motor Omnibus Company, Limited.—Capital, £10,000. Object: to provide a service of motor omnibuses for Torquay and district.

British Electric Separating Company, Limited.—Capital, £6,000. Objects: to acquire the business of tin strippers carried on at Swansea by H. A. Leaver as H. A. Leaver and Co., and to carry on the business of stripping tin from tinplate scrap and other articles by electricity or otherwise, and any other business connected with the electro-deposition of metals.

PERSONAL.

Engineers generally and tramway engineers in particular will join with us in congratulating Mr. A. Baker, general manager of the London County Council tramways undertaking, on his appointment to a similar position under the Corporation of Birmingham. In securing Mr. Baker to advise them in carrying out their scheme for electrifying the city tramways, the Corporation of Birmingham have accomplished a master stroke, and by his new appointment Mr. Baker will increase his salary from £1,000 to £1,500 per annum. During the time he has filled the responsible position of manager of the London County Council Tramways Department, Mr. Baker has proved himself to be an excellent administrator. His reputation as a tramway manager was made at Nottingham. Entering the service of the local company in 1878, he succeeded in bringing prosperity to the concern, so much so that the shares during the period of his managership rose from 50s. to par—*i.e.*, £10. He continued to control the undertaking when the municipality took it over from the company, and was responsible for the conversion of the lines from horse to electric traction. Mr. Baker has been with the County Council since 1899, so that a good part of the work consequent on the decision of the County Council to electrify their lines has fallen upon his shoulders, and his success in this direction specially recommend him to Birmingham, where a similar decision was recently come to. We wish Mr. Baker all success in the onerous and responsible duties which lay before him.

We understand that the Bradford Tramways Committee propose to increase the salary of Mr. C. J. Spencer, tramways manager, from £500 to £700 per annum, with a yearly advance of £100 for three years.

Owing to the illness of Mr. D. Scott, traffic manager in the tramway department of the London County Council, whose salary is £550 a year, the Highways Committee propose to terminate his engagement as from Dec. 31 next.

Messrs. A. H. Sears and T. W. Graves have been appointed electric inspectors under the London County Council at a commencing salary of £175 a year each.

The resignations of Mr. G. H. Rhodes, chief assistant in the electric lighting department, Birkenhead, and Mr. D. Williams, shift engineer, have been accepted.

Mr. Joseph Wilkinson, M.I.E.E., who has been in charge of the tramway power station at Hull for some time, has been appointed tramway electrical engineer at a salary of £300 a year under the direction of the city engineer.

Mr. R. L. Horsfall, chief clerk in the tramways department of the Bradford Corporation, has received the appointment of general manager of the Walsall tramways.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Edinburgh.—The Corporation are prepared to receive tenders for the supply of arc-lamp posts. Tenders by Aug. 3. Advertisement in last issue.

Pemberton.—Tenders are invited for the electric lighting of St. John's Church. Particulars can be obtained from Mr. J. Baynes, 618, Ormskirk-road, Pemberton.

Brighton.—The Town Council invited tenders for the supply of meters for a period of one year from Sept. 1, 1903. Tenders by Aug. 10. Advertisement in last issue.

Halifax.—The Corporation invite tenders for the supply of an additional feeder cable, ·8 square inch, ·4 square inch, ·8 square inch sectional area. Tenders by 12 noon on Aug. 4.

Accrington.—Tenders are invited for the electric lighting of new Wesleyan Sunday School. Specifications can be had from Mr. Pollard Barlow, 6, Hest-bank, Rough Lee-road, Accrington.

Baltinglass (Ireland).—The Guardians are prepared to receive tenders for supplying and erecting electric bells throughout the workhouse, amounting to about 12 in all. Tenders by Aug. 8.

Barton-on-Humber.—The Urban District Council invite tenders for lighting the town by gas or otherwise from Aug. 30 next to May 31, 1904. Information can be had at the Clerk's Office. Tenders by Aug. 3.

West Ham.—The Borough Council invite tenders for traction switchboard, etc. Particulars from Borough Electrical Engineer, Abbey Mills, West Ham. Tenders by 4 p.m. on Aug. 21. See advertisement.

Middleton (Lancs.)—The Corporation invite tenders for the supply and erection complete at their electricity works of a grease extractor. Particulars may be obtained from Mr. S. Pauls, borough electrical engineer. Tenders by Aug. 11.

Swindon.—The Corporation invite tenders for the supply, delivery, and laying of all the rails, points, crossings, and accessories for the permanent way of the Corporation's tramways. Particulars from the engineers, Messrs. Lacey and Sillar, Manchester and Westminster. Tenders by Aug. 26. See advertisement.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Launceston (Tasmania).—The Mayor and Aldermen invite tenders for the supply of 500 or more electric meters. Particulars may be obtained on application to Mr. William Corin, city electrical engineer, Launceston, Tasmania, or to Messrs. John Terry and Co., 7, Great Winchester-street, London, E.C. Tenders by Sept. 28.

Aldershot.—The Urban District Council invite tenders for the supply and erection at the sewage works of two 4in. motor-driven centrifugal pumps; also generator, battery, and automatic starting switch s. Particulars may be obtained at the office of the Engineer and Surveyor to the Council. Tenders by Aug. 4. Advertisement in last issue.

London, S.W.—The London County Council invite tenders for the supply and delivery of two low-tension feeder switchboards, and for the erection of one of them in each of the Council's sub-stations at Camberwell and New Cross respectively. Particulars may be obtained at the County Hall, Spring gardens, S.W. Tenders by 10 a.m. on Aug. 11.

Rochdale.—The Corporation invite tenders for the supply and delivery of 16 double-deck, double-truck cars, 20 double-deck, single-truck cars, and five single-deck combination cars, with all trucks, motors, and accessories. Particulars from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster, and 78, King-street, Manchester. Tenders by Aug. 10. Advertisement in last issue.

Madrid.—The Posts and Telegraphs Department require tenders for the supply of 25 telegraph apparatus of the Hughes system and 25 motors with weight elevators for the same, for the service of the telegraph stations of the State, at the upset price of 2,530 pesetas, or about £73, for each apparatus with its accessories as detailed, and 408 pesetas, or about £12, for each motor with its corresponding elevator.

Cheadle.—The Urban District Council are prepared to receive tenders for the supply of materials and execution of works in the laying of concrete foundations, fixing rails, points and crossings for the tramway permanent way complete, including taking up present macadam and paving setts, but except fixing bonding. Particulars may be obtained on application to Mr. Chas. R. Brady, A.M.I.C.E., 13, Warren-street, Stockport. Tenders by 12 noon on Aug. 17.

Northampton.—The Corporation are prepared to receive tenders for the supply, delivery, and erection of the following in connection with the Corporation electric tramways: (Section No. 1) boilers, steam, exhaust, and water piping, condenser, cooler, water-softening plant, mechanical draught, etc.; (2) steam generators, dynamos, battery, and booster, switchboard, travelling crane, station lighting, etc; (3) overhead trolley equipment; (4) underground feeders, pilot, and telephone wires; (5) cars; (6) permanent way; (7) power station buildings; (8) car-sheds, workshops, offices, etc. Particulars on application to the borough engineer, Mr. Alfred Fidler, A.M.I.C.E., Guildhall, Northampton. Tenders by 12 noon on Aug. 15.

RESULTS OF TENDERS.

Swindon.—The Corporation have accepted the tender of Allbright and Co., Swindon, for the wiring of the technical school, at £325. 10s.

Nelson.—The Tramways and Electricity Committee have accepted the tender of Messrs. Dick, Kerr, and Co., of Preston, for the supply of two new single-deck cars.

Rochdale.—The Tramways Committee have accepted the tender of Armstrong, Addison, and Co., Sunderland, for the supply and delivery of creosoted beech paving blocks.

Digitized by Google

Beckenham.—The Urban District Council have accepted the tender of the British Westinghouse Electric and Manufacturing Company for electric meters, at £492.

Ealing.—The Corporation have accepted the tender of Mr. J. Harvey for pipework required in connection with the new boiler and cooling tower at the electricity station, at £908.

Ipswich.—The Corporation have placed an order with the British Westinghouse Company, Manchester, for one watering and track-cleaning car, complete with all necessary electrical equipments.

London, N.—The St. Pancras Guardians have accepted the tender of Barlow Bros. and Co., Shaftesbury-avenue, W.C., for wiring for the electric light to Highgate Workhouse Infirmary, at £1,093. 12s. 6d.

Hammersmith.—The tender of the Reason Manufacturing Company, Limited, for supplying arc lamps and accessories required in connection with the electric lighting on the new tramway routes is recommended for acceptance at £373.

London County Council.—The Council have accepted the tender of J. Cochrane and Sons, Limited, for the construction of a pier, river wall, and water-condensing pipes in connection with the electricity generating station to be established at Greenwich, at £55,558. 19s. 9d.

Leicester.—The Tramways Committee report having accepted the following tenders: Dick, Kerr and Co., Preston, building and delivering 58 cars for the new electric tramways, £510 each; T. Hutchinson and Sons, Leicester, for the erection of the main car depot in Abbey Park-road, £16,845. 17s. 3d.

Radcliffe. — The Urban District Council have accepted the following tenders for the supply and erection of plant: G. Wolstenholme and Son, Radcliffe, Lancs., steam, exhaust, feed, and water pipes and accessories, £1,620; Crompton and Co., London-wall, E.C., balancer and motor-generator, £645; British Accumulator Company, Victoria-street, S.W., accumulators, £689. 15s.

Hammersmith.—The Corporation have received the following tenders for supplying the pumping plant required in connection with the extension of the condensing scheme at the generating station:

Witting, Eborall, and Co., Limited (accepted)	£1,000
Crompton and Co., Limited	2,543
J. Spencer and Co., Limited	2,622
Lahmeyer Electrical Company, Limited	2,713

London County Council.—Tenders have been received as follows for the wiring and fittings for the electric light and for an electric bell installation at the fire-station in Rotherhithe-street:

Oliver, Clark, and Co. (recommended for acceptance)	£211	0	0
F. J. Coleby and Co.	220	0	0
A. H. Marshall	220	0	0
L. Sunderland and Co.	221	0	0
F. A. Glover and Co., Limited	221	5	0
Alliance Electrical Company, Limited	233	8	6

London County Council.—Tenders have been received for the supply, delivery, and erection of the steelwork for the first portion of the Greenwich electricity generating station, as follows, the quotations having been invited from a selected list of firms:

J. Westwood and Co., Limited, Millwall	£36,808	14	6
Dorman, Long, and Co., Limited, Middlesbrough	39,831	7	4
Horseley Company, Limited, Tipton	41,517	6	5
Fulham Steelworks Company, Limited, London	45,297	0	0

The Highways Committee report that these tenders have been carefully examined by the architect, who was of opinion that the second—namely, that of Messrs. Dorman, Long, and Co.—amounting to £39.831. 7s. 4d., should be accepted, and with this view they concurred. In ordinary circumstances they would have recommended that the lowest tender, that of Messrs. J. Westwood and Co., amounting to £36,808. 14s. 6d., should be accepted, but this firm were not prepared to accept certain of the terms on which tenders were invited, and it was not, therefore, possible for their tender to be considered. The amount of the architect's estimate for the work was £40,500. The committee recommend the acceptance of the tender of Messrs. Dorman, Long, and Co.

Gloucester.—The City Council have accepted the following tenders in connection with the light railways scheme:

General Electric Company (1900), generating plant (including Willans engine)	£3,464	17	4
Summers and Scott, condensing plant and pipework	890	0	0
J. G. Statter and Co., switchboard and instruments	1,174	18	1
Crompton and Co., accumulators and reversible booster (including E.P.S. battery)	1,551	11	0
G. Law, rails and accessories, construction of permanent way (British rails)	47,655	11	2
British Electric Equipment Company, cables, troughs, and feeder pillars (Callender's vulcanised-bitumen cables)	5204	1	7
J. G. White and Co., poles	4,381	5	0
British Electric Equipment Company, overhead line materials and rail bonds, and erection of poles and overhead equipment	2,857	9	10
Brush Electrical Engineering Company, car bodies and trucks	5,417	0	0
Dick, Kerr, and Co., electrical equipment of cars	3,689	0	0

South London "Tube."—In a report presented to the Court of Common Council, it was stated that the City and South London Railway Company's Bill for extending their line from the Angel at Islington to Euston, and for taking over the powers of the City and Brixton Railway Company, had been passed by Parliament.

BUSINESS NOTES.

TRACTION.

Horwich.—The borough engineer has been authorised to obtain tenders for tramrails.

Birmingham.—A company has been allowed to start a service of motor omnibuses in the city.

Ilford.—The electric tramways have been opened for traffic along the main road from the parish boundary.

Birkenhead.—New tramway offices, which have been erected in Laird-street, were formally opened on Tuesday.

Southend.—Next session powers will be sought to widen certain thoroughfares for the extension of the tramways.

Perth.—The Corporation Tramways Confirmation Bill was considered in the House of Commons on Monday, and ordered for third reading.

Leith.—A special meeting of the Town Council has passed the statutory resolution to purchase the Leith tramway undertaking for £60,000.

Rowley.—Drafts of the proposed provisional order for the joint scheme for the construction of tramways have been received by the District Council.

Ashton.—The Board of Trade have consented to the light railway to Ashton on a gauge of 4ft. 8½in. with the maximum width of 6ft. 9in. for the cars.

Lowestoft.—As many as 10,197 persons paid fares for riding on the trams on the opening day last week. The takings for the half-day totalled nearly £60.

Erith.—All opposition to the Erith Tramways and Improvement Bill has been withdrawn, and the Bill has been transferred to the unopposed list in the House of Lords.

Vienna —Steam engines on the Vienna Metropolitan Railway are to be replaced by electric locomotives. The electric trains will be run every 2½ minutes at a speed not exceeding 25 miles per hour.

Llandudno.—At their last meeting the Urban District Council discussed the Colwyn Bay light railway scheme, upon which several recommendations were submitted by a committee and approved.

Cheadle and Gatley.—The Board of Trade have given permission to the District Council to borrow £19,740 to cover the cost of constructing the tramways in the district from Cheadle Heath to Gatley.

Dublin United Tramways Co.—The directors recommend a dividend at the rate of 5 per cent. per annum for the half-year ended June 30, transferring £2,000 to reserve and carrying forward £2,857.

South Staffordshire Tramways.—All opposition in the House of Commons to the South Staffordshire Tramways Bill having been overcome, the Bill has been relegated to the Committee on Unopposed Measures.

New South Wales.—The revenue from the tramways during the June quarter amounted to £194,394, as compared with £164,463 in the same quarter of 1902. The expenditure was £185,735, as against £155,640.

Village Motor Service. — A scheme to connect Brampton, Cumberland, with the North-Eastern Railway by means of a short motor line at a capital cost of £6,100 is being considered by the local authorities.

Nottingham.—The Market-street and Upper Parliament-street section of the Corporation tramways, which was inspected by Major Pringle on behalf of the Board of Trade a few days ago, has now been opened for traffic.

Swansea.—One of the first duties awaiting the Corporation Tramways Committee after the vacation is to invite tenders for the construction of the branch lines. It is expected that the latter will all be in use next summer.

Kilmarnock.—The Commissioners under the Scottish Private Bill Procedure Act have considered an application by the Kilmarnock Corporation for authority to construct electric tramways. The entire cost is estimated at £45,000.

Sutton Coldfield.—As a result of a vigorous opposition by the London and North-Western Railway, a committee of the House of Commons has thrown out the Bill to authorise the Corporation to construct a system of tramways in the district.

Heckmondwike.—A temporary supply of electricity will be required to run the tramways which have been laid down in the district by the British Electric Tramways Company. Negotiations are proceeding with the District Council to this end.

Walsall. — The Tramways Committee report having accepted a tender for relaying the existing tramway track in Lichfield-street and Lower Bridge-street, and for the construction of new lines in Park-street and on the Bridge at an estimated cost of £5,899.

Liversedge.—After his inspection of the Batley tramways on Tuesday, Major Druitt went on to Liversedge and inspected an extension of the British Electric Traction Company's system from Millbridge to Hightown. The extension is about 1½ miles in length.

Central London Railway.—Sir Michael Hicks-Beach has accepted the directorship of the railway rendered vacant by the death of Lord Colville of Culross. The directors have again declared a 4 per cent. dividend, carrying forward £45,000, as against £25,000 last year.

Waterloo and City Railway Co.—The directors recommend the declaration of a dividend on the ordinary stock of the Company at the rate of 3½ per cent. per annum for the past half-year, carrying forward £170. The dividend at June last year was 3 per cent. per annum.

Digitized by Google

Paisley.—Mr. W. M. Murphy has written the local Ratepayers' Committee to the effect that his arrangements are now absolutely concluded, and all the necessary capital has been subscribed. The only delay now will be the delivery of the rails, which have to be specially rolled.

Brighouse.—The Halifax Tramways Committee have decided unanimously, and it has been confirmed by the Town Council, to extend their system from the present terminus at Hove Edge into the centre of Brighouse. The distance of the new extension will be 1 mile 6 furlongs.

Herts.—The County of Hertford Light Railways (No. 1) Order is now in its final stages before the Board of Trade. As to the Light Railways (No. 2) Order (Barnet and Bushey), it has passed through the hands of the Light Railway Commissioners, and will be dealt with by the Board of Trade.

Huddersfield.—A Bill to confirm a provisional order relating to the Corporation tramways came on Tuesday before the Deputy Chairman as unopposed, the measure having already passed the House of Lords. The Deputy Chairman ordered that the Bill be reported for third reading.

Rochdale.—At present the Tramways Committee buy their current at 1·50d. per unit, whereas it costs 1·86d. a unit to the Electricity Committee. There is, however, every hope that with an increased output, consequent on the electrification of the tramways, the cost of generation will diminish.

Ramsbury.—The Central Wilts light railway scheme has been before the Parish Council, and it was decided that the route at present proposed would be of no service to Ramsbury at all. The promoters are to be asked to include in their scheme the villages of Mildenhall, Axford, Ramsbury, and Chilton.

Halifax.—New tramway offices are to be built at a cost of £2,000. An indication of the effect which the electric tramways are having upon the railways is afforded in the case of Halifax. Owing to the severe competition of the trams, the Great Northern Railway have decided to close the Ovenden Station.

Cranbrook.—Notice was received at the last meeting of the Rural District Council from the Rother Valley Light Railway Company of a public enquiry to be held at Tenterden, on July 30, as to their intention to apply for an extension of time for the construction of the line from Cranbrook to Tenterden.

Brighton.—The Corporation Tramways Bill, which has already passed the House of Lords, came before a special committee of the House of Commons on Tuesday. All opposition was withdrawn, and the Bill passed and was ordered for third reading. The cost of the proposed extensions is estimated at £55,000.

Bury.—A special meeting of the Town Council will be held on Aug. 20 "for the purpose of taking into consideration the propriety of giving notice to the Bury, Rochdale, and Oldham Tramways, Limited, requiring the company to sell to the Council so much of their undertaking as lies within the borough."

Bradford.—On Tuesday the Tramways Committee further went into the subject of the proposed amalgamation of the tramways and electricity departments of the Corporation, and in the end they decided to ask the Finance and General Purposes Committee to appoint a special committee to enquire into the subject.

Aston.—The arrangements for the complete electrification of the Aston-Birmingham trams have been considerably advanced during the past few days, and there is now every probability that when the leases fall in on Dec. 31 next there will be very little, if any, delay in changing from steam to electricity as a method of traction.

Wandsworth.—The Borough Council, on the recommendation of the General Purposes Committee, have decided to adhere to their decision to have the Garratt-lane tramway constructed on the conduit system, but in order to save a delay of four years have consented to the other tramways being temporarily reconstructed on the overhead system.

Prestwich.—At a special meeting of the District Council it was decided to ask the Local Government Board to extend the time for the completion of the electric tramways to Sept. 1, 1904. It is intended to continue the line from the main entrance to Heaton Park to Besses-o'-th'-Barn, where it will join the existing tramline from Salford to Whitefield.

Lancaster.—There was a heated discussion at the Town Council meeting on Wednesday on a recommendation of the Tramways Committee to open up a new electric tramway route in the west portion of the town at an estimated cost of £1,610. One gentleman advocated electric omnibuses, and eventually the matter was referred back for further information.

Tees-side.—A conference of representatives of the Middlesbrough Corporation and of the Ormesby and Normanby Councils has instructed Mr. Hammond to prepare a scheme for the purpose of running a tramway between Middlesbrough and the extreme boundary of South Bank *via* Normanby, and to report as to whether such scheme would be remunerative.

Metropolitan District Railway.—Subject to final audit, the accounts will, after paying all prior charges, admit of a payment for the six months ended June 30 last of a dividend on the 4 per cent. guaranteed stock at the rate of £2 per cent. per annum, as against £3 per cent. per annum in the corresponding period of last year, carrying forward £342, as against £1,433 in the corresponding period.

Preston.—The following resolution has been adopted by the Council: "That Messrs. Harding and Co., Limited, be informed that the Corporation purpose that the working of the present tramways under the lease shall terminate with the expiration of the lease—namely, on Dec. 31, 1903—so that the Corporation may have possession of the whole system for the immediate laying of the electric trams."

Hamilton.—The Hamilton, Motherwell, and Wishaw tramways had a most successful opening last week. It was a public holiday in the district, and the company's resources were taxed to the utmost. The weather was delightful, and travelling on the cars was alike a novelty and delight. They run through a most interesting district, at once the busiest industrially and not the least picturesque in the West of Scotland.

Cardiff.—The provisional order relating to the extension of tramways in the town has passed the House of Lords and its second reading in the Commons. Acting upon a requisition signed by five members of the Town Council, the mayor has called a special meeting to reconsider, on Wednesday next, the question of the reconstruction of the tramway from the Monument to Clare-road. An interesting discussion is expected.

Aberdeen Suburban Tramways.—The prospectus of the company promoting this scheme has now been issued. The share capital is £72,000. As the name implies, the proposal is to construct electric tramways on the overhead trolley system in the suburban districts of Aberdeen. The estimated cost of the lines, electric equipment, cars, car-sheds, and the preliminary expenses of obtaining the provisional order is put down at £61,130.

Liverpool Overhead Railway Co.—The accounts of this Company for the past half-year show an available balance of £9,872, and the directors have resolved to recommend payment of a dividend at the rate of 5 per cent. per annum on the preference shares and 1¼ per cent. per annum on the ordinary shares, against 1 per cent. per annum on the ordinary shares for the corresponding period last year. The balance carried forward is £3,747.

Ventilation of the "Tube."—The completion of the air-extracting fan at Shepherd's Bush is announced, and it has commenced running regularly from the small hours of the morning. The fan, which measures 20ft. in diameter, is worked by an electric motor of 160 h.p. The working hours of the air-extractor are from 1.15 a.m. to 4.15 a.m., and during this time it causes a stiff current of air of some 10 knots strong to rush through the whole length of the two tunnels.

Keighley.—The Council are recommended to instruct the borough engineer and the electrical engineer to prepare all necessary plans, sections, specifications, and estimates for reconstructing and electrically equipping the existing tramways, and for the construction of a new electric tramway between North-street and Stockbridge, *via* Cavendish-street and Bradford-road. Application will be made to the Board of Trade for sanction to borrow the money necessary.

Stroud.—A committee of the House of Lords has been considering the Bill promoted by private enterprise for a system of electric tramways between Stroud and Painswick, Chalford, Nailsworth, and Stonehouse. The Bill has already passed the House of Commons, and it will be recalled that the proposal on some of the routes is to run trams by the overhead trolley system but without rails. The committee found the preamble proved, and the Bill will proceed.

Southport.—On Wednesday Major Druitt inspected a unique contrivance in the shape of a one-man electric car, for use on the Birkdale-Southport section of tramways. At the same time he inspected the Trafalgar-road extension of tramways. The new car is controlled by one man—the driver. The passengers enter by the front platform, and place 1d. in a slot. The driver raises a bar, which allows the passenger through, and this shuts off the current temporarily.

Bideford Light Railway.—Colonel Boughey and Mr. Henry Allen Steward, Light Railway Commissioners, have heard the application of Bideford, Westward Ho! and Appledore Railway Company to extend the line on the Broad Quay, Bideford, to near the end of Long Bridge, to make loop lines opposite Trewin's Stores and on the Pill, and to extend the line from Northam to Appledore. The scheme was sanctioned with the exception of the proposed extension on the quay.

Paris "Tube."—A clever engineering feat was accomplished in Paris last week in connection with the extension of the Paris "Tube." Between 6 o'clock and 3 o'clock a bridge 130ft. long, which spans the Seine at Passy, was moved a distance of nearly 80ft. The preparatory work for this difficult operation took about 10 weeks, and when everything was ready the huge mass was moved over wooden rollers by a windlass worked by hand for safety. The operation was completely successful.

Holywell.—The Urban Council have considered an application requesting the Council's support to a Bill to be promoted in the ensuing parliamentary session for power to construct an electric tramway, to run from Sandycroft along the shore to Bagillt, thence to Holywell, Mold, Buckley, and Hawarden. In the discussion which followed the reading of the letter nothing but approval of the scheme was expressed, and a resolution to support the Bill was carried unanimously.

Burton and Ashby Light Railway.—On Monday the Burton and Ashby light railway order, promoted by the Midland Railway Company, for the construction of 11¼ miles of tramways between Burton and Ashby, came before Sir Herbert Jekyll at the Board of Trade for the consideration of objections of the Swadlincote Urban District Council, the Leicestershire Council, and the Burton Corporation. The two latter, however, did not appear. The order as amended will be confirmed later on.

Cape Town.—Further information is to hand in regard to the opposition of the inhabitants of Sea Point and Green Point suburbs as to the proposals of the Cape Town Tramway Company, whose lines run through these places, to electrify the at present disused Sea Point tramway. It appears that the company's service is not considered satisfactory, and the feeling of the ratepayers is that it is undesirable that the possibility of competition should be extinguished, and that the Government should run the line itself.

Digitized by Google

Electric Automobile.—The City and Suburban Electric Carriage Company have built for the town use of the Prince of Wales a four-seated brougham, the body of which hangs specially low on springs of a design which gives great ease and luxury to the passengers. The battery boxes in this carriage are not to be seen, as the batteries are skilfully concealed within the lines of an ordinary horse-drawn carriage. The driver's seat is low, so that the occupants of the carriage have a good view through the glass panel at the front.

Bath.—In connection with the electric tramways which are being laid down in the town, the local authority have passed the following resolution: "That the question of the rebuilding of the Midland Bridge be referred to a joint committee of the Electric Traction and Streets Improvements Committee for further consideration, with instructions to report upon the probable cost of improving the bridge and its approaches, and also for the purpose of furnishing the Council with further information as to the proposed improvements on the tramway routes."

South London.—The traffic returns of the London County Council tramways (including the electrified portion) show that for the week ending July 18 the receipts were £10,674. 19s. 11½d., as against £9,218. 0s. 1d. during the corresponding week of last year. This shows an increase of £1,456. 19s. 10½d. The number of passengers carried was 2,715,905, over a mileage of 397, against a mileage of 265 last year. Counting a period of 109 days, the receipts were £154,870. 1s. 1d., against £134,277. 15s. 10d. last year. This gives an increase of £20,592. 5s. 3d.

Wolverhampton.—It is stated that negotiations are still in progress between a committee of the Corporation and the Lorain Tramways Company. Nothing definite has been decided on as yet. The Lorain Company claim the payment of a large sum if the contract is to be determined, and on the other hand less than half the amount asked for has been offered. The proceedings may be of a prolonged nature, and, failing agreement, the last resource will be arbitration, which, it is feared, will be very expensive. Both sides, however, appear anxious to come to an amicable arrangement.

Burton.—The construction of the Burton electric tram system is now all but complete, and a very satisfactory trial run was made during the early hours of Friday. Later in the morning a special meeting of the Town Council was held to consider certain details in relation thereto, including the settling of the fares and the question of Sunday running. It was decided only to run the cars during the afternoon and evenings of Sunday. The official inspection, on behalf of the Board of Trade, of the tramways was made by Major Pringle and Mr. Trotter on Wednesday. The length of route is nearly six miles.

Additional Traffic Returns.—Anglo-Argentine, £1,371 increase; Barcelona Ensanche y Gracia, £213 increase; Barcelona, £201 decrease; Brisbane, £53 decrease (month of June, £9,575, decrease £612); British Columbia Electric (month of March), gross earnings £10,352, net income £2,658; Buenos Ayres and Belgrano Electric, £23 increase (month of April, £12,995, increase £1,123); Calcutta, £597 increase; Cape Town (month of April), receipts £16,003, expenditure £8,313; Isle of Thanet Electric, £61 increase; Mexico Electric (month of June), recepts £46,270; Perth Electric, £109 increase; Port Elizabeth (month of April), receipts £4,292, expenditure £2,281.

Hull.—Having inspected the sample top covers erected on two of the cars of the Corporation, the Tramways Committee have decided to have the Magrini covers fixed to 13 cars to be supplied under the Westinghouse contract. The city engineer has been authorised to lay the tramway lines in Lowgate, from the town hall to Silver-street, and repave the widened street with hardwood blocks. An unopposed Bill to empower the Corporation to make certain street improvements, to construct additional tramways, etc., came on Tuesday before Lord Morley, chairman of committees, and after proof of preamble had been given by the town clerk, it was sent for third reading.

Greenwich.—The much-vexed question of a tramway from Deptford Bridge to Shooter's-hill *viâ* Blackheath was again before the Council at their last meeting, and it was decided to enquire from the London County Council whether the alternative route from Westcombe-hill to Shooter's-hill *via* Old Dover-road had been under their consideration. The deputation representing the Special Tramways Committee of the Borough Council waited upon the Highways Committee of the London County Council to confer upon the subject of tramways in the borough. We understand that a compromise was suggested in the matter of the borough's contribution to the cost of the widenings which would be necessary for the carrying out of the County Council's schemes.

Middlesex.—At the last meeting of the County Council the Parliamentary Committee reported that the promoters of the Watford and Edgware Railway Bill, had signed an undertaking not to oppose any application made by the County Council within three years for powers to construct a light railway or tramway along the main Edgware-road to Watford-road through Stanmore, unless at the time at which the County Council made the application the company should have provided the capital and commenced the construction of the railway authorised by the Bill. The Light Railways and Tramways Committee of the County Council are considering whether it is desirable to make applications to the Light Railway Commissioners for an order to authorise the construction of a number of light railway extensions in the county.

Barrow.—At the last meeting of the Town Council the delay in commencing the new electric tramways was strongly commented upon, and Alderman Lee suggested that a telegram should be sent to the British Electric Traction Company informing them that the Corporation were greatly dissatisfied with the delay, and asking them to make a start at once. Mr. Dawson said a letter had been received from the British Electric Traction Company stating that 500 tons of the rails which are being made in Belgium had been condemned, but that 300 tons would be shipped very soon. In further discussion it was stated that according to the agreement the company should have commenced operations within three months. The agreement was signed 12 months ago. A proposal was carried that the Council consider in committee whether a mandatory injunction should be applied for to compel the company to begin the work at once.

Aberdeen.—The traffic returns of the Corporation tramways for last week show a decrease of revenue amounting to £349. 2s. 7d., and an increase in expenditure of £127. 3s. 11d. For the past seven weeks there has been an increase in revenue of £912. 7s. 3d., and an increase in expenditure of £991. 19s. 3d. As explaining this unsatisfactory state of affairs a local paper states that the committee are face to face with the whole question of early and late cars and the double shift of men. The early cars, except probably on the Woodside route, are a failure, and the late cars in the evening are run at a distinct loss. Moreover, the double shift of men has added greatly to the expenditure, and the position of matters, as brought out in the returns for the past week, is of such a nature that the whole question of early and late cars and of a double shift of men must be reconsidered if the undertaking is not to show a very serious deficit at the end of the year.

South Africa.—According to *South African Exports*, the scheme of the Lourens River and Estate Company, Limited, to erect and run a system of electric trams from the G.S. Railway Station to Somerset Strand is receiving strong support from the ratepayers. It is stated in Kimberley that the De Beers Company are negotiating with Messrs. Gibson Bros. with regard to the purchase of the Victoria Tramway, in order to secure a service of electric trams throughout the town and to the suburbs. The Sydenham Electric Tram and Lighting Bill has been introduced into the Cape Parliament. The construction of the electric tramways at Lourenço Marques is being rapidly pushed on with, and it is hoped to have the cars running by Christmas. The haulage at De Beers mines at Kimberley is to be replaced by electric traction, and the British Westinghouse Electric and Manufacturing Company have received an order for the supply of a dozen mining locomotives.

New Zealand.—A correspondent says that "the New Zealand Government intends to make use of a powerful waterfall called the Huka Falls, in North Island, for the purpose of obtaining electricity. A Swiss engineer named Alloa, of Berne, has been engaged by the Colonial Government to construct an electric station on the falls, and has already left this country for New Zealand. It is estimated that the electric force which will be obtained will be sufficient to light the principal centres in the North Island and to supply power for the tramway systems. The Swiss engineer is a well-known authority on the question, and has built some of the most important electric installations in this country. It will take a year to complete the new works." The above is practically a repetition of what we were able to state some weeks back, but we believe we are right in saying that the New Zealand Government has not decided upon any particular scheme. A sort of general enquiry is being made on the subject.

Birmingham Tramways Bill.—That portion of the tramway scheme as was left in the Bill by the committee of the House of Lords came on Thursday last week before a committee of the House of Commons. Mr. Fitzgerald, in opening the case for the promoters, said the object of the Bill was to authorise the extension of the existing Yardley tramways from Sparkhill to Olton on the one hand, and from College-road to Shirley on the other hand, for the purpose of meeting the wants of a great and growing population of clerks and artisans who had to go to their businesses and works in Birmingham every day. The two local authorities of Yardley and Solihull were strong supporters of the tramways; in fact, the Yardley District Council were actually promoters of the Bill. The County Councils of Warwickshire and Worcestershire, as the road authorities, both assented to the Bill, and there was not a single landowner or frontager opposing; in fact, the City of Birmingham Company, in promoting these tramways, which when constructed would be a very great convenience to the inhabitants, had at their back the whole public feeling of the district.

Batley.—On Tuesday Major Druitt made an inspection of the electric tramways at Batley, and also of the Hightown (Spen Valley) and Ravensthorpe sections of the Heavy Woollen District lines. Two cars were sent from Liversedge to Batley to meet the inspector and the local officials, but in descending Purlwell-lane, Batley, a rather steep hill, the brake attached to the second car failed to act, and the car ran into the leading car. The driver of the latter sustained injuries to his head. Both cars were damaged, and had to be taken away. Until fresh cars were procured the inspector was kept waiting at Batley, and Mr. O. J. Kirby, the borough surveyor, was standing in the crowd that assembled, when a Bradford man drove up Bradford-road at a quick pace and ran Mr. Kirby down. He was badly shaken and his clothes were torn, but he was able to accompany Major Druitt over the lines. The inspector found the whole of the Batley and Hightown sections satisfactory, and the latter section will be opened at once. The cars ordered for Batley have not yet been delivered, but it is probable that the lines will be opened with cars from the Spen Valley depôt.

Reading.—The electric tramway system which, as noted last week, was opened for traffic on the 22nd inst., has been laid down by the municipality. Altogether 7½ miles of route have been equipped on the overhead trolley system, and over five miles are double track. The permanent way is partly in granite setts and partly in wood blocks. Centre poles with double arms and painted white and green have been erected in the principal thoroughfares, and bracket arms from side poles painted in two shades of green carry the wires on the remaining parts of the route. The cars, 30 in number, are very handsome in appearance and will accommodate 48 passengers, 22 inside and 26 on the top. The generating station stands in Mill-lane. The

Digitized by Google

boilers, of which there are three, with space left for a fourth, are of the Babcock and Wilcox type. A Green's economiser with condensing and oil extracting apparatus have been installed, as well as feeding and condenser pumps. The generators, of which there are four, are each of 100 kw., with an average voltage of 500 volts. The car-shed contains 10 beds for three cars each, and has a hollow floor throughout. The cars are fitted with both hand and electric brakes.

Private Bills.—In the House of Lords on the 23rd inst. the Croydon and District Electric Tramways Bill was read a second time, and the Blackheath and Greenwich District Electric Light, the Watford and Edgware Railway, the London United Tramways, the London, Tilbury, and Southend Railway, the Great Northern, Piccadilly, and Brompton Railway (Various Powers), the Beckenham Urban DistrictCouncil, and the Harrow-road and Paddington Tramways Bills a third time. In the Commons on the 22nd inst. the Tynemouth and District Tramways Bill was read a third time. In the Lords on Tuesday the Baker-street and Waterloo Railway (Extension of Time) Bill was read a third time and passed. In the Commons the following Bills were read a third time: Birmingham District Tramways Bill, Dewsbury, Batley, and Birstal Tramways Bill, Manchester Southern Tramways Bill, and Worthing Corporation Tramways Bill. A number of Tramway Bills, authorising the construction of of tramways in several provincial towns, including Burton-on Trent, Huddersfield, Leeds, Keighley, Horsforth, and Barrow-in-Furness, passed Mr. J. W. Lowther's Unopposed Committee, and were reported for third reading. They have already passed the Lords.

Light Railways Bill.—In the House of Lords, last Friday, Lord Wolverton, in moving the second reading of this Bill, said that when Parliament passed the Light Railways Act of 1896 it treated that measure more or less as of an experimental description, and confined its operations to the period of five years. Since the expiration of that period Parliament had renewed the Act year by year, and the object of the present Bill was to make it permanent, as the Board of Trade considered that it had been a success. This was the effect of Clause 1. Clauses 2 and 3 reformed the procedure. Under the existing Act if the Board of Trade thought a light railway scheme to be of such importance that it ought to be submitted to Parliament, the preliminary work on the order was wasted, and the promoters had to begin *de novo*. Clauses 2 and 3 remedied that state of things. The Earl of Morley thought that the measure was a very useful one, but remarked that there was no doubt that the existing legislation in regard to light railways and tramways was not in a very satisfactory condition, and appealed to the Board of Trade to consider before another session whether they should not introduce a more comprehensive measure which should bring some order into the law. The Bill was read a second time, and on Monday the committee stage was completed.

Blackburn.—Reporting on the working of the tramways department during the past 12 months, Mr. Alfred S. Giles, the borough electrical engineer submits the following statement, showing the revenue and expenditure and the application of the balance in a condensed form: traffic receipts, £40,963. 18s. 4d.; other receipts, £1,215. 5s. 5d.; total revenue, £42,179. 3s. 9d.; working expenses, £25,702. 12s. 1d.; gross profit, £16,476. 11s. 8d. This balance has been applied as follows: interest on loans, £8,914. 13s. 2d.; sinking fund, £11,636. 16s. 7d.—total, £20,551. 9s. 9d.; balance from revenue account, £16,476. 11s. 8d.; financial result (deficit), £4,074. 18s. 1d. The total length of the tramways now owned by the Corporation is the equivalent of 21 miles of single track. The total mileage run during the year was 826,558, and the passengers carried were 7,234,106. The receipts average 11·89d. per car mile. The capital expenditure of the department was £275,651 at the commencement of the year, of which £96,577. 11s. 8d. represents the purchase price paid to the late tramway company. The report concludes by expressing regret at the loss on the year's working, but the engineer is hopeful that, should the revenue increase next year in proportion to the progress achieved during 1902-3, the department at the end of the following year will be in a position to meet all charges.

Leeds.—A comprehensive scheme of ½d. fares on the trams is about to be put into operation. The revision of the hours and wages of the Leeds tramway workers, which the committee governing the municipal system have undertaken, on the application of a couple of trade societies representing every section of the men, is proving a more contentious matter than was at first anticipated. A few weeks ago the Tramways Committee appointed a special sub-committee to revise the general conditions of the men, and the result of their deliberations have been laid before the full committee in the form of a report, recommending briefly a small increase of the men's wages, reduced and regular hours of labour, and generally improved working conditions. These proposals do not find favour with the men, as the following resolution passed at a mass meeting shows: "That this mass meeting of tramwaymen, after considering in detail the programme drawn up by the committee appointed, considers the same in its present form unsatisfactory. The men consider the period of probation from the minimum to the maximum too long. The offer to shedmen and washers is inadequate, and we desire also the deletion of the condition recommended as regards shedmen. We strenuously oppose the bonus system in relation to drivers, and request its deletion, and that a defined wage, irrespective of privileges, be substituted." Matters are assuming a serious aspect, and a general strike is regarded locally as a not unlikely contingency.

Brighton Railway.—Speaking at the half-yearly general meeting of the London, Brighton, and South Coast Railway Company on Wednesday, the Right Hon. Lord Cottesloe (the chairman) said the Board was actively pursuing its enquiry into the subject of electric traction, and a committee of directors had been appointed for its special consideration. The problem was a very difficult one so far as this railway was concerned, by reason of the complication of lines and the intermixing of main and local, or fast and slow, traffic, and it would be obviously wrong to revolutionise the present system of working by the introduction of a new method of locomotion until it was made absolutely clear that advantage, both in greater rapidity of of transit and greater economy and ease of working, would result. Regard must be had also to the competition of other means of transport, and it was necessary for the Board to be assured that electrical traction would be a success from its commercial as well as its mechanical aspect. It was, therefore, advisable to proceed with caution, and, having every desire to arrive at a true conclusion, this was what the directors were going. In conjunction with the London and South-Western Company, they were trying an interesting experiment with a self-contained steam motorcar on the branch line between Fratton and Southsea, and it was hoped that the result would be a saving in working expenses; and the advisability of establishing similar working, either by steam or electricity, on other parts of the company's system was engaging the attention of the Board.

Darwen.—The borough accountant's annual statement includes the following: "The revenue account of the tramways (Darwen section) shows a gross profit of £2,482. 5s. 8d. The charges for interest on loans, instalments of principal repaid Public Works Loan Commissioners, and sinking fund instalments, less bank interest received, amount to £3,591. 10s. 10d., leaving the net loss for the Darwen section at £1,109 5s. 2d. It should be pointed out that this loss includes the sum of £900 debited to revenue account for depreciation. The traffic receipts for the year on this section have been £10,743. 8s. 4d., as against £10,411. 11s 11½d. for the year ended March 31, 1902, showing a gain in receipts of £331. 16s. 4½d. for the year. These increased receipts are accountable to some extent to the increased traffic in consequence of the "Peace" and "Coronation" celebrations of June last year. The revenue account for the Hoddlesden section shows, after debiting to revenue account the sum of £150 for depreciation, a loss of £71. 5s. 10d., to which must be added for interest on loans and sinking fund instalment, less bank interest received, the sum of £740. 10s. 10d., showing a net loss of £811. 14s. 8d. This loss, however, is reduced by the guarantees for the year, amounting to £370, leaving the net loss to be carried to balance sheet at £441. 14s. 8d.. The total amount standing to debit of tramways net revenue account at March 31, 1902, was £262. 12s. 5d., to which the losses for the past year have to be added, leaving a total amount standing to the debit of net revenue account of £1,813. 12s. 3d. The total number of miles run and the average traffic receipts per mile are as follows: Darwen section: 222,329 miles; traffic receipts, 11·5973d. per mile run. Hoddlesden section: 31,951 miles; traffic receipts, 11·6174d. per mile run."

Newcastle.—The extension of the tramways from the present terminus in Tynemouth-road to Wallsend will be opened for traffic to day. This extension will form a connecting link between the Newcastle Corporation tramways and the Tyneside tramways, thus making it possible to travel direct from the city by car to the Tyneside by changing cars where the systems meet. The professional auditor for the Corporation has issued his annual report on the electric tramways undertaking. The amount of loans raised was on March 25, 1902. after deducting £6,771. 19s. 9d. repaid, £683,228. 0s. 3d.; borrowed or transferred during the year, less instalments repaid and accrued, £90,397. 5s. 9d.; and outstanding loans up to March 25, 1903, amounted to £773,625. During the year, capital expenditure amounting to £230,256 has been incurred in connection with the tramways. The revenue account of the tramways shows that the expenditure for the year has been £153,822. 1s. 8d., as against the previous year of £21,171. 4s. 1d. The traffic receipts amounted to £150,334. 5s. 8d. The income derived from public lighting in connection with the tramwas was £3,100; from rents, advertising, and sundries, £387. 16s.; and the balance available for depreciation and interest and redemption of capital is £69,452. 10s. 1d. The amount for interest on and redemption of loans during the period covered by the working of the system is £52,407. 10s. 6d. Deducting this from the surplus, there remains a balance to the credit of revenue account of £17,044. 19s. 8d. available as the nucleus of a depreciation and reserve fund, the further annual provision for which will depend upon the basis decided upon by the Council. The balance to the credit of the sinking fund account, representing loans repaid, amounts to £33,710. 14s., the amount due to the city fund (for advances made during the construction period) after deducting £3,000 repaid is £13,819. 10s. 6d., exclusive of interest, which is in dispute. Included in the assets there appears an item, under the heading of "Interest on and redemption of loans during construction," of £20,098. 2s. 5d., which is to be written off out of revenue, as no power exists to capitalise, as is generally the case in the construction of large undertakings.

Manchester.—On Tuesday the report of the tramways department for the year ended March 31 last was issued. It appears that during the year the Victoria Park, Hyde-road, and Stockport-road, and the southern routes have been opened—over 57 miles, and bringing the total up to 77 miles and 1,611 yards. In the matter of finance, the report states that the total revenue was £317,960. 9s. 2d., against £111,307. 12s. 7d. for the year preceding. Working and other expenses came to £193,989. 11s. 9d., against £64,688. 16s. 5d. The balance, being gross profit, came to £123,970. 17s. 5d.—a leap in 12 months from £46,618. 16s. 2d. With bank and other interest added, the sum available was £126,566. 16s. 5d. Out of this sum £39,968 went in interest on mortgage debt, etc., £8,545 in rent of lines leased by the Corporation, £30,000 was given in relief of the rates, and £39,551 went to reserve, renewals, and depreciation account. Figures are also supplied which show that the operation expenses per car mile are being reduced. In 1901-2 the total spent under this head per car mile was 8·10d., whereas it was only 6·95d. in the year under consideration. The expenses for electrical energy rose from 1·45d. per car mile in 1901-2 to 1·94d. in 1902-3. Traffic expenses have, however, fallen. The cost of salaries under this head has slightly declined. The total traffic expenses per car mile have

Digitized by Google

declined from 4·24d. to 3·53d. Management expenses have also fallen from 1·80d. per car mile to ·75d. Salaries, wages, stationery, and miscellaneous office expenses under this head show the largest reduction, standing at ·81d. in 1902 and at ·28d. in 1903. Repairs and maintenance have cost the committee slightly more this year than last. In 1902 the car mile charges for repairs and maintenance were ·61d.; in 1903 the total was ·73d., the largest item of increase being registered under the head of permanent way. A total car mileage of 6,382,036 was run between April 1, 1902, and March 31, 1903; the number of passengers carried during the year was 66,849,457; the receipts amounted to £306,249. 15s. 8d.; while the average receipts per car mile were 11·52d. The committee have had under consideration the fares on all the routes, and, guided by the experience they have gained, they have decided to make some important alterations. The main principle is to introduce between the 1d. and the present 2d. stages a 1½d. fare, between the 2d. and 3d. stages 2½d. fares, and so on according to the length of the routes. The 1½d. fare will really supersede the present 2d. fare. In addition to the 1½d. fare the committee will introduce 1d. fares for from the middle of the first stage to the 1½d. stage. All the revised fares will, it is expected, come into operation on Oct. 1.

London County Council.—At the meeting of the above body on Tuesday, the Highways Committee expressed their regret that they had to report that there had been several cases lately of persons maliciously inserting pieces of metal and wire in the conduits on the Westminster-to-Tooting tramways, the result of which had been to create short-circuits, the tramway traffic being in consequence seriously interfered with. This malicious interference with the conduit, in addition to hindering the smooth working of the tramways, and causing numberless delays, is likely to endanger the safety of the passengers on the tramcars; and the committee have therefore arranged for the issue of a notice offering a reward of £25 to any person who may supply such information as will lead to the conviction of the offenders, and they hope that this course will effectually stop so dangerous a practice. Another report presented by the committee recorded the fact that the District Railway Company intend to lay electric mains between the Lot's-road power station at Chelsea, along Fulham-road, King's-road, and Unerdale-road, to their railway. The only powers vested in the County Council under the company's Act are in regard to works affecting their sewers. The Highways Committee have therefore seized upon this opportunity to object to the plans submitted by the company on the ground that they do not indicate the extent to which the sewers would be affected by the company's works. The Improvements Committee submitted a report on the subject of tramways subways. Their recommendations were as follows: "(*a*) That, in the event of the Works Committee being prepared to undertake, at the amount of engineer's estimate, the construction of the tramway subway and the subway for pipes and wires, and also the execution of the paving, etc., works between Great Queen-street and Holborn, and between Eagle-street and Vernon-place, such works be carried out by the Council without the intervention of a contractor, and that the working drawings, specification, bills of quantities, and estimate be referred to the Works Committee for that purpose; but that in the event of the Works Committee not being prepared to accept the work at the amount of the engineer's estimate, tenders be invited by advertisement. (*b*) That in the event of tenders being invited by advertisement, the operation of the standing order which requires that all tenders in respect of works estimated to cost £500 shall be opened in the Council by the chairman, be suspended so far as may be necessary to enable the chairmen of the Highways and Improvements Committees to open during the ensuing recess the tenders referred to in the foregoing recommendation, and to accept on behalf of the Council the lowest satisfactory tender, subject to any action taken in the matter being fully reported to the Council at the first meeting after the recess (*c*) That the employment of a resident engineer and of a clerk of works be sanctioned in connection with the above-mentioned works at a total cost not exceeding £550." The Highways Committee presented a report in which they recommended that, under the provisions of the contracts with Messrs. Walter Scott, Limited, for the supply of rails, etc., required in connection with the reconstruction, for electrical traction, of the Tooting, etc., sections of the London County Council tramways, the sum of £455 be retained by the Council, out of the moneys for materials supplied under the contracts, as liquidated damages in respect of the delay of seven weeks, caused by the failure of Messrs. Scott to comply with the terms of their contracts, in the commencement of the roadwork and platelaying; and that the balance, £4,120, of amounts which have been deducted as liquidated damages in respect of other delays in the supply of material under the contracts, be now paid to Messrs. Walter Scott, Limited. Owing to the resignation of Mr. Alfred Baker, consequent on his appointment as tramways manager to the Birmingham Corporation, the County Council have decided to advertise for a successor.

LIGHTING AND GENERAL.

Fife.—The Fife Electric Power Bill has been read a third time in the House of Commons.

Sunderland.—The Corporation have decided to lay electric cables to the east side of the Hudson Dock.

Melksham.—A company proposes applying for a provisional order for supplying electricity in the urban district.

Nuneaton.—The Local Government Board have sanctioned a loan of £1,200 required for electric light purposes.

Bath.—The question of supplying the district with electricity is to be further considered by the District Council.

Accrington.—The Electricity Committee recommend a reduction in the price of electricity for both illumination and power.

Change of Address.—Mr. L. Gaston, consulting electrical engineer, has removed to 32, Victoria-street, Westminster, S.W.

Cannock.—A scheme for supplying electric light and power in the district has been submitted to the District Council by a company.

Newark.—The electric light agreement between the Corporation and the Notts and Derbyshire Power Company has been completed.

Valley.—The Rural Council have agreed to join the Holyhead Urban District Council in the guarantee for the new telephone service.

Ripon.—The Empire Electric Light and Power Company intend to apply for a provisional order for electric lighting purposes in the city.

Holyhead.—The Local Government Board have sanctioned the borrowing of £16,000 towards the electric lighting and refuse destructor scheme.

Gravesend.—The Town Council have obtained sanction to loans of £9,580 and £2,000 for their electric lighting undertaking and refuse destructor.

Dublin.—The Corporation have retained Mr. R. Hammond to advise them on their electric lighting scheme, which is estimated to cost about £300,000.

Trunk Telephones.—The Post Office Department has decided to seek Treasury authority for the provision of a direct Liverpool-Bristol trunk telephone circuit.

Plymouth.—The Electricity Committee report having reduced the charge for the supply of electric current to the Tramways Committee from 2½d. to 2d. per unit.

South Stoneham.—The Inland Waterways, Limited, have given notice of their intention to apply for a provisional order to supply electricity in the district.

Tewkesbury.—The Southern District Electricity Corporation have given notice of their intention to apply for a provisional order to supply electricity within the area.

Swindon.—The new infirmary at the workhouse, which has just been erected at a cost of £15,000, is equipped in the latest style, and is fitted throughout with electric light.

Boston.—The Town Council have decided to light their new municipal buildings by electricity. The installation will be carried out by Messrs. Beavan and Co., of Scarborough.

Dorchester.—The Empire Electric Lighting Company have given the Town Council notice of their intention to apply for an Act of Parliament to light the town by electricity.

Serrated Oilcans.—Messrs. Joseph Kaye and Sons, Limited, of Leeds, inform us that they have received an order from H.M. Navy for 7,500 of their patented serrated oilcans.

Bermondsey.—The Electric Light Committee have engaged Messrs. Kincaid, Waller, and Manville to report upon the possibility of extending the present electric lighting station.

Nelson.—Whitefield School is to be lighted by electricity, and the electrical engineer is to submit to the committee an estimate and specification for the necessary work and fittings.

Calne.—Notice has been received from the Southern District Electricity Supply Corporation of their intention to apply for a provisional order to supply electricity within the urban area.

Hanwell.—The proposal to establish a telephone exchange at Hanwell has been revived, and the Hanwell Urban District Council have promised the company to become subscribers.

Aberdeen.—A recommendation will come before the Town Council to apply for additional borrowing powers in connection with the electric lighting department to the extent of £65,000.

Norwich.—An agreement is being negotiated between the Norwich Mutual Telephone Company and a firm of contractors to equip a telephone exchange suitable for the requirements of the city.

New Australian Cable.—Reuter's Melbourne correspondent telegraphs that the Commonwealth House of Representatives has ratified the agreement with the Eastern Exension Telegraph Company.

Normanton.—The National Telephone Company having secured the necessary number of subscribers for an exchange, their offer to supply the Corporation with an installation has been accepted.

Pontypool.—The area at present lighted by gas is proposed to be lighted by electricity, and the electric lighting company have been asked to state their terms for an extension of the public lighting.

Falkirk.—An agreement which it is calculated will hasten the progress of the Bill in Parliament has been arrived at between the Town Council and the promotors of the Scottish Central electric power scheme.

Bastian Mercury Vapour Lamp.—A private demonstration has been given at the works of the Bastian Meter Company, Kentish Town, of a new mercury vapour lamp invented by Messrs. Bastian and Salisbury.

Westminster Electric Supply Corporation.—The directors have declared an interim dividend for the half-year ending June 30 last at the rate of 13 per cent. per annum, less income tax, payable on Sept. 1, 1903.

South London Electric Supply Co.—The South London Electric Supply Corporation's accounts for the half-year ended June 30 show a net profit of £5,210, against £2,548 for the corresponding six months of last year.

Bury.—It was reported at the Electricity Committee's meeting last week that the receipts for current supplied for motive power during last month showed an increase equal to 100 per cent. on the corresponding period last year.

Holland.—At the last meeting of the County Council the recommendation of the Asylums Committee to expend £3,920 in lighting

Digitized by Google

the asylum by electricity was considered. The question was referred back for further information.

Bookenham.—The following extensions of cables are proposed: Whitmore-road, estimated cost, £30; Westmoreland-road, £70; Hayes-road, £26. An application for an extension of cable in Wickham-road has been deferred.

Hollingbourne.—A conference is being arranged between the Rural District Council and the Kent Electric Power Company with reference to the latter's decision to apply for parliamentary powers to supply electrical energy in the district.

Aberystwyth.—Instructions have been given to the town clerk and the borough surveyor to make enquiries of other boroughs in regard to their existing arrangements for public lighting, the use of gas and electric light, and the cost of each system.

Blairgowrie.—We learn that satisfactory progress is being made with the electric light question. From what we can gather, it is proposed to utilise the water power of the river for generating, and surveys are now being made in this direction.

Metropolitan Electric Co.—The directors of the Metropolitan Electric Supply Company, Limited, have declared an interim dividend for the half-year ended June 30 last at the rate of 8 per cent. per annum, as compared with 7 per cent. last year.

Keighley.—The report on the electricity department states that the electricity sold from July 1, 1902, to June 30, 1903, was 137,721 units, as compared with 90,737 units sold during the corresponding period of 1901-2, being an increase of 46,984 units, or 51·8 per cent.

August Holidays.—We have received notice from the Robertson Incandescent Electric Lamp Company and the Hart Accumulator Company that in both cases their works will be closed during the week commencing Monday, Aug. 3, reopening on Monday, Aug. 10.

Hackney.—The Borough Council have decided to reduce the price charged for electrical energy for power purposes from the flat rate of 2d. per unit to the following: for the first 1,000 units per quarter at any one premises, 2d. per unit; any further consumption at 1½d. per unit.

Chester-le-Street.—Notice has been received by the District Council of an intention to apply to the Board of Trade for a provisional order authorising the supply of electrical energy and power in this and surrounding districts. It was agreed to oppose the application.

Morecambe.—A draft agreement has been approved between Messrs. Ledward and Co. and the Corporation for the supply of condensing plant. The engineer has been instructed to prepare a report as to the best means of dealing with the smoke nuisance at the electric light works.

Penzance.—The Visiting Committee of the Guardians have been asked to bring up a report to the next meeting of the Board as to the desirability of having telephonic communication at the asylum, to be connected with the general telephonic arrangements in the town, together with the cost.

German Telegraph Cables.—Germany possesses 73 cable lines, with a total length of over 10,000 miles. This does not include the second cable now being laid across the Atlantic. One-third of the cables belong to the Government. Of the entire cable system of the world, Great Britain owns nearly two-thirds and Germany one twenty-fourth.

Hoylake and West Kirby.—The District Council propose to make application for sanction to borrow £324 for the erection of a water-softening plant at the electric supply works. The Local Government Board have directed an enquiry to be held respecting the Council's application to borrow £5,435 for electric lighting purposes.

Dunstable.—At the last meeting of the Town Council a communication was read from the Empire Electric Light and Power Company, Limited, intimating their intention of applying for a provisional order to supply electric light and power in the Dunstable area. The Council decided to write to the company and ascertain their precise intentions in the matter.

Shropshire and Worcestershire Power Bill.—The Worcestershire County Council, having withdrawn their opposition to the Shropshire, Worcestershire, and East Denbighshire Electric Power Bill, it has been withdrawn from the consideration of the committee of the House of Commons and referred to Mr. J. W. Lowther, chairman of the Committee of Ways and Means, as an uncontested scheme.

Erith.—With reference to the proposed further loan of £20,000 for electric lighting, the Local Government Board have promised to sanction the borrowing of the money. A transformer station is proposed to be erected at Belvedere. The committee have instructed the electrical engineer to have the connection of the remaining public lamps to the electric lighting mains and the fitting of the lamps for electric lighting forthwith completed.

Electrical Machinery List.—Under the title of "Electrical and Autocar Supplement" of "Philips's Monthly Machinery Register," Mr. Charles D. Phillips has issued a list of new and second-hand electrical machinery, also motorcars and motor bicycles, illustrated throughout. The "Register" is now in its twenty-ninth year of publication, and serves the purpose of a medium for the purchase, sale, or hire of plant of every description.

Underground Telegraphs to the North.—The continuation of the underground telegraph cable is progressing satisfactorily, and the pipes are now being laid in Penrith. It is expected that by the end of the year the pipelaying will be completed as far north as Carlisle. After this is done the cable will be drawn in, and the result expected is that there will be less interruption of telegraphic communication between the Metropolis and the North.

Sunbury.—Edmundsons' Electricity Corporation are about to apply for a provisional order to supply Sunbury with electric light. The proposed charges are 7d. per unit for the first hour and 3d. per unit afterwards, whilst for public street-lighting the company propose to supply at a price not exceeding 2½d. per unit. The company have a large generating station at Twickenham, and wish to take in Sunbury on the way through to Staines and possibly Weybridge.

Eton.—As the result of the recent fire at Eton College, the Urban District Council have decided to obtain a steam fire-engine and the latest electric alarms. A deputation, having visited Liverpool and Blackpool, have presented their report, and, as the consequence, all the houses in each college will be put into electrical communication with the fire station. The governing body of the college are financially supporting the Council in these precautionary efforts.

County of London and Brush Co.—The directors of the County of London and Brush Provincial Electric Lighting Company, Limited, have declared an interim dividend for the half-year ended June 30, 1903, on the ordinary shares, at the rate of 4 per cent. per annum. The amount of electricity sold in the Company's London districts during the half-year is estimated to realise £49,824, which compares with £43,725 for the corresponding period of last year.

Portsmouth Telephones.—The Telephone Committee report that they are constantly receiving new applications for instruments, and before very long an application will probably be made to the Local Government Board for an additional loan. In the meantime the committee are preparing to meet the requirements of the public, and have accepted tenders for a further supply of 250 wall and 50 Edison-Bell table instruments, at a little less cost than those previously supplied.

Hull.—An assistant assistant engineer is to be advertised for at £200 per annum. The committee have adopted a revised scale of meter rents, which, it is explained, will place all consumers of the same size of installation at the same rate, independent of the initial cost of the meter, but which at the present price of meters will recoup the committee to the extent of 10 per cent. per annum on the initial outlay. The present revenue is expected to be reduced by £290 per annum.

North-Western Electricity and Power Gas Bill.—Details of this proposed measure were given in our last issue. On Friday a committee of the House of Commons found the preamble proved, but confined the proposed area of supply to parts of Staffordshire, Denbighshire, Flintshire, and Derbyshire, and excluded the whole of Cheshire. The committee were of opinion that the proposed capital of a million and a half was insufficient for the whole area as proposed by the promoters, and therefore limited the scheme to the districts named.

Stourbridge.—The question of the electric lighting order came before the Council at their last meeting, when the Gas Committee presented a special report requesting the Council to relieve them of the responsibility of carrying out the order, believing that a separate committee would be better able to deal with it. The Gas Committee's report was carried, but not unanimously, and afterwards it was carried by a majority of two that the working of the electric lighting order be placed in the hands of the Railway and Destructor Committee.

Reading.—Trials are being conducted in the Oxford-road with four electric arc lamps erected by the Reading Electric Supply Company, who are in communication with the Corporation with reference to the terms of supply for lighting certain of the tramway routes. Simultaneously experiments are being conducted with incandescent gas burners. The borough engineer (Mr. John Bowen), who is superintending these experiments, will shortly make detailed comparative reports to the Highways and Lighting Committees of the Corporation.

Hythe (Kent).—The Folkestone Electricity Supply Company have offered to become entirely responsible for the whole of the public lighting of Hythe, the hours to be from dusk to midnight, the light of the lamps to be not less than that previously produced by the gas-light, the charge for such lighting to be £560 annually, payable in quarterly instalments. These terms have been accepted by the Council. The Mayor spoke strongly in favour of the proposed scheme, and mentioned that it would effect a saving, as for one year their gas bill totalled £715.

Shildon.—A letter was read from the Northern Counties Electric Supply Company at the last meeting of the Urban District Council stating their experience was that two years was too short a time in which to develop the demand for electricity sufficient to justify the erection of a refuse destructor, and that they thought the Council should be satisfied with the installation of a dust destructor as soon as the electric lighting demand was equivalent to 10,000 8-c.p. lamps. It was decided to write the company asking them to at once make arrangements for the supply of electric light.

Southampton.—Mr. W. Bone, a former mayor, on Monday laid the foundation stone of the new electricity works for the county borough. The original works were purchased by the Corporation from a private company, and the demand for electricity has so increased that it became necessary to provide entirely new works which will be of a very extensive character and are to be completed early in October. As an illustration of the growth of the department it is stated that in 1896-7 the output was 134,843 units, in 1901-2 1,430,222 units, and in 1902-3, 1,732,013 units.

Darwen.—The revenue account of the electricity department for the past year shows a gross profit of £2,924. 16s. 6d., and a net profit, after deducting interest and repayment of principal and sinking fund instalments, of £104. 11s. 9d. No depreciation has been debited to the revenue account beyond the statutory requirements for repayment of principal to the Public Works Loan Commissioners and sinking fund instalments. The amount standing to debit of net revenue account has been reduced by the above profit from £1,630. 0s. 11d. at March 31, 1902, to £1,525. 9s. 2d. at March 31, 1903.

Swansea Telephones.—A meeting of the Telephones Committee of the Corporation was held on Thursday last week, when the manager reported that 98 lines were now fitted with instruments, and can be

Digitized by Google

fitted to switchboards when the contractors hand over the cables. Three hundred and seventy-six subscribers had applied for the limited service, 62 for the message rate, and 18 for the private service, making a total of 456 in all. Orders are coming in satisfactorily, and it is expected that many more would come in when the National Telephone Company's contracts expired and the Corporation telephones had had a fair test.

Ealing.—At the last meeting of the Town Council the Electric Lighting Committee reported that 930 lamps had been applied for since the last meeting. They have resolved to revise the scale of meter rents at present in force. The present charge is 1s. 6d. per quarter up to 25 lights applied for, 3s. up to 50, 4s. 6d. up to 75, and 6s. per quarter for any number over 75. The new scale is: not exceeding 10 8-c.p. lamps, 1s. 3d.; above 10, but not exceeding 25, 1s. 6d.; above 25, but not exceeding 45, 2s.; above 45, but not exceeding 65, 2s. 6d.; above 50, but not exceeding 75, 4s. 6d.; above 65 for any number, 3s.; above 75, 6s.

Maidenhead.—Mr. C. O. Milton, the resident electrical engineer, in his latest report on the electric lighting undertaking, states that the meter readings for the June quarter are very satisfactory. Thirty new connections have been made during the quarter and 9,829 units have been sold to private consumers, this number being less than 3,000 smaller than that for the winter quarter. This of course, is due to the increase in the number of consumers. The revenue amounts to £373 odd, and as the ensuing quarter will earn more than the estimated deficit for the half-year ending September will be on the right side.

Macclesfield.—The recent canvas for probable customers to the proposed electricity undertaking has shown that there are about 120 applications for current, aggregating over 3,000 lamps and over 100 h.p. for motive purposes. Of the applications, two-thirds are from residents within the compulsory area laid down in the Corporation's provisional order, and most of the others from the immediate neighbourhood. The figures far exceed the anticipations of the committee, who have decided to send the results to the three firms who have been asked to tender for the work so that they may form a basis as to the size of the installation.

Floods.—Considerable damage was done to the newspaper presses on the south side of Fleet-street by the heavy rains at the beginning of the week owing to the inadequacy of the existing storm-sewer arrangements. The City of London Electric Lighting Company inform us that they have made special arrangements to place their staff, men, and appliances at the service of any of their customers during such times of emergency. The company have placed a suggestion before the London County Council to provide them with a suitable pumping station, driven by motors supplied with their current, at a trifling cost, which would prevent the recurrence of the recent disaster.

Bristol.—At Wednesday's meeting of the City Council, a debate took place on the question of the inclusion of Bristol in the Somerset and District Electric Power Bill, which, as noted last week, has been passed by the Parliamentary Committees. Mr. Witty declared that this was a blow to municipal trading which should not be minimised by the advocates of that system. Mr. Hughes believed that the city was greatly disappointed, and felt that they had had too much of the sword of justice and not enough of the evenly-balanced scales. Mr. Lloyd held that the result would be that the committee would meet the competition successfully, and eventually the matter dropped.

Halifax Telephones.—An important meeting of the Corporation Finance Committee has been held, at which Mr. Bennett, acting on behalf of a prospective company, presented a scheme for the establishment of a system of telephones in Halifax. In their last parliamentary Bill the Corporation secure powers for municipal telephones, but apparently there is a disinclination on the part of the public to favour for the time being any extension of municipal enterprise. The proposal before the Finance Committee is to the effect that a company should be permitted to operate under the necessary license, and give telephonic accommodation at greatly reduced rates compared with those of the National Telephone Company. The committee intend to consider the proposal made by Mr. Bennett.

Stock Exchange.—The Stock Exchange Committee has appointed Thursday, Aug. 6, a special settling day for Callender (George M.) and Co., Limited, 25,000 preference shares of £1 each, fully paid, Nos. 50,001 to 75,000. Applications have been made to the Stock Exchange Committee to appoint a special settling day in and to grant a quotation to the British Westinghouse Electric and Manufacturing Company, Limited, further issue of 100,000 6 per cent. preference shares of £5 each, fully paid; Metropolitan Electric Supply Company, Limited, 71,083 4½ per cent. cumulative preference shares of £5 each, fully and partly paid; Underground Electric Railways Company of London, Limited, fully and partly paid provisional certificates for £7,000,000 5 per cent. profit-sharing secured notes.

Ipswich.—The electric light and tramway scheme is progressing towards completion, and a reminder of this fact is that the local contractors, Messrs. Reavell and Co., have just completed the official tests on the last of the six engines which they have been constructing. The two largest engines, which are of 400 h.p., have already been completed and delivered at the electric lighting station, these sets being intended principally for providing the electric energy for the tramcars. Two small steam-engines of 80 h.p., with their dynamos, have also been tested and delivered, these engines being intended for the lighting load only. In addition there are two sets of medium size, of 200 h.p., which will be principally used for providing electrical energy for lighting purposes. The tests which were carried out were all successful.

Hammersmith.—At this week's meeting of the Borough Council the Electric Lighting Committee reported that 17 additional consumers had been connected, representing a maximum of 436 8-c.p. lamps, that 14 consumers had been disconnected, and that the total number of consumers now taking current from the mains was 1,271. The committee have approved the plan submitted by the London United Tramways, Limited, showing the positions of the standards to which arc lamps will be affixed in Glenthorne-road, Dalling-road, Paddenswick-road, and Askew-road. The committee have made an arrangement with the Imperial Tobacco Company to supply their factory at Fulham Palace-road with exhaust steam at 3s. 4d. for 100lb. for a period of three years. The company already take electricity from the Corporation department for lighting and power in large quantities.

Gosport.—Plans and estimates are in course of preparation for installing the electric light in the Clarence Victualling Yard, Priddy's Hard, and Forton Barracks. The money necessary to proceed with the work will be included in the naval estimates next year. The scheme is as yet only in the initial stage. It is proposed to erect a generating station in Clarence Yard, with sufficient accommodation for later adding two more boilers and dynamos. Priddy's Hard will be connected by cables carried across the creek under the water. From that establishment the wires will be carried to the Marine battery and then recross the creek to Forton Barracks. The divisional schools and the hospital standing in the field opposite the barracks will be included in the installation. The scheme provides for a large number of arc lights at each of the three establishments in addition to the ordinary connections.

London Electrical Contractors' Association.—At the annual general meeting of the above, held at Frascati's Restaurant on the 27th inst., the president, Mr. Rashleigh Phipps, in the chair, the annual report and balance-sheet was submitted and adopted, and the following officers appointed for the ensuing year: president—Mr. E. L. Berry; vice-presidents—Mr. W. Duncan, Mr. W. W. Strode, Mr. C. L Troup; council—Messrs. Gillard, Joseph, Lund, Marryat, Mossop, Tate, Ratcliff, Tomlinson, Tricket; hon. treasurer—Mr. W. R. Rawlings; hon. secretary—Mr. E. J. Hogan. Among other business, it was decided to hold a series of monthly general meetings for the discussion of subjects of interest to the contracting trade. Any contractors in London and district who have not yet joined the association are requested to communicate with the hon. secretary, E. J. Hogan, 141, Fenchurch street, E.C.

Electrical Manufacturers and Contractors.—At a final conference between the committees of the National Electrical Manufacturers' Association and the National Electrical Contractors' Association recently held, a basis of agreement was finally agreed upon between the two associations. The result of these negotiations has taken some time to arrive at owing to the many difficulties in the way. It is believed, however, that the basis of agreement now come to will prove of a very satisfactory nature to members of both associations. The recommendations of the joint committees were on the same day submitted to the Central Board of the National Electrical Contractors' Association and approved by them. Simultaneously the National Electrical Manufacturers held a general meeting of its members, who also approved of what their committee had done on their behalf. Parties interested on either side can get full information from the secretaries of either association.

Wrexham.—From a statement presented by the borough accountant it appears that the number of units sold during the quarter for private lighting shows an increase of 45 per cent. The charges amounted to £258, an increase of 30 per cent.; the number of consumers was 127, against 87, an increase of 46 per cent.; and the average price obtained per unit was 5·28d., a decrease of 3·5d. For tramways 33,890 units were sold (minimum number charged, 37,000 at 2d.), and the charges amounted to £312. For public lighting the cost was £183, against £178. The total revenue amounted to £755, against £375. The electrical engineer's report, presented at the last meeting of the Town Council, showed that the units generated during June were 29,094, compared with 8,164 last year; 12,755 units were used by the trams and 16,339 for lighting, etc. After a long discussion it was agreed that current for motors be supplied at 2½d. per unit within the regulation area, and that the minimum be reduced from £10 to 30s. It was decided to allow Mr. Sillery, electrical engineer, to conduct an electricity class at the art school.

South Africa.—We learn from *South African Exports* that a scheme of electric lighting for Wellington is being discussed. A number of electric lighting cable extensions have been authorised at Ladysmith, and when these are completed the entire residential quarters of the town will be served. There is considerable interest being manifested by the ratepayers of Potchefstroom in regard to the lighting of the town, offers to do this having been received from Johannesburg firms, but the matter was adjourned *sine die*. The ratepayers, however, have expressed themselves as dissatisfied with this, and several prominent traders have ordered complete plants of their own. The Health Board have, as a result, brought up the matter again, and will consider the advisability of granting a concession for lighting the whole town and military cantonment. The question of public lighting has been agitating the township of Beaconsfield for some time. The De Beers Company have now, at the request of the Beaconsfield Council, resolved to undertake to a certain extent to light the streets of Beaconsfield free with electric light, also to instal electric light in the town hall, and to supply current for municipal purposes only, free of charge. The company will erect 20 arc lamps in the streets, and lay cables sufficient to light private houses along the route, but the current cannot be supplied until the new power station now being erected in the vicinity is completed. The current supplied to the town hall for other than municipal purposes will be charged at 6d. per unit. No responsibility will be accepted by the company for any failure of supply. The Natal Government, being dissatisfied with the Durban municipal telephone service, have installed a system of their own, connecting the eight or ten local departments with the central exchange on the main wharf. The new system covers the whole of the harbour, including cargo sheds, etc. Greater expedition at the port is anticipated.

Leicester.—The Finance Committee report that the Gas and Electric Lighting Committee have submitted to them a proposal to seek power from the Local Government Board to borrow £100,000 to cover the amount already overspent on the electric lighting capital account, and for future extensions of distributing plant. The committee have no comment to make on the proposal. The Electric Lighting Committee report that their engineer, Mr. Alfred Colson, M.I.C.E., has brought under their notice the increase in the demand for current, the capabilities of the present cables and transformers, and the probable demand for current in the near future. The engineer advises that, in order to meet the anticipated requirements of the town as regards the supply of electricity during the next few years, a considerable extension of the distributing plant, etc., will be needed, necessitating an expenditure on machinery of £3,623; for mains and services, £50,550; for transformers, £7,350; for meters (1,500), £7,500; instruments, say, £200—making a total of £69,223.

Mechanical Ventilation Specialities.—Messrs. John Gibbs and Son, of Liverpool, have sent us a copy of their new catalogue of mechanical ventilation specialities, which has been got up in a distinctly attractive style and fully illustrated. The first illustration shows us three of the eight Gibbs fans, each 8ft. diameter, erected by the firm at the Bradford Corporation electricity works, and which are doing very successful work. Glancing through the catalogue, our attention is arrested by an illustration of a 48in. electric fan, dust-proof type, which, we are informed, is approved and adopted as their standard type by leading insurance companies. The fan is made in eight different sizes, the diameter of the blade varying from 15in. to 48in., and the price from £13. 10s. to £57. 10s. The 15in. blade is estimated to remove 1,500 to 1,800 cubic feet of air per minute, the 24in. blade 4,000 to 6,000 cubic feet, the 36in. blade 10,000 to 15,000 cubic feet, and the 48in. blade 25,000 to 40,000 cubic feet. The revolutions per minute range from 1,000 to 1,200 in the case of the 15in. fan to 400 to 550 in the case of the 48in. blade. The machines are stocked wound for 110 and 230 volts continuous current.

St. Marylebone.—The crisis has been reached in the electric lighting trouble at St. Marylebone. The present situation would afford excellent matter for comedy were it not for the serious position in which the Borough Council find themselves placed. Unable to get the consent of the County Council to raise the loan for purchasing the undertaking of the Metropolitan Electric Supply Company, they are now threatened with an application by the "Marylebone Electric Supply Company" to the Board of Trade for powers to authorise this company to supply electricity in the borough. Naturally, the Council will oppose this application tooth and nail, but we think it has a good chance of succeeding with the Board of Trade in view of the present state of affairs. As stated in another column, the Borough Council as a last resource propose to apply for a special license from the Board of Trade which would remove the legal difficulties in the way of the County Council sanctioning the proposed loan, but from what we hear there is a decided disinclination on the part of the Board of Trade to grant these licenses, and it is possible that it will prefer to sanction the application of the St. Marylebone Company to undertake the supply of electricity in the borough.

Camberwell.—As recently noted in these columns, the Camberwell Borough Council have circulated among the London local authorities the documents in connection with the refusal of the Board of Trade to grant to the London Electric Supply Corporation an order under the Electric Lighting Acts in respect of the southern portion of the borough. The matter has come to the notice of the London County Council, who have sent the Borough Council a communication, pointing out that, as regards applications for orders under these Acts, the Council have always been in favour of two companies being allowed to compete in the same area, but they have always considered that any application by a company for an order in respect of an area for which the local authority have been granted an order should be refused. It appears to the County Council that the action of the Board of Trade in the present instance is to some extent a departure from the attitude generally taken up by it in the past. The County Council are in sympathy with the Borough Council in the matter, but it does not appear that the Council have any power to render assistance with regard thereto, as under Section 4 of the Electric Lighting Act, 1882, the Board has a discretionary power to grant a provisional order authorising any local authority, company, or person to supply electricity for public or private purposes within any area, and there is no appeal against the decision of the Board.

Wandsworth.—Dealing with the question of electric light in the borough, it was stated at the last meeting of the Council that the special sub-committee appointed to go into the matter had come to the conclusion that the only remedy for the present evil of high rates was competition. The committee recommended that Mr. Adams, electrical expert, should be empowered, at a cost of £105, to draw up a complete scheme for the supply of electric current generated by power obtained from the Tooting dust destructor, and the recommendation was confirmed. It was reported that the London Electric Supply Corporation had written stating that they would be prepared, if they obtained the provisional order which they sought, to supply consumers in the borough with electric current at 6d. per unit for the first 4,000 units in each year, and 4d. per unit in excess of 4,000, with reductions for large orders. The committee recommended that the company should be informed that the Council could not support their application for the proposed order unless they undertook to supply electricity for lighting purposes at a flat rate of 4½d. per unit to private consumers and 2d. per unit for power. This was agreed to. The General Purposes Committee reported that when the matter of lighting the town hall by electricity was under consideration it was not present to the minds of the committee that the tenders were received by invitation and not by public advertisement. The tender of the City of London, etc., Electric Lighting Company having been accepted by the Coun[illegible] the committee were of opinion that the contract should be proceeded with, and that Mr. A. T. Snell, who prepared the specification, should be retained to superintend the work.

Southwark.—At the last meeting of the Borough Council the General Purposes and Finance Joint Committee reported that the district auditor had disallowed certain charges, thereby leaving the whole deficiency of £3,945. 6s. on the electric light undertaking as a charge upon the rates of the parish of Newington, because no part of the expense incurred under the Act relating to the supply of electricity in the parish of Newington, which extended only to a part of the borough, could lawfully be charged upon the general funds of the whole borough, and because, by Section 10, Sub-Section 4, of the London Government Act, 1899, it was provided that such expenses should be borne by the area to which the adoptive local or other Act in point extended, and because no scheme under the London Government Act had provided otherwise. The committee were of opinion that considerable difficulty would arise hereafter if the undertaking were treated as a parish and not a borough concern, and would materially tend to retard the future unification of the borough. The committee, therefore, recommended that an appeal be made to the Local Government Board against the disallowances of the auditor, and that in the event of the appeal failing, application be then made to the London Government Act Commissioners to issue a scheme under the London Government Act, 1879, making the expenses of the undertaking chargeable to the whole borough. The recommendation was adopted.

Dewsbury.—The annual report of Mr. R. H. Campion, borough electrical engineer, to the Electricity Committee on the working of the undertaking during the past 12 months has been issued, and it is with pleasure we record a successful year in regard to the running of the station and the financial result. The gross receipts by sale of current are £5,469. 18s. 7½d. Discounts have taken £296. 18s. 5d., leaving the net amount £5,173. The total revenue is £5,434. 3s. 10½d. The total costs are £2,778. 9s. 2d. (£107 less than last year), leaving a gross profit of £2,655. 14s. 8½d. This is sufficient to pay the interest and sinking fund charges for the year and leave a surplus of £286, which has gone to help to pay off the deficit of £378 left over from last year. Practically the undertaking is £664 better than last year. Thirty-four consumers have been connected during the year, several of them being millowners, who should run for longer hours than most motor consumers. The capital expenditure during the year has been £3,235, which has taken £92 extra for interest and sinking fund. In his general remarks the engineer states that there is an equivalent of 21,207 lamps of 8 c.p. connected to the mains, an increase of 2,822 over last year. During the year applications were received for supply of 10 additional motors, which now total 38. The number of units sold for the year is 282,340 for lighting, which is an increase of 19,264. Four thousand four hundred and forty units were sold to the tramway company at 4d. per unit for trial runs, and from Feb. 18 to March 31 they used 28,352 at 1½d., so that the total number of units sold is 315,132. The highest load reached for lighting was 263 kw. on Dec. 19 and for traction 200 kw. on March 21.

York.—A quarterly meeting of the City Council was held last week, at which Mr. H. V. Scott, chairman of the Electricity Committee, gave some most interesting details of the working of the electric light undertaking during the past year, supplementing the information given in the annual report, which we published last week. He said there had been a most substantial increase in the business done. There had been a steady increase in the units sold—220,000 in the first year, 423,000 in the second year, and 652,000 in the third year. The cost per unit of providing the light had steadily decreased. In the first year it was 2·428, in the second year 1·960, and in the last year 1·896. The total revenue for the year had been £7,454. 17s., which was a steady increase on former revenues, and the total costs of the concern had been £5,243. Of the latter sum, however, £553 would, if they were a trading concern, be charged to capital and not to revenue, which would leave the profit £2,764, which was exactly 5 per cent. upon the capital expended at the commencement of the year. He thought that was an extremely satisfactory result for a concern only in the third year of its working. With regard to the position of the concern, they were authorised to borrow £90,000, and there was a further sum of £10,850 which they would no doubt receive leave to borrow, making the total borrowed capital of the concern £100,000, or rather over. Replying to criticisms which had been passed upon the concern, he said that the average percentage on the capital of the whole of the public companies of the country set aside for depreciation was 1·1, the average of the municipalities was 2·2, the amount for York was 2 per cent. The average cost of production of all the companies had been 2·35d. per unit, of all the municipalities 2·18d., of York 1·77d. The average price of the public companies to their consumers for lighting was 4·96d., for all the municipalities 4·52d., and for York 3·60d. The average price of public companies for public lighting was 2·64d., of all the municipalities 2·48d., and of York 1·74d., so that in every respect the municipalities beat the companies, and York practically, in every respect, beat the municipalities hollow.

Blackburn.—In his report on the working of the electricity department, Jubilee-street, during the past 12 months, Mr. Alfred S. Giles, the borough electrical engineer, states that the receipts and expenditure, shown in a condensed form, are as follows: receipts, £25,750. 7s. 10d.; working expenditure, £14,208. 3s. 7d.; gross profit, £11,542. 4s. 3d. The interest and sinking fund charges and the above balance is shown as follows: interest, £4,527. 6s. 7d.; sinking fund, £5,180 12s. 6d.—total, £9,707. 19s. 1d. The net profit amounts to £1,834. 5s. 2d. The output from the generating station for the year is 2,503,639 units sold. The works cost has been reduced from 1·09d. last year to 0·79d. per unit. The total costs, including management and distribution to the consumers, has been reduced from 1·48d. to 1·20d. per unit. There is the equivalent of 106,866 lamps of 8 c.p. connected to mains, being an increase of 24,757 over last year. The number of consumers taking the supply of electric energy for lighting and power purposes now number 890, an increase of 107

Digitized by Google

over last year. The total capacity of the works is now 3,720 h.p. The maximum load at any one time was 1,638 kw., on Dec. 17. The average price obtained per unit sold for lighting purposes is 3·83d., a figure which will compare favourably with other towns of the same output. The average for power purposes is 1·59d., and for tramway traction 1·5d. per unit. During the year two more Lancashire boilers have been put down, and the new chimney completed, doing away with black smoke troubles due to working the old chimney beyond its capacity. The buildings in connection with the extension of the works are nearly completed, and one of the new engines has been erected. The contractors are proceeding with the erection of the other plant on order, and this will be all completed during the summer and be in working condition for next winter. Last winter proved a most anxious time for the staff in charge of the generating station, for they were working at times without an adequate proportion of spare plant, but they were able to get through the winter load with but few troubles affecting the general supply for more than a few minutes. The cost of generating has been largely reduced during the year. A large proportion of the economy achieved is due to their being able to use the town's water for condensing purposes, and to being able to contract for a cheaper fuel than that they used last year, owing to having installed additional boilers.

London County Council.—At Tuesday's meeting of the London County Council the Finance Committee brought up a report on the subject of the St. Marylebone electric lighting. The question considered, and upon which the opinion of Mr. Haldane, K.C., had been taken, was whether, if a license be obtained by the Borough Council from the Board of Trade, the Borough Council will obtain such legal power to borrow as will justify the County Council in sanctioning the loan. The committee state that in this event the legal difficulty in the way of granting the loan will be removed, but in the first instance the period authorised by the sanction of the County Council, if given, for the repayment of the money will be limited to the period of the license—*i.e.*, seven years. Such period, however, will be open to consideration after purchase. Upon the recommendation of the Finance Committee, it was agreed to lend the Poplar Borough Council £3,345 for electric lighting, and the Hampstead Borough Council £1,273 for street-lighting. The Bridges Committee reported on the resolution of the Council to accept the offer of the London Electric Supply Corporation to supply electric current for lighting and working the lifts at Greenwich Tunnel at the rates of 2d. and 1½d. per unit respectively. An expenditure of £1,900 for electric plant to enable the supply to be taken has already been sanctioned. The committee have been in communication with the corporation as to the amount to be paid to it for plant under the proposed agreement, and have arranged that this shall not exceed £1,650, made up as follows: two motor-generators and switchboards complete, erected and set to work, £1,470; high-tension feeder through tunnel, £125; contingencies, £55. Other work, such as the foundations and covering for the generators, will be undertaken by the Council. In connection with the price to be paid for current for lighting purposes, the committee have considered an offer of the corporation to reduce the charge from 2d. to 1·8d. on condition that the Council will not work the lifts on Sundays. This offer, if accepted, will effect a considerable economy on lighting, and in addition the cost of power for working the lift on Sundays will be saved. There will be no business use for the lifts on those days, and the 24 hours' break would be very useful for the purpose of overhauling the machinery should this be necessary. Under the circumstances the committee have decided to accept the offer. Notices were received from the following companies of intention to lay electric mains subject to certain conditions: Charing Cross and Strand Electricity Supply Corporation, City of London Electric Lighting Company, County of London and Brush Provincial Electric Lighting Company, and Notting Hill Electric Lighting Company.

Croydon.—Mr. J. Gray Scott, borough electrical engineer of Croydon, has presented to his committee a report on the past year's working of the electricity undertaking. He states that the returns for the period under review are gratifying, showing, as they do, an all-round improvement on the previous year, and representing the most successful year of working in the history of the undertaking. The capital expenditure has increased from £212,389 to £231,353, the expenditure during the year amounting to £18,964. The total receipts for the year amount to £40,154, as compared with £27,483 for the previous year; the total expenditure amounts to £21,875, as compared with £14,582 in the previous year, leaving a balance of gross profit to be carried to the net revenue account of £18,200 as against £12,850 last year. The net profit for the year, after payment of interest and sinking fund, amounts to £4,654. 17s. 8d. The return on the average capital outlay therefore represents 8·54 per cent. The capacity of the plant in kilowatts amounts to 3,215, and the maximum load reached was 2,127 kw. This represents an increase in load on the station of 444 kw. The number of consumers during the year has increased from 1,043 to 1,378, an actual increase of 335, or 32 per cent. The number of 8-c.p. lamps connected at March 25, 1903, was 96,479, as compared with 78,386 for the corresponding period of last year, representing an increase in lamps connected of 18,093. The average price obtained for private supply was 4·34d. per unit, as compared with 4·39d. per unit for the previous year. With regard to the analysis of costs: the cost of generation and distribution, which includes coal, oil, and other stores, wages, repairs, and maintenance, amounts to 1·26d. per unit sold, as compared with 1·34d. per unit for the previous year. Adding to these figures the items of rents, rates, taxes, etc., and management, the total cost per unit sold during the past year amounts to 1·58d., as compared with 1·82d. for the previous year. Dealing with the output of the works, it will be seen from the statement of electricity generated, sold, etc., that the number of units generated during the past year amounts to 3,889,794, as compared with 2,310,876 for the previous year. This represents an increase of 68 per cent. After deducting the units used for station lighting, testing, and driving auxiliary plant, also allowing for the losses in distribution, the actual number of units sold for private lighting, public lighting, and tramways amounted to 3,131,841, as against 1,810,387, an increase of 73 per cent. The percentage of units sold to units generated is 80, as compared with 76 the previous year, and it will be his endeavour to still further increase this efficiency of distribution by reducing the proportion of losses incurred. The engineer goes on to refer to the fact that during the past year they have been severely handicapped in the work of the department by several circumstances beyond their control. The supply was entirely disorganised by the fire which occurred at the end of October, and since that date until very recently the works have been run with temporary mains on the engine-room floor, and other similar arrangements of a temporary nature. It has been necessary to gradually carry out the work of permanent reinstatement, but at the same time always maintain an efficient supply. Their position with regard to stand-by plant has been an undesirable one, and he points out how very serious a responsibility rests upon his assistants and himself when they are confronted with the fact that for a certain period of the year, at any rate, the supply throughout the borough for tramways or lighting is entirely dependent upon certain portions of plant, a breakdown of which would involve serious inconvenience and loss, not only to his department, but to the borough generally. There is a further disadvantage in running a station to its full capacity, and that is, that in the event of machinery or plant of any kind to be supplied under contract proving unsatisfactory, it is impossible to reject the plant in the event of serious defects, while in the event of minor defects arising, which might easily be located by the contractor, were he provided with ample opportunity for doing so, it is sometimes difficult to make the necessary provision under the above circumstances. The subject of further extensions of plant in the station will be dealt with in a separate report, but he impressed upon the committee the desirability of anticipating a continually increasing demand for a supply of electricity, having in view the progress of the station since the commencement of the undertaking, and the rapid strides in its development which are at present being made. The report then goes into detail, giving particulars of the plant installed, mains, sub-stations, etc. In conclusion, Mr. Scott expresses his appreciation of the loyalty and hearty co-operation of his assistants and the members of the staff.

PROVISIONAL PATENTS, 1903.

JULY 20.

15968. Improvements in electric batteries. Alfred Blackman and Charles Ernest Warren, 115, Cannon-street, London.

15970. Improvements in and connected with electric tramcars. James Albert Lycett and George John Conaty, 128, Colmore-row, Birmingham.

15972. Improvements in switches and rheostats for starting and controlling electric motors. Frederic Osmund Hunt, 21, Mount-vale, York.

15975. An improved suspender for carrying balance weights used as electric lighting accessories. Richard Thomas Grocott, Whitehall Works, Longport, Stoke-on-Trent.

15979. An improved switch lampholder for electric lighting. George Casperson, 11, Upper Mill-hill, Boar-lane, Leeds.

15980. Indicating attachment on electric fuseways. James Wilson, 90, Boston-street, Hulme, Manchester.

15992. Electromagnetic brake for electrically-propelled cars of tramways and street railways. Heinrich Seggel, 78, Fleet-street, London. (Complete specification.)

15995. Improvements in charge indicators for secondary batteries. Hiram Percy Maxim, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents Act, 1901, Aug. 4, 1902, being date of application in United States.) (Complete specification.)

16014. Improvements in casings for electric conductors. Warner Valentine Smith, 18, Southampton-buildings, Chancery-lane, London.

16033. Improvements in apparatus for regulating the supply of current in electric mains. Herbert William Butler, 47, Lincoln's-inn-fields, London.

JULY 21.

16078. Improvements in and relating to electricity motor meters. William Hamilton, 18, Southampton-buildings, Chancery-lane, London.

16100. Improvements in circuit-controlling devices chiefly designed for use with electric flash signs. Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London. (Automatic Time Switch Company, United States.) (Complete specification.)

16113. Improved means and apparatus for producing and detecting Hertzian oscillations. John Nevil Maskelyne, jun., 6, Bream's-buildings, Chancery-lane, London.

16114. Improvements in interrupters for use with induction coils and other electrical apparatus. John Nevil Maskelyne, jun., 6, Bream's-buildings, Chancery-lane, London.

16132. Improvements in and relating to rectifying polyphase alternating currents by means of unipolar cells. William Edward Evans, 27, Chancery-lane, London. (Allgemeine Elektricitäts-Gesellschaft, Germany.) (Complete specification.)

Digitized by Google

16115. Improvements in electric system of fire-alarm and signalling apparatus. Frank Hubber and William George Higgs, 6, Bream's-buildings, Chancery-lane, London.

16133. Improvements in electrical signalling systems for railways. Charles Willard Mills and William Walter Piddington, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

JULY 22.

16142. Improved switch hook for telephones. Robert Frederick Hall and Thomas Linforth Jones, Cheston-road, Aston, Birmingham.

16148. An improved fuseboard for any number of ways. Albert Reame, 48, George-street, Hull.

16159. Improvements in or connected with electric measuring. Arthur Thomas Cooper, 15, Water-street, Liverpool.

16190. Improvements relating to tension-limiting devices for electrical apparatus. Henry Harris Lake, 45, Southampton-buildings, Chancery-lane, London. (Compagnie de l'Industrie Electrique et Mecanique, Switzerland.) (Complete specification.)

16191. Improvements relating to the deposition of metals or metallic compounds. Sherard Cowper-Coles and Co., Limited, and Sherard Cowper-Coles, 45, Southampton-buildings, Chancery-lane, London.

16208. Improvements in and relating to nozzles for elastic fluid turbines. The British Thomson-Houston Company, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

16209. Improvements in apparatus for governing elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

16210. Improvements in and relating to elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

16211. Improvements in elastic fluid turbines. The British-Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

16212. Improvements in elastic fluid turbines. The British Thomson-Houston Company, Limited) 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

16213. Improvements in elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

16214. Improvements in elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

16215. Improvement in elastic fluid turbines. The British Thomson-Houston Company, Limited, 83, Cannon-street, London. (Charles Gordon Curtis, United States.)

COMPLETE SPECIFICATIONS ACCEPTED.

To be published August 13, 1903.

1902.

15842. Electric switches applicable for electrically-driven hoists or other machines. Etchells.

16241. Prevention of formation of deleterious vapours by electric discharges in air. Viertel und Gebrüder Siemens und Co.

16706. Galvanic cells. Strickland.

16711. Electrical conductors. Siemens Bros. and Co., Limited, and Dieselhorst.

16776. Electrically-operated safety clutch for hoists. Horsfall and Crowther.

16839. Polyphase induction motors. Siemens Bros. and Co., Limited, and Lydall.

18317. Electric arc lamps. British Thomson-Houston Company, Limited. (Wood.)

18327. Starting devices for electric motors. British Thomson-Houston Company, Limited. (Read.)

19089. Carbon-feeding mechanism of electric arc lamps. Veritys, Limited, and Ridings.

19442. Electrical switches. Macfarlane.

20445. Terminals for electric wires. Wolseley Tool and Motor-car Company, Limited, and Austin.

20482. Electric safety fuses. Peard and Dew.

20643. Safety appliances for controlling the action of winding engines. Siemens Bros. and Co., Limited. (Siemens und Halske Aktiengesellschaft.)

20646. Safety appliances for winding engines. Siemens Bros. and Co., Limited. (Siemens und Halske Aktiengesellschaft.)

20663. Means or apparatus for attaching electric sconces and the like to walls, ceilings, and other places. Van Hooydonk.

22017. Construction of underground conduits more especially intended for use in systems of underground electric traction. Devonshire.

22184. Electrical signalling and controlling apparatus, chiefly designed for artillery purposes. Lewis and Kirke. (Secret document under Sec. 44, Patents, etc., Act, 1883.)

23323. Sparking plugs for use in connection with the electric ignition systems of internal-combustion engines. Foley.

1903.

1606. Trolley arms used on electric tramcars and like vehicles. Wilkinson.

2239. Electric wiring for lighting and other installations. Bayliss and Browne.

4410. Method of producing storage battery plates. Fairweather. (General Storage Battery Company.)

8524. Electric signalling apparatus for railways. Oesterreicher and Nemelka.

8600. Telephone transmitters. Fahnestock.

11426. Vibrators for sound telegraph apparatus. Lind.

12203. Electric burglar alarms. Schubert.

12865. Electric burglar alarms for vaults, safes, and the like. Miller.

12982. Conduits, conductors, and contact devices or collectors for electric railway and tramway systems. Kuchinka.

13109. Feed wheels for automatic telegraph perforators and transmitters and for chronographs and like instruments. Gell.

13281. Device to be used in connection with telephone receivers. Capell.

13305. Brush boxes of dynamos and motors. W. H. Allen, Son, and Co., Limited, and Hawkins.

13570. Electromagnets for magnetic ore extractors. Haddan. (Bergmann-Electricitatswerke Aktiengesellschaft.)

14021. Galvanic batteries. Brandt.

NOTES.

Edison's Storage Battery.—If we are to believe a report which comes from New York, Mr. Edison's storage battery for motorcars has now reached the practical stage, and will be put on the market before the end of the year. A 5,000-mile running test concluded recently is claimed to have proved the excellent durability of the battery, but with regard to the length of run on one charge, the correspondent is ominously silent.

Sir Wm. Preece.—It is with sincere regret that we hear of the serious illness of Sir Wm. Preece, K.C.B. The eminent electrician has been confined to bed for over a week suffering from pneumonia and pericarditis, and his condition is stated to be grave. Latest bulletins fail to show any permanent improvement in the patient's condition, but we are sure our readers will join with us in wishing Sir William a speedy recovery and return to his professional duties.

Enclosed Electric Fuses.—Mr. Jos. Sachs has been awarded the John Scott legacy premium and medal of the Franklin Institute for an invention relating to electric fuses. The principle and details of the invention are covered by patents. It appears that the improvement Mr. Sachs has made consists in the introduction of a solvent flux in the interior of the chamber and surrounding the fuse. The function of this flux is to dissolve and remove from the surface of the fuse the coating of oxide which is formed, and which tends to retain the metal of the fuse wire in the circuit after it is melted, thus preventing an immediate rupture of the circuit.

Electrical Combine in India.—Combinations of electrical engineering concerns are not confined to these shores, nor to America or Germany. We hear of one in India which is making good progress under the title of Marshall-Crompton. Indeed, the combine is already at work with a view to securing concessions for electric lighting in different States. Chief among the concessions sought is one from the Bombay Government to supply electrical energy within the municipal area of Karachi and the North-Western Railway. Another application has been made to the Central Provinces Government with respect to Nagpur, and similar enterprise is being shown in other districts.

Ether Waves and Interference.—We are interested to learn from a New York correspondent that Mr. Nikola Tesla has succeeded in immunising his system of wireless telegraphy from external interference by adopting the principle of tuning. Many another inventor of wireless telegraph systems have made similar claims, not excepting Mr. Marconi, but it is a point that requires more than mere assertion to be properly accredited. Some success has undoubtedly been achieved in this direction, but the possibility of external interference still remains one of the chief obstacles in the way of a successful wireless telegraph service for commercial purposes. Another New York correspondent says that Prof. Stone, of the Massachusetts Institute of Technology, claims to have discovered a selective system of wireless telegraphy which enables the tall masts to be dispensed with. Details are wanting.

Wireless Fire-Alarms.—Electric fire-alarms have been exploited by many inventors, and in certain towns they are a wonderful help to the fire brigade in preventing damage by giving timely warning. We refer particularly to automatic alarms in which the rise of temperature in a building calls the brigade directly. The most recent development of such an alarm is one patented by Mr. Guarini for doing without communicating wires. Experiments in Brussels have shown that the system will work, but we are not hopeful of any system which depends on the Hertzian wave for giving such an alarm. Quite apart from the difficulty of getting good distinctive signals from a large number of subscribers, there is the interference question, which is even more serious in a fire-alarm system than in ordinary telegraphy. Up to the present we know of no experiments which give that secrecy and freedom from interference with wireless telegraphy which can be obtained easily and cheaply when wires are employed.

The Telautograph.—Dr. Karl Gruhn, of Dresden, is probably the latest inventor to adopt a form of the telautograph, which is an instrument for reproducing handwriting or simple line drawings telegraphically at a distance. Instead of using a stylus at the receiving end, Dr. Gruhn employs a moving beam of light, which writes the message transmitted on a strip of sensitised photographic paper. The principle is not unlike that of the Pollak-Virag method of telegraphic writing, which was explained in these columns a few weeks back. The electrical resistance is varied by the sending pen through sliding contacts. These influence two electromagnets in the receiving station. By these electromagnets a small mirror is made to move a beam of light, and this moving beam of light acts as the recording pencil. The beam of light falls on a strip of bromide paper unwound from a roll. After being acted on, the moving strip passes through a developing bath and a pair of drying rollers, and emerges as a photograph of the writing dispatched.

"Science Abstracts."—The Council of the Institution of Electrical Engineers has now, with the approval of the Physical Society, undertaken the publication of *Science Abstracts* as an Institution publication. In connection with this work Mr. Louis H. Walter, M.A., A.M.I E.E., has been appointed editorial assistant to the secretary, and will take up his duties in the autumn. It is not difficult to read between the lines of the above announcement which we have received from the secretary of the Institution. The conclusion is that all the time the members and associates received these abstracts without extra charge they were pleased with the same, but that a sufficient number would not undertake to pay the small extra sum required for them when they were an independent publication. We think the Institution has done quite the right thing to take the matter up, and we trust that they will revert to the old plan of sending these abstracts to every member and associate. If this be done, the members are encouraged to have on their shelves these useful abstracts, and in this way they will learn the value of the production.

Junior Institution of Engineers.—The summer meeting of this institution, of which Colonel E. Raban, C.B., director of works of the navy, is president, is to be held at Sheffield. The proceedings will be opened by the Lord Mayor (the Right Hon. J. Wycliffe Wilson, J.P.) on the 17th inst., who will receive the members at the town hall. Messrs. Davy Bros.' works will then be visited, and afterwards those of Messrs. Hadfield's Steelfoundry Company at Tinsley. On Tuesday there will be an excursion to Haddon Hall and Chatsworth. Messrs. Charles Cammell and Co.'s works will be visited on Wednesday morning, and in the afternoon those of Messrs. J. Dixon and Sons. Thursday will be occupied by an excursion to Castleton, and on Friday are to be seen the Toledo Steelworks of Messrs. J. H. Andrew and Co. and the Suffolk Works of Messrs. T. Turner and Sons. The summer dinner takes place in the evening at the Royal Victoria Hotel, Sheffield. Mr. Ernest King, of Messrs. Mellowes and Co., Corporation-street, Sheffield, is acting as hon. local secretary. The.

Digitized by Google

programme includes various hospitable invitations arranged for the entertainment of the members during the week.

The Motorcar Bill.—During a discussion on the Motorcar Bill in the House of Commons on Tuesday, Mr. Walter Long, on behalf of the Government, was led to make promises to amend what are practically the two most important provisions of the Bill. In the first place, he agreed that some test of efficiency should be imposed before a driver of a motorcar was licensed; and, what is more important still, he promised, secondly, to consider the imposition of a speed limit in rural districts. For towns and congested districts this has already been fixed at 10 miles an hour, and in the House of Lords the Government stedfastly refused to apply any limitation to the speed of motors in the country, preferring to place the responsibility on the motorist not to drive to the public danger. Mr. Long has now promised to reconsider the matter, but it is not expected that the Government will propose to fix the limit at anything under 30 or 35 miles an hour. This, it is anticipated, would meet with favour among motorists generally, whereas the proposal of a lower speed limit would probably arouse so much opposition as to endanger the safe passage of the Bill through Parliament.

Cable Rates to Australia.—Sir Edward Sassoon having asked in what proportions the rate of 3s. per word charged for a telegram from London to Sydney, *viâ* the Pacific Cable, is divided up, Mr. Austen Chamberlain states that the sum is divided as follows: Atlantic Cable Company, 8d.; land lines in North America, 4d.; Pacific Cable Board, 1s. 7d.; Australian Government, 5d. Out of the sum of 8d. accruing to the Atlantic cable companies the Post Office is paid the ordinary inland rate in respect of such telegrams as are dealt with at postal telegraph offices. In respect of telegrams dealt with entirely by the companies, no payment is made to the Post Office beyond the rent which the companies pay for the use of their special wires. Under normal circumstances the transit of the Pacific Cable telegrams is effected only over Canadian territory. The Atlantic cable companies at present charge 1s. for the transmission in the service instructions of the date of a telegram and time of handing in—that is, one-fifteenth of the cost of a five-word telegram. All unrouted telegrams from this country to Australia handed in at postal telegraph offices are divided between the Anglo-American and Direct United States Cable Companies and the Commercial Cable Company.

King's College Engineering Course—In a letter to the *Times* of a recent date, Dr. Arthur C. Headlam, principal of King's College, writes on the subject of the scheme the college proposes to adopt as an experiment for alternating the college course for engineers with training in the workshops. The proposal is making considerable advancement. Arrangements have been made with firms for receiving candidates, and the matter has been brought before the Technical Education Board of the London County Council, who have shown the greatest sympathy towards the experiment, and have voted a sum of £500 for extension of laboratories and equipment, on condition that it is met by a sum of at least an equal amount for the necessary increase in maintenance expenses. The full amount required for making the experiment is £1,000 for laboratory outfit and £1,000 a year for increased annual expenditure, although the new system of training will be started at once. There is a strong evidence of opinion that in the present stage of engineering education in the country the practical value of this method of training should be thoroughly tested, and Dr. Headlam appeals for assistance to all those who feel how important it is that our technical training should be as good as possible.

Electrolysis of Alkali Sulphides.—A paper under this title by Messrs. A. Brochet and Georges Ranson is abstracted in the current number of the *Journal* of the Chemical Society. In the course of their experiments these gentlemen found that Durkee's statement, that solutions of alkali sulphides when electrolysed yield first thiosulphates and eventually sulphates, is confirmed for dilute solutions. When concentrated solutions are employed at temperatures of from 50deg. to 70deg., sulphur is produced at the anode and dissolves in the electrolyte, forming polysulphides, whilst at the cathode sodium is formed, and hydrogen or hydrogen sulphide evolved. The use of a diaphragm does not alter the course of the reaction, but in this case hydrogen sulphide alone is evolved. With dilute solutions of alkali sulphides the anode must be constructed of platinum; when concentrated solutions containing sodium chloride are used the anode may be of platinum, lead, or carbon, whilst in the absence of sodium chloride iron or nickel may also be employed. Copper in all circumstances behaves as a soluble electrode. During the experiments the needles of the voltmeter and ampere-meter oscillated regularly and in opposite senses, due to the continuous deposition of sulphur and its immediate solution from the anode.

Engineering Colleges in India.—Our contemporary, the *Indian and Eastern Engineer*, has in its last two or three issues been giving illustrated descriptions of the engineering colleges of India, and the Thomason Civil Engineering College at Roorkee has come in for special attention. The equipment of this college in its several sections is apparently as efficient and up-to-date as could be desired. There are mechanical, electrical, physical, and chemical laboratories, in which tests are carried out in connection with engineering and other industries. In these investigations the testing of all types of electrical measuring instruments takes a large part, and also of lightning conductors, while researches into Rontgen-ray emanations are at present being made with much success. The workshops are thoroughly modern in design and equipment. They include a carpenters' shop, foundry, smithy, machinery and fitting shop, engine-room, boiler-room, electrical test and switch room, and a mechanical shop. The power for working the machinery is distributed by electricity. This was one of the first workshops in India to be run by this method, and it has been found to work extremely conveniently and satisfactorily. Electrical driving is employed in the foundry in connection with a crane, and also for other purposes. In other sections the equipment appears to be equally satisfactory, and is fully kept up to modern requirements.

Municipal Accounts.—The Joint Parliamentary Committee on Municipal Trading have issued their first report, having commenced their enquiry on June 15. The committee's deliberations so far have been confined to an enquiry into the question of municipal accounts, and the evidence taken has been directed particularly to the form in which these accounts are prepared, the systems under which they are audited, and the right of access to them possessed by the ratepayers. The committee make a number of important recommendations, with which we hope to deal more fully in a future issue. Briefly, however, it is recommended, in the first place, that a conference shall take place between the various institutions in the country representing the interests of accountants and auditors, to consider the question of prescribing a standard form of keeping accounts; and secondly, it is proposed to abolish the existing systems of audit applicable to corporations, county councils, and urban district councils in England and Wales, and that the auditors shall be appointed by

Digitized by Google

these three classes of local authorities themselves. An auditor so appointed would hold office for five years, his appointment being subject to the approval of the Local Government Board. In the case of Scotland the present system of statutory audit of accounts will probably hold good, with the exception of the five large cities, which will be treated in a like manner to that proposed for England and Wales.

Trunk Telephone Communication.—The Postmaster-General has sent an important communication to Mr. M'Arthur, M.P., in reply to the latter's representations regarding frequent and serious delays in the trunk telephone communication between Liverpool and Manchester and other commercial centres in Lancashire and Yorkshire. Mr. Chamberlain states that these services will be greatly improved in the near future by the opening of additional circuits between Liverpool and Wigan, Accrington, Bolton, Burnley, Bury, Oldham, Rochdale, St. Helens, and Huddersfield. The completion of the whole of these circuits depends on that of a new underground line between Liverpool and St. Helens, which it is expected will be finished early next month. Besides the above circuits, five additional circuits are being provided between Liverpool and Manchester. These will be carried by means of a new underground line through Warrington, which is being pushed forward as rapidly as possible, but some little time must elapse before the circuits can be brought into use. Most of the additional circuits were authorised a considerable time since, and the delay in completing them is due solely to the necessity for the new underground routes and the existing lines being practically filled with wires. Mr. Chamberlain further promises an enquiry into the alleged interference of the traffic between Liverpool and Manchester by somewhat numerous interruptions of the wires, and holding out a hope that it will be possible to improve the working.

Central Technical College.—The diploma of associate of the City and Guilds Institute has been awarded to the following matriculated third-year students of the Central Technical College who have completed a full course of instruction as prescribed by the council: civil and mechanical engineering—J. D. Griffin, R. C. Munro (Siemens Medal), H. H. Baxter, H. F. Bayley, W. E. G. Bender, G. W. M. Borns, C. E. Capito, J. R. Fox, E. A. Gatehouse, C. J. Guttmann, V. B. Harley-Mason, W. H. Hingston, E. W. Lace, E. Latham, E. De Lautour, R. E. Lehuraux, F. E. Maynard, J. E M. McGregor, H. W. Nicholson, T. C. Ormiston-Chant, D. A. S. Porteus, L. F. Rampal, M. K. Rice-Oxley, F. J. Salberg, E. A. Salt, C. F. Satow, A. E. Scoones, J. H. Segrave, C. G. Smith, V. C. Smith, C. E. Thomson, T. W. Wallace; electrical engineering—A. A. Gomme (Siemens Medal and Premium), J. M. De Artola, W. A. Burton, W. G. H. Cam, F. Creedy, R. S. Dahl, A. G. Ellis, E. P. Elwin, S. F. W. Finnis, A. L. Glegg, C. E. Greenslade, G. R. Griffin, P. H. Harding, M. S. Kennedy, A. H. Knight, T. F. Lee, L. Lehuraux, H. M. Lyons, F. Neuhaus, C. Petersen, H. S. Plymen, R. H. Turrall, L. D. Wainwright; chemistry—E. F. Armstrong, R. J. Caldwell, J. V. J. Hayman, C. D. McCourt, F. J. Salmon. In addition to the above, certificates have been awarded to 26 matriculated third-year students who have completed a full course of instruction at the Central Technical College, and to 55 students who have completed a full course of instruction at the Technical College, Finsbury.

Guernsey Telephones.—We have received a statement of accounts of the States of Guernsey telephone system for the year 1902, and, as usual, they contain some noteworthy points as to the success of an undertaking of this description. To begin with, there were 1,073 lines working on Dec. 31 last, exclusive of junction lines. The population of the island is 40,300, which is thus equal to one telephone to every 37·5 souls, and it is justly claimed that Guernsey is the best telephoned area in the United Kingdom. The total capital expenditure on telephone construction stands at £18,849, and in addition to this £2,241 has been expended on the purchase of land and erection of buildings, as the interest on money so invested is considerably less than the annual rent cost of similar buildings taken on lease. The cost per line comes out at the low figure of £17 odd. Last year the total revenue amounted to £3,483, or £3. 4s. 11d. per line per year. A little over £2,717 has been set aside out of this sum for capital sinking fund and depreciation, after paying interest, Post Office royalty, and all working expenses, and another sum of £195 has been placed to the special contingency fund out of revenue. Notwithstanding these heavy charges, a net profit has been realised of £157, a result which Mr. A. R. Bennett, the consulting engineer, and the permanent staff can afford to congratulate themselves on. Good headway is being made with the extension of the system. At the end of last year, in addition to the 1,073 working lines, there were several hundred spare partially-completed lines. If the value of these were deducted from the cost of construction, the cost of the working lines would be even less than is stated above.

Electric Cables for High-Voltage Service.—In a paper under this title read before the recent Niagara meeting of the American Institute of Electrical Engineers, Mr. Henry W. Fisher gave some interesting notes on the manufacture of cables. Since paper-insulated cables have been improved some engineers prefer paper to rubber, the life of paper cables being assumed to be longer than that of rubber cables. On the other hand, the ability of a rubber-insulated cable to withstand high voltages depends upon the ingredients entering into the composition of the rubber compound. The dielectric strength to resist electric pressure becomes greater within certain limits with increased percentages of pure Para or other high-grade rubber, and there is good reason for believing that when lead-covered cables are employed, the life of rubber-insulated cables is lengthened with increased percentages of such rubber. In the manufacture of paper-insulated cables for high voltages great care has to be exercised in selecting the right kind and quality of material, and also in the methods of construction and impregnation of the paper with the insulating compound. Cables saturated with oily compound can better be handled without injury to the dielectric, and also resist better high voltages. The use of oily compound is, however, accompanied with lower insulation resistance, and consequently many engineers who think they are adopting the best practice by specifying several hundred megohms per mile are in reality inviting bids on an undesirable type of cable. The carrying capacity of cables as frequently recommended is entirely too great when many cables are in the same duct system. In this case the middle and top one, although carrying normal currents, are apt to become very warm. Under no circumstances should the temperature of the conductor be allowed to reach 90deg. C.

Electric Shock.—In a paper read before the Verein Deutscher Revisionsingenieure, Dr. Kath treated of the conditions for the safety of the men driving electrical plant. Direct current, he pointed out, will, as a rule, become really dangerous only in the case of several unlucky circumstances being present at the same time, as its tension seldom exceeds 500 volts. Direct-current machines should be enclosed tightly, so that sparking, liable to endanger

Digitized by Google

the surrounding medium, is prevented. As regards the properties of the human body, the author draws attention to the fact that an electric shock will essentially act on the nervous system, as the nervous substance is a conductor of electricity surrounded by less conductive fat and muscle substance. The paths most frequently followed by the current in the case of accidents will afford an evidence as to which nerve strings are most likely to be struck, which functions most liable to be paralysed, as being controlled by these nerves. In the case of the shock entering by a hand or the head and leaving by the other hand or a foot, the nerve descending from the neck and leading to the lungs and heart—the so-called *nervus vagus*—will be struck, and as the latter regulates both the respiration and the action of the heart, respiration will first be stopped, and the action of the heart will eventually cease in the graver cases. A shock entering by the points of the fingers and leaving by the upper arm, however, will, as a rule, not be attended by fatal results, the above nerve not lying on its way. The best assistance in the case of an accident will be rendered in the way of producing artificial respiration, enforcing the heart action and diminishing the pressure of blood, the latter being obtained by injecting one to three drops of amyl nitrate. The dangers of electric currents will, moreover, vary to a high degree according to personal predisposition, persons subject to alcoholism, as well as those easily frightened, suffering much more from the effect of electric shock than normal people. The limit of danger is considered as coinciding with 0·1 ampere.

Pacific Cable Finances.—It was not to be expected that the "all-red" Pacific Cable would return a profit or even meet expenses during the first few years of operation, so the fact that there is likely to be a loss of over £200,000 in two years does not come as a surprise to anyone. The expenditure in the year 1902-3, when the line was in course of construction, was £120,000, and under agreement this will be met by proportional contributions from the Colonies. In the estimates for the present financial year there is an item of £77,540 for interest, including instalment repayment of principal, which, of course, is included in the total annual expenditure. The revenue is estimated to amount to £73,400, and the total expenditure to £165,500, showing an estimated deficit of £92,100. But when the large amount of £77,000 odd for interest, etc., is put on one side, and the working expenses only balanced against the revenue, it is seen that the loss on the first year of operation is quite within a reasonable limit—a matter of some £15,000. It is interesting to consider some of the principal items of expenditure in an undertaking such as the Pacific Cable. In the first year the expenditure of £120,000 was made up of interest on capital, salaries, station expenses, repairing ship, and renewals for cable, but in that year the line was not in operation. In the current year, besides the interest payments, the principal items of expenditure are estimated as follows: Board salaries and expenses, £4,400; cable stations, salaries, and expenses, £26,300; repairing ship, £19,500; renewals and depreciation, £35,500; and miscellaneous, £2,250—a total of £165,500. The total estimated loss on March 31, 1904, is estimated at £212,100, and as Australia has to provide one-third of this deficit, about £70,000 will have to be provided by the Commonwealth Parliament within the next eight or nine months. It will be noticed that these large deficits are more apparent than real, as in the case of a company no interest or repayment of capital is made during the early years of working.

Street-Lighting at Westminster.—Mr. J. W. Bradley, city engineer of Westminster, is rendering electricity an important service by issuing quarterly reports of the comparative merits from an economical point of view of gas and electric lamps for street-lighting. Once again, and in his latest report, Mr. Bradley gives authoritative figures to show that the electric arc lighting of Westminster costs the ratepayers a comparatively insignificant figure as against the gas lamps. Supply is taken from three electric light companies for the arcs in different parts of the city, and, with one exception, the total cost per candle-power per hour comes out at half, a third, and in one case a fourth of the gas lamps. Witness the following figures representing the total cost per candle-power per hour in every case: For the electric arcs supplied by the Charing Cross and Strand Company the cost is ·0031d.; those supplied by the St. James and Pall Mall Company, ·00575d.; and those supplied by the Westminster Company, ·00234d. In the case of the gas lamps, the refuge lanterns, four incandescent mantles in Victoria-street cost ·00845d., Sugg's high-pressure lamps, incandescent mantles, ·00358d.; ordinary single burners, incandescent mantles, ·00627d.; ordinary flat-flame, ·00947d.; and ordinary flat-flame burners in Chandos-street, ·01307d. Thus it is seen that while the lowest total cost per candle-power per hour of the electric arcs is ·00234d., or 8·57d. per candle-power per annum, the lowest figures for gas lighting are ·00358d. or 14·1d. respectively. Similarly, the highest total cost per candle-power per hour for the electric arcs is given at ·00575d., or 14·9d. per candle-power per annum, as compared with ·01307d., or 47·65d., in the case of the gas lamps. These figures must come as a revelation to advocates of incandescent gas lighting, whose claims, on account of alleged lower cost, are to-day so often pressed upon local authorities charged with the responsibility of lighting the public highways. The figures are the more valuable because they include capital charges and extend over a considerable period of time.

Post Office Mains.—Lord Kinnaird in the House of Lords on Tuesday put an important question to the Government with reference to the laying of Post Office telegraph and telephone mains in the streets. The noble lord wanted to know whether, in view of the danger and inconvenience to the public stated to have been occasioned by the laying of Post Office mains under the public streets without due regard to existing pipes and drains, the Postmaster-General would, before commencing work in any street, cause notice to be served upon owners of existing pipes and mains of the intention of the Post Office to lay mains therein, and would conform with such reasonable requirements as might from time to time be made by the owners of such pipes and mains for the purpose of protecting them from injury; and whether the Postmaster-General would accept responsibility for the damage he might cause, in the same manner as companies having parliamentary powers to open up thoroughfares. Lord Balfour of Burleigh, in reply, said it was true that electric lighting companies had to give notice to local bodies before they opened the streets. As to the Post Office, it was under statutory restrictions, and the Postmaster-General would, if any specific case of damage was brought to his notice, give it his attention. Every procedure on the part of the Post Office in these matters was regulated by statute. There were three distinct requirements. First, the Postmaster-General was obliged to get the consent of the local authority, and he had to come to an agreement with that authority as to the method of carrying out the work. He had further, when it was resolved to open a street, to give notice so that the local authorities might have an opportunity of supervising the work. Then he had to give notice to any water or

Digitized by Google

gas company of any alteration which was intended in their pipes. It would be undesirable that any further restrictions should be placed on the Post Office in carrying out works for the public service. Many of the bodies who had put down wires and pipes had no legal right to do so; many of them were, in fact, trespassers. He must refer the noble lord for further information to the Telegraph Act of 1863.

Wireless Telegraphy Conference.—At the initiative of the German Emperor, the long-talked-of conference on wireless telegraphy has been opened in Berlin. On Tuesday representatives of Germany, Great Britain, France, Russia, Austria-Hungary, Italy, Spain, and the United States, assembled in the German capital, began proceedings within closed doors. The chief object of the conference is to arrive at an international agreement for the regulation of etheric telegraphy, with a view to harmonising the various competing systems. The subject is one which concerns the various wireless telegraphy companies no less closely than it does the Governments of the countries represented, but the conference will be strictly confined to the State delegates, and no representatives of companies operating certain systems or of inventors will have an opportunity of urging the claims of their respective systems. We take it that the decisions of the conference will be made public at some future date, and we await with interest its opinion as to the possibility of adopting an international and uniform system of telegraphy by etheric waves. Although the Marconi Company cannot take part in the conclave, it has endeavoured to make its voice heard through the correspondence columns of the *Times*. In Saturday's issue a long letter is published from Mr. H. Cuthbert Hall, managing director of the company, and the position he takes up may be fairly gauged from this remark: "It may be said generally, however, that the art of wireless telegraphy has not yet reached such a stage of development as to be ripe for the imposition of special rules and regulations for its working applicable to all systems; and that if rules and regulations are now laid down, with which the majority of persons working wireless telegraph systems can comply, the utility of the most advanced system will be enormously reduced." Mr. Hall's view of the whole affair is that the aim of the conference is to secure for a German company advantages which it has failed to obtain in fair business competition. The German Emperor recently urged the founders of the new German company to "exert all their influence to overthrow the monopoly which the Marconi Company is creating," from which may be understood the hostile attitude the latter has assumed towards the Kaiser's move. A great part of Mr. Hall's letter is a eulogy of the Marconi Company and the work it and its subsidiary companies has done during the past two years in organising a system of shore stations throughout the world for communicating with ships at sea. For this the company deserves all praise, and its success in such work is very widely recognised. At the same time the matters which have to be discussed by the conference are of an international character, wherein the interests of private individuals may not enter. Apart from the technical question, the Marconi Company contends that it would be a "commercial injustice" to compel it to put its organisation at the disposal of every ship carrying other wireless telegraph apparatus, and some scathing remarks are made by Mr. Hall about the "inferior apparatus" of companies which have not even "an elementary knowledge" of the business with which they are attempting to deal. The Marconi Company, naturally enough, perhaps, wants a monopoly of wireless telegraphy, and this is pretty freely indicated by Mr. Hall's rabid attack on the "so-called" systems of other companies, and everything else not labelled Marconi. Mr. Hall concludes by calling upon the representatives of the British Government at the conference "to resist any proposals which, whatever their purpose, tend artificially to deprive a British company of the advantages which it has fairly secured in open competition." There is little fear, however, that the English representatives will do their duty, and will not allow the interests of private individuals to supersede those of the country as a whole.

Electrolytic Estimation of Arsenic.—There is published in the issue of the *Journal* of the Chemical Society for the current month a long communication by Mr. T. E. Thorpe, C.B., F.R.S., on the electrolytic estimation of minute quantities of arsenic, more especially in brewing materials. The paper is evidently suggested by the report of a committee appointed as a result of a recommendation of the Royal Commission on Arsenical Poisoning. In their report the committee stated that of the various methods for the detection and estimation of the relatively small quantities of arsenic which may be present in beer, they were of opinion that those methods which depend on the conversion of the arsenic into hydrogen arsenide, and the subsequent deposition of the arsenic in the elementary form by heating the gas, are, on the whole, to be preferred. The hydrogen arsenide may be formed in practice by the action of so-called "nascent" hydrogen on the arsenic present. The hydrogen may be evolved either electrolytically or through the agency of dilute hydrochloric acid on zinc admixed with or containing such an amount of copper or other suitable metal as to give rise to a sufficiently rapid evolution of the gas. The amount of arsenic deposited by heating the hydrogen arsenide so formed is then determined by comparison to deposits obtained in precisely the same manner from wort, beer, malt extracts, sugar solutions, etc., containing known quantities of arsenic. The author describes an electrolytic method in detail, and arrives at a number of conclusions in which he sets out the advantages of adopting electrolytic means of detecting arsenic. In the first place it obviates the use of zinc. Simple in execution, it is under perfect control, and may be carried out under such conditions that the results obtained by different operations are strictly comparable, inasmuch as with a current strength of fair regularity the evolution of the gas is practically constant and uniform. The whole of the solution to be tested may be added to the apparatus at once, so that during the whole time of testing the arsenic is under the influence of the "nascent" hydrogen. It has been established that such amounts of arsenic as are present in beer or its ingredients are evolved as hydrogen arsenide during the 30 minutes occupied by the tests. The nature of the material associated with the arsenic is found to exercise no inhibiting effect on the formation and evolution of the hydrogen arsenide. Aqueous extracts of malts and worts may be added directly to the electrolytic apparatus without previous destruction of the organic matter as required by the zinc and acid process. Another advantage of the electrolytic method is that the deposits obtained are more uniform in character than those furnished by the zinc and acid method, and admit, therefore, of more accurate quantitative comparison. Lastly, the process allows of the simultaneous execution of a number of estimations of arsenic, depending on the arrangement of the rheostat. There are two disadvantages of the method, which the author gives as follows: first, the initial cost of the apparatus as compared with that employed in the zinc and acid method, and, second, that it can only be applied when an electric current of sufficient intensity is available.

THE DESIGN OF EXTRA HIGH TENSION SWITCHGEARS.

BY W. E. WARRILOW.

(Continued from page 111.)

A similar type of switch for two-way purposes is illustrated in section by Fig. 12, and in this instance the tanks

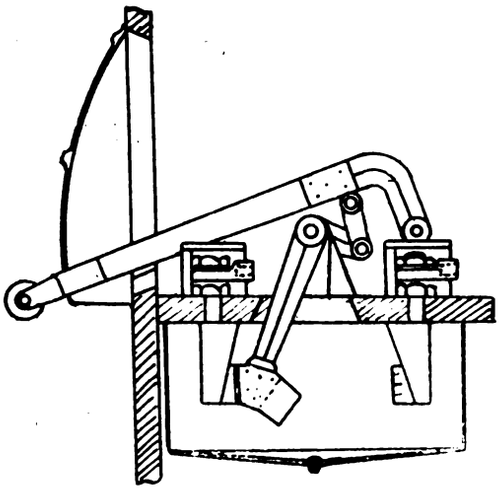

FIG. 12.—Stanley Double-Throw Switch.

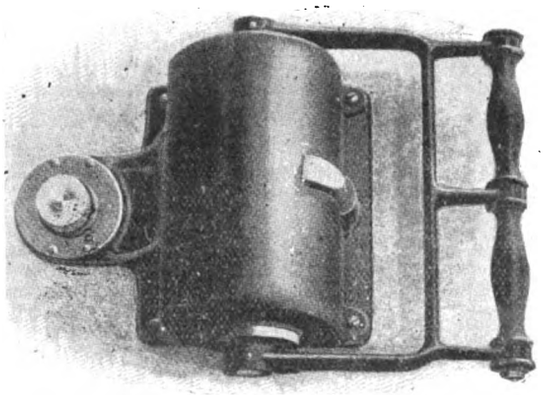
are arranged in tandem, the operating being still carried out from one main lever. These switches are made for



Front View of Switch, showing handle and time-limit screw.

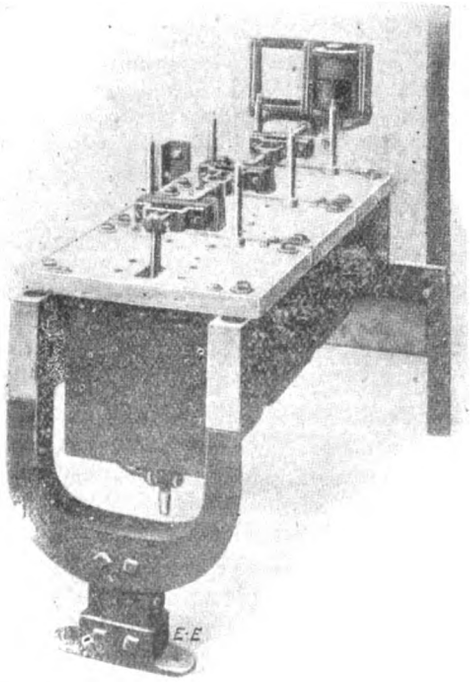


FIG. 13.—Stanley Three-Phase Switch mounted behind panel, showing tripping solenoids.

capacities of from 100 to 1,000 amperes, and for pressures varying between 4,000 and 15,000 volts. The oil tanks are porcelain lined in each case, and the placing of each pole in a separate tank prevents leakage between the conductors through the oil. When it is required to open

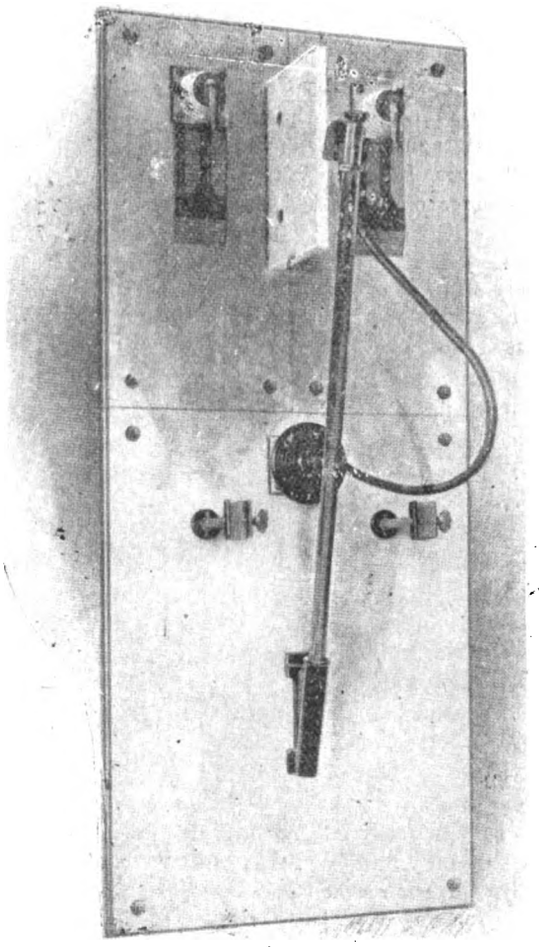

FIG. 14.—E.H.T. Flare Switch (Stanley Company).

the circuit automatically, a tripping solenoid is fitted to the mechanism, this taking the form of a small coil mounted on the back of the front marble slab, as shown

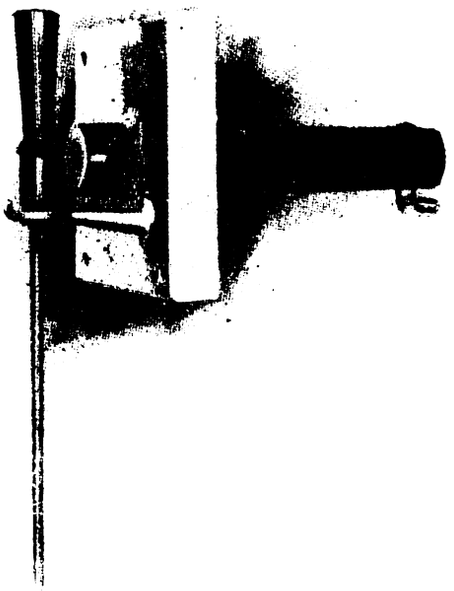

FIG. 15.—E.H.T. Plug Switch (Stanley Company).

in Fig. 13. The general assembly of this switch can be well seen from this figure, the small pillars standing up from the marble bases being the terminals. The operating

Digitized by Google

handle of this type of apparatus is fitted with a time-limit device, and the small milled head to be seen under the handle permits the adjustment of this within a certain range.

For extra high voltages and small currents the Stanley Company make a plug switch, which is simplicity itself,

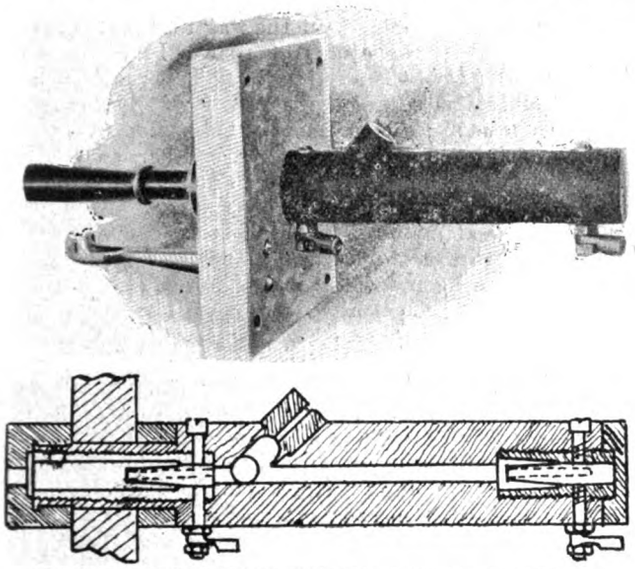

FIG. 16.—Stanley Stab Switch.—Side View of Plug Switch and Section through same.

and is said to be reliable in action. The circuit is broken in air, and provision is made for the drawing out of a long flaring arc, which is increased until it can no longer be maintained across the gap. Fig. 14 is a photograph of a double-throw switch of this design, the contacts and operating rod being mounted, as in the foregoing examples, on marble slabs, behind which all connections are made. One contact of the switch is mounted high up on the slab, and well insulated from it by porcelain, and the other is connected to a length of flexible cable, terminating in a contact fixed at the end of a long rod. This contact is designed to hook over the fitting at the top of the gear, and in both instances the terminals are tipped with zinc. Where the lower end of the flexible is fastened to the board a receptacle is provided, which allows of the entire handle and connection being removed when required, so that the circuit can not be again made until the plugging end of the cord is inserted. A locking device is also fitted, which prevents the circuit being broken at the fixed end of the flexible. When breaking the circuit, the handle, which is clipped in a holder when the switch is in, is unfastened, and when firmly grasped in both hands is lowered quickly from the top terminal, and the arc which is at once formed is drawn out to considerable length by swinging the rod back over the shoulder. The attendant then moves away from the board until the circuit is ruptured. When not in use the handle is dropped into a socket on the lower slab.

A small switch for light capacities up to 7,000 volts is illustrated by Fig. 15, which shows a front view of the device with the handle in its holder. The switch comprises two terminals fixed at each end of a fibre tube, these contacts being joined together by the rod when it is required to close the circuit. The connecting rod, in its passage down the tube, raises a small marble ball into a pocket, and upon the withdrawal of the rod this ball falls into the tube and smothers the arc which is drawn out between the rod and the contact at the end of the tube. This design of switch is very effective for small currents, but it would only be really safe when used for closing a circuit one side of which was "dead," otherwise, if both contacts were "alive," the rod would become charged directly it was inserted in the forward contact, and should the attendant's hand slip over the guard washer—a very likely occurrence—disaster would probably result. A back view of the device and a section through the same are shown in Fig. 16, and the above point is clearly exemplified from examination of these.

When controlling large powers at extra high voltages the switches are mounted some little distance from the operating face of the board, and are also pitched farther apart to ensure absolute safety in operation. Air break switches and fuses may answer the purpose for circuits of low power, but when the output is increased and the apparatus in the line is likely to set up varying potential stresses, reliance can no longer be placed on the air as a breaking medium, and recourse must be had to oil, both for switches and fuses. Fig. 17 illustrates a complete switchgear for controlling the high and extra high voltage sides of a transformer supplying a rotary converter, the direct-current gear being also included on the same frame-

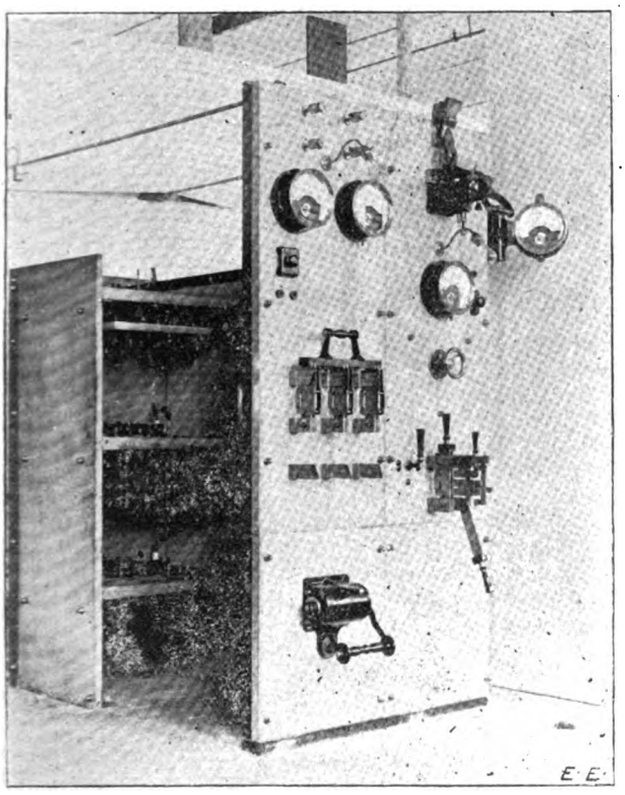

FIG. 17.—Lever Control Gear, with switches mounted behind (Stanley Co.)

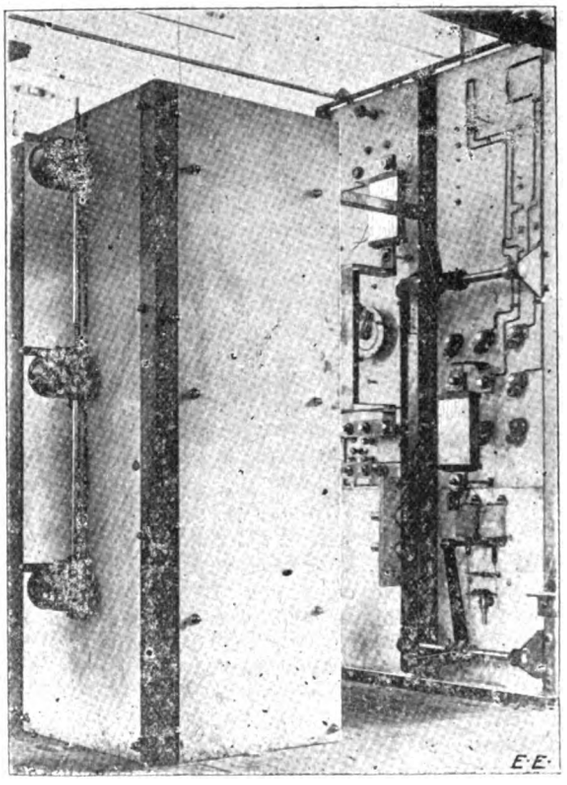

Back View of Lever Control Gear.

Digitized by Google

work. The extra high tension switches are fitted in a cubicle formed of marble slabs, each switch being complete in itself and secured to a marble shelf arranged horizontally in the frame. The moving contacts are operated from one handle placed low down on the face of the board, and each switch has a horizontal rod which transmits the motion to the switch proper, turning the contact arm in a circular manner. Fig. 17 is a back view of the same set of panels, from which the connections of the working face can be discerned, also the cubicle and the rods for actuating the switches. The tripping solenoid connected to the secondary of a transformer is bolted to the lower right-hand slab above the fulcrum of the large switch lever. The terminals and contacts for the secondary leads from the converter feeding the rotary are fitted above the section containing the extra high tension switch handle, while to the extreme left are to be noticed the couplings of the direct-current side of the rotary. The complete arrangement is designed for the supplying of rotaries from long-distance transmission lines, each machine having its own set of gear, which provides for the running up of the converter from the low-tension alternating side of the transformer, this having tappings brought out for the purpose to get half speed. The normal voltage is then applied by changing over the starting switch to a position in which all the windings of the secondary are made use of. The arrangement permits of steady running on the part of the rotary, but the absence of 'bus bars make it essential that the plant be always in good working order, as interchange of current is impossible.

(To be continued.)

RADIUM AND OTHER RADIOACTIVE SUBSTANCES WITH A CONSIDERATION OF PHOSPHORESCENT AND FLUORESCENT SUBSTANCES. THE PROPERTIES AND APPLICATIONS OF SELENIUM AND THE TREATMENT OF DISEASE BY THE ULTRA-VIOLET LIGHT.*

BY WILLIAM J. HAMMER.

(Continued from page 52.)

Within the past month great interest has been attracted by the statement made by Profs. Curie and Laborde that radium maintains its own temperature at 1·5deg. C. above its surroundings, this being equivalent to stating that ½lb. of radium salt would evolve in one hour sufficient heat to equal that caused by the burning of one-third of a cubic foot of hydrogen gas; and that the heat evolved from pure radium salt is sufficient to melt more than its own weight of ice every hour. This evolution of heat, it is claimed, is going on constantly for indefinite periods and leaving the radium at the end of months of activity as potent as it was at the beginning. The problem, therefore, confronts the world of solving how radium can constantly throw off heat without combustion or without chemical change, as Prof. Curie says it does. Messrs. Curie and Laborde employed a thermo-electric couple of iron and constantin, one of whose junctions is surrounded by radioactive barium chloride and the other by pure barium chloride. They used two small bulbs of the same dimensions, one containing 1 grm. of radiferous barium chloride containing about one-sixth of its weight in radium chloride and the other bulb containing 1 grm. of pure barium chloride. The junctions of the thermo-electric couple are respectively placed in the centre of each bulb, surrounded by the substances. The bulbs are isolated in air within the centre of two small identical enclosures, surrounded in turn by a third, which is thermally insulated, and maintains itself at a practically uniform temperature, and under these conditions variations in the surrounding temperature are felt in the same manner at both junctions, and do not affect the indications of the couple. Messrs. Curie and Laborde both thus observed a difference of temperature of 1·5deg. C. between the radiferous barium chloride and the pure barium chloride, the former having the higher temperature. (*Comptes Rendus*, March 16, 1903.)

In a letter recently received by the author from Prof Curie bearing upon the question of heat given off by radium, Prof. Curie writes as follows: "Since the time I had the honour to see you at our School of Physics and Chemistry I have continued to investigate into the radio-activity induced by radium and the way that radioactivity is disappearing in the course of time. In a study of another kind (in collaboration with M. Laborde) I found that the radium is setting off heat continually and in a very large amount; each gramme of the radium is setting off in each hour 100 small calories, or, in other words, it is setting off heat enough to melt in each hour its own weight in ice. Where is the source of this energy? Both Mme. Curie and myself are not able to go beyond some hypotheses. One of these consists in supposing the atoms of radium evolving and transforming into another simple body, and, despite the extreme slowness of that transformation, which cannot be located during a year, the amount of energy involved in that transformation is tremendous. The second hypothesis consists in the supposition that radium is capable of capturing and utilising some radiations of unknown nature which cross the space without our knowledge." Profs. J. J. Thomson and Rutherford advance the theory that there is a succession of chemical changes going on causing the spontaneous projection of larger masses of material at enormous velocities, and that while certain portions are constantly dying out and becoming inert, other portions are constantly increasing in strength and power. Someone has remarked that for years we have been extracting uranium oxides, and pouring down the waste-pipes and into the dustbins the more interesting and precious radioactive substances.

Although radium, polonium, and actinium have been termed new elements, in the case of polonium and actinium they have not yet been found in sufficiently pure state and in sufficient quantity to give a spectrum, and to prove conclusively that they are new elements. Prof. Curie has, however, stated emphatically that there is now no doubt of radium being a new element. The tiny brown bulb which I hold in my hand is the duplicate of the one which Prof. Curie showed me at his laboratory last fall, which contained the only sample of chemically pure radium in the world, this being between two and three one-hundredths of a gramme; and it was the spectrum of that sample, showing only the lines characteristic of radium, as tested by Demarcay, which demonstrated it to be a new element. And with this sample, also, the atomic weight for radium of 225 was determined. The atomic weight of the barium heretofore always associated with radium, but which in this sample had been eliminated, is but 157. In answer to my enquiry as to its value, Prof. Curie said that 100,000fr. (20,000dol.) could not purchase this tiny sample. I was enabled through the courtesy of Prof. Curie to secure from the Société Centrale des Produits Chimique of Paris some nine different preparations of radium and two of polonium, which I have here for your consideration. I was unable to secure any actinium; in fact, but a trace of this substance has thus far been secured. If the lights are extinguished, and you will sit for a few moments in the dark, I will pass these tubes about the room that you may observe the bright light given off by certain of them. These samples which I have range from 40 times the radioactivity of uranium (which is taken as a standard) up to 7,000. The laboratory where these substances are prepared is under the control of Prof. Curie, and up to recent date all radium of higher radioactivity than 7,000 has been retained for the experiments of M. and Mme. Curie and their associates, but I received a letter recently from Director P. Boulay, of the Société Centrale, in which I was informed that they will shortly put upon the market a preparation of radium, chemically pure, or nearly so, at a cost of 30,000fr. (6,000dol.) per gramme, or about 2,771,555·90dol. per pound.

Radium, while it has been spoken of as a metal, has never been secured in a metallic form, the usual form being as a chloride or bromide. Prof. Curie told the writer that

*A lecture delivered at a meeting of the American Institute of Electrical Engineers and the American Electrochemical Society, New York, April 17, 1903.

Digitized by Google

the result of all the work done in Germany and France in the past three years had only resulted in the securing of about 1lb. of radium, this including all grades or qualities. Prof. J. J. Thomson says there is far more gold in sea-water than there is radium, polonium, or actinium in pitch-blende. Prof. Curie took this ring which I have on my hand, which contains a small diamond, into his dark room, and holding near it a small pill-box containing about a gramme of radium, caused the stone to phosphoresce most beautifully. It was as if a lightened candle had been brought near to it. Prof. Curie remarked that this showed that the stone was a genuine diamond, and if it had been paste there would have been no effect produced, and that radium, therefore, constituted an excellent means for testing the genuineness of diamonds. According to M. and Mme. Curie, radium rays act in many ways like light. They reduce silver salts, peroxide of iron, and bichromate of potash in presence of organic substances; they also colour glass, porcelain, and white paper, and they transform greenish-yellow platino-cyanide of barium into a brown variety. Giesel had prepared platino-cyanide of barium with a trace of radium. This spontaneously became brown, and it then polarised light like tourmaline. He also found that this coloured rock salt just as cathode rays do, or the vapours of alkaline metals, and furthermore showed that radium salts brought near the temples or to the closed eyes produced a sensation of light.

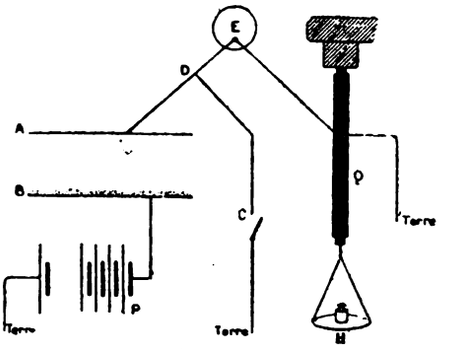

FIG. 4.—Apparatus employed by M. and Mme. Curie in the study of radio-activity.

M. Becquerel, referring to the chemical action of radium rays, says that radium and uranium rays act upon silver gelatino-bromide, but produce no effect upon Daguerre plates, or upon photographic papers, and says that colorations of glass, porcelain, paper, and certain crystals, as well as the painful physiological effects, also belong to this class of phenomena. He also calls attention to the transformation of white into red phosphorus in 24 hours, the reduction of mercuric chloride in the presence of oxalic acid with the precipitation of calomel, and finally the destruction of the germination power of seeds after long exposure. Becquerel also shows that radium rays possess the same power as the electric spark, or the prolonged action of violet or ultra-violet rays, of restoring the phosphorescent properties under exposure to heat of a body deprived of them by overheating. Practically all the radium which has thus far reached this country, with the exception of that in the possession of the author, has been the German radium, and Prof. Curie tells the writer that he had tested all of the German productions, and he has found none of them to exceed a radioactivity of 300. De Haen, of Seelze, near Hanover, Germany, and Giesel, of Brunswick, also have manufactured radium. De Haen recently informed the writer that the preparations he put on the market cost 10s. and 30s. per gramme. As indicative of the enormous difficulties to be encountered in procuring this wonderful substance, it is interesting to note that it takes 5,000 tons of uranium residues to produce a kilo (2·2lb.) of radium; and the cost of handling these residues is 2,000dol. per ton. To secure the chemically pure radium is enormously expensive, and it would be impossible to do this by chemical analysis; therefore, the far more sensitive electrical method is employed, and the Curies say that they can detect the presence of a radio-active substance by the means of such a minute quantity that it would require 5,000 times this amount to show at all in the spectroscope. And it is stated that this method of electrical analysis is thousands of times more sensitive than spectrum analysis and millions of times more sensitive than chemical analysis.

In Fig. 4 is shown the "electrometer" method with which the Curies have studied the radioactivity of different substances. It consists of two plates, A and B, on the latter of which is placed the radioactive substance to be tested. This makes the air a conductor of electricity between the two plates, and for measuring this degree of conductibility the plate B is brought to a high potential by connecting it to one side of the storage battery, P, the other side of which is connected to the ground. If the plate A is brought to the potential of the ground by the wire, C-D, an electric current begins to flow between the two plates, A and B. The potential of plate A is shown by the electrometer, E. If we cut this communication with the ground at C, the plate A becomes charged, causing the electrometer to deviate. The speed deviation is proportionate to the intensity of the current, and can serve for measuring it. But it is preferable to make this measurement by compensating the charge taken by plate A, so that the electrometer remains at zero. The charges, which are extremely feeble, can be compensated by means of a Piezo-electric quartz, Q, one armature of which is connected with the plate A, and the other armature grounded. The quartz plate is given a certain tension by weights placed on the plate H. This tension is gradually produced and gives a charge of a definite quantity of electricity which can be measured. The operation may be so regulated that there is a constant compensation between the quantity of electricity which passes through the condenser and that of the opposite sign furnished by the quartz. So we can measure in an absolute value the quantity of electricity passing through the condenser in a certain time. Doubtless some loss is caused by the rays which pass directly through the condenser plates

(To be continued.)

NOTES ON WHAT AND HOW TO LEARN IN AN ELECTRICAL ENGINEERING WORKS.

BY G. RALPH.

The following rough notes have been put together in the belief that they may be of assistance to apprentices going through the various departments of an electrical engineering works, by directing their attention to important points they should look out for in any department.

To become acquainted with any business, particularly in all branches of engineering, it is extremely important that an apprentice should learn the *reasons why* things are done in a certain manner, as well as learning how to actually *do* them. It may here be said that unless an apprentice shows a keen interest in the work which is going on in the department in which he is engaged, it is quite certain that the foreman will not interest himself in the apprentice, nor will he take the trouble to explain things. But if a proper interest be exhibited, everyone, from the manager and foremen downwards, will be found always ready and willing to impart information. Of course, a judicious time should be chosen in asking information from the foremen or men. It is *not* the right time to ask when one can see plainly that the party is engaged on something which is demanding his whole attention at the moment.

A most excellent little book dealing fully with what and how to learn in an engineering works was published by Messrs. E. and F. Spon, entitled "Workshop Manipulation," by Richards. This book ought to be in the hands of every engineering apprentice, but, being out of print, can probably only be obtained now through a second-hand bookseller. The following are a few of the more important points which the apprentice should notice and think about in the various departments.

Machine Shop.

1. The importance of marking out work on the marking table before machining operations are commenced.

2. The cutting speeds of various classes of tools, such as lathes, boring machines, planers, etc.; also the difference in speed for different materials operated upon.

Digitized by Google

3. The special tools used for boring bearing brasses, etc.
4. The importance of the use of gauges for accurate work and interchangeability.
5. Think out the reasons which probably determine whether a certain piece of work shall be done on a particular class of machine, when it is possible to do it in several different ways.
6. The angles of the cutting edges of tools.

The Foundry.

1. The way moulds and cores are ventilated.
2. The importance of making that part of the casting which must be perfectly sound and free from dirt the bottom side of the mould.
3. See at which point the metal is run to a casting, and why it is better at one particular place than another.
4. The various qualities of brass and gunmetal best adapted for certain classes of castings.
5. The dressing of moulds to obtain a smooth, clean surface.

The Pattern Shop.

1. The amount of allowance for "machining" being left on various sizes and classes of castings.
2. The amount of taper to allow of patterns being easily withdrawn from the moulds.
3. The amount allowed for "shrinkage" or contraction for castings in various sorts of metals.
4. How core-boxes must be made to take to pieces easily to remove the loam cores.
5. How cores are to be supported and located by "prints."
6. Think how the casting will probably be moulded, which side down, and where the joint in the mould will be; the reasons will then be seen for coring out certain parts, or leaving bosses or other parts loose on the pattern, so that they be drawn out of the mould after the body of the pattern has been removed.

The Fitting and Erecting Shop.

1. The marking off of bed-plates for dynamos and motors.
2. The fitting of keys in armatures, couplings, etc.
3. The building of armature cores.
4. The saving of time which is effected when the various parts of a machine are made accurately enough to require very little fitting together.

The Brass-Finishing and Instrument Shop.

1. The various classes of switchboards and arrangement of switches and connections upon them.
2. The construction of switches and various means adopted to secure good contact between the jaws.
3. The construction of commutators and the care necessary in insulating them.
4. The connections and terminals of dynamos and motors.
5. The construction of projectors and arc lamps.
6. Fittings adapted for use at various classes of installations, ships, collieries, mills, etc.

Capstan-Lathe, and Milling Shop.

1. The form and arrangement of tools in the turret.
2. The enormous saving of time in making quantities of small parts on these machine tools over making them by hand in the ordinary brassfinisher's lathe.
3. The variety of work which can be performed on a universal milling machine.
4. The importance of doing repetition work by milling instead of by hand filing or grinding.
5. The speed used in milling different materials.

Tool Shop.

1. The degree of hardness to which tools are "tempered" for various purposes.
2. Methods of hardening, the heating, cooling, and tempering.
3. The angles to which tools are ground for turning, planing, and boring, etc.
4. Methods of grinding milling cutters, taps, reamers, etc.
5. Various forms of jigs and templates for repetition work on milling and drilling machines.

Steam Testing Shop.

1. The arrangement of steam-pipes and reducing valves, drain pipes, etc.
2. The arrangement for lubrication on various makes of engines.
3. Various forms of governors, how they act and within what limits they will govern.
4. Indicating and working out the horse-power of engines.

The Winding Shop.

1. The various classes of material used for insulation and the thickness of the same for various purposes.
2. The importance of leaving plenty of length of surface to prevent leakage to earth in armature cores and slots, commutators, etc.
3. The method of making drum armature bars, formed coils, etc.
4. The form of end "crossings" in drum armatures, and how connected up.
5. How wires or conductors are insulated from each other to withstand high voltage.
6. Think out which are the weakest places in the various forms of armatures.

The Test-Room.

1. The usual tests for dynamos, temperature, speed, compounding, or variation of pressure in shunt-wound machines.
2. The usual tests for motors, also brake tests for efficiency.
3. The testing of two identical machines for efficiency by the "Hopkinson" method.
4. The various classes of instruments used in making the tests, and the principles upon which they work.
5. Methods of calibrating instruments.
6. Methods of regulating the speed of motors.

Installation Work.

1. The difference in arrangement of lights for various classes of buildings, etc.; amount of light per square foot of ground area.
2. Various methods of running wires—in casing, iron pipes, steel conduit, lead-covered, etc.—and the classes of work to which each is specially applicable.
3. Methods of jointing small wires, large cables, etc.
4. In motor work, notice the various forms of gearing employed for reducing speed and applying the motor to drive machinery.
5 The special classes of work best adapted for (1) series motors, (2) shunt motors, (3) compound motors.
6. The amount of power required for driving various classes of machinery.
7. Notice the engine and boiler plant at various works, the arrangement of steam-pipes, pumps, feed-heating, etc.

The Drawing Office.

1. Pay particular attention to the importance of being able to make hand sketches, properly dimensioned, quickly from existing machinery.
2. The importance of dimensioning drawings in such a way that the dimensions can be easily found. Look at the matter from the workman's point of view, and give all dimensions necessary for a man to complete the job without having to add up or subtract several dimensions.
3. When designing anything new, endeavour to avoid unnecessarily small fractional parts of an inch. Make things to even dimensions, if possible, without resorting to $\frac{1}{16}$ths, $\frac{1}{32}$nds, and $\frac{1}{64}$ths.
4. There are generally several ways of making a thing. Aim at the most direct and simple from a manufacturing point of view.

In conclusion, part of the last chapter of Mr. Richard's book may very fitly be quoted:

"A mechanical engineer who has not been 'through the shops' can never expect to attain success, nor command the respect of even inferior workmen. Without a power of influencing and controlling others, he is neither fitted to direct construction, nor to manage details of any kind connected with engineering industry . . . No one can expect to prepare successful designs for machinery who does not understand the details of the construction . . .

Digitized by Google

"Some hints will now be given relating to apprentice experience in a workshop.

"Upon entering a shop, the first thing to be done is to gain the confidence and respect of the manager or foreman who has charge of the work. . . . To command the confidence of a foreman one must be punctual, diligent, and intelligent. . . . The least word or act which will lead workmen to think that an apprentice is indifferent at once destroys interest in his success, and cuts off one of the main sources from which information may be derived.

"Punctuality costs nothing and buys a great deal: a learner who reaches the shop a quarter of an hour before starting time and spends that time in looking about manifests thereby an interest in the work, and avails himself of an important privilege—one of the most effectual in gaining shop knowledge. Ten minutes of his own time spent in walking about, noting the changes wrought in the work from day to day, furnishes constant material for thought, and acquaints a learner with much which would otherwise escape his attention. It requires, however, no little care and discrimination to avoid a kind of resentment which workmen feel in having their work examined . . . where such inspection is thought to be prompted by curiosity only. The better plan in such cases is to ask permission to examine work from the person concerned, and such an application will generally secure both consent and explanation.

"Politeness is as indispensable to a learner in the works as to a gentleman in society. The character of the courtesy may be modified to suit the circumstances and the person, but still is courtesy. . . . Without the art of questioning but slow progress will be made in learning shop manipulation. . . . The main point is to consider questions before they are asked, make them relevant to the work in hand and not too many. . . . It is important in asking questions to consider the mood and present occupation of the person addressed. . . . One question asked when a man is in a communicative humour is worth a dozen questions when he is engaged and not disposed to talk. It is a matter of courtesy in the usages of a shop, and one of expediency to the learner, to ask questions from those who are supposed to be best informed on the subject to which the questions relate. . . . There is not a more generous or kindly feeling in the world than that with which a skilled mechanic will share his knowledge with those who have gained his esteem, and who, he thinks, merit and desire the aid that he can give. . . .

"If asked for advice as to the most important object for an apprentice to aim at in the beginning of his course, nine out of ten experienced enginesrs will say, 'To do work well.' . . . Methodical exactness, reasoning, and persistence are the powers which lead to proficiency in engineering pursuits. There is, perhaps, no more fitting conclusion to these suggestions for apprentices than a word about health and strength. . . . One not accustomed to manual labour will, after commencing, find his limbs aching, his hands sore. He will feel exhausted both at the beginning and at the end of the day's work. These are not dangerous symptoms. He has only to wait until his system is built up so as to sustain this new draught upon its resources, and until Nature furnishes a power of endurance, which will in the end be a source of pride and add a score of years to life. Have plenty of sleep, plenty of plain substantial food, keep the skin clean and active, laugh at privations, and cultivate a spirit of self-sacrifice and pride in endurance that will court the hardest and longest efforts. An apprentice who has not the spirit and firmness to endure physical labour and adapt himself to the conditions of a workshop should select some pursuit of a nature less aggressive than mechanical engineering."

THE VERBAND DEUTSCHER ELEKTROTECHNIKER.

The Parallel Running of Alternators.

BY H. GÖRGES.

(Continued from page 172.)

We will now assume that the input of energy is not constant, but fluctuates uniformly in each cycle of the driving engine, however complicated this may appear. We can then represent the curve of driving energy by the sum of a series of sine curves, of which the first lasts through a complete cycle, the second being of half and the third of a third this duration, etc. The individual sine oscillations, therefore, bisect the zero point at different periods—that is to say, they have a definite relative phase distortion. We term the first oscillation the main one, and the rest the superimposed oscillations. The law of superposition serves for all the oscillations which we have to consider here—in other words, each oscillation behaves as if it existed alone, and we find the resultant oscillation by summing the values of the individual oscillations at each instant. This law applies equally to all the oscillations of the driving engine, as also for the natural oscillations set up in the armature, which follow a simple sine law. By means of this law our investigation will be greatly simplified, since we need take into consideration only one sine oscillation at a time.

The fluctuations in the output of the driving engine cause mechanical oscillations in the dynamo—that is to say, lead and lag. If only one dynamo is coupled to the 'bus bars, obviously these oscillations will observe the same cycle as the primary oscillations. In order to distinguish between the mechanical oscillations and those having their origin in the dynamo itself, we call the former forced oscillations. If a damping effect is provided by asynchronous motors, these oscillations will be checked in the rapidity of their succession and weakened, but never completely eliminated, as in the case of the natural oscillation of the machine.

Comparing the main oscillation with the superimposed ones, it is obvious that the influence of the former at equal strength must be the greater, because its swing is longer than those of the superimposed oscillations. Hence, for the same absolute amount the main oscillation will produce a greater variation of the speed than a superimposed oscillation, and will tend to a greater increase of the lead or lag. This explains the oft-proved fact that the curve which represents the periodic value of the lead and lag approximates very closely to a sine curve based on the period of the main oscillation. The main oscillation has, therefore, an important bearing on the whole phenomena. The greater its frequency the less will be the effect of the superimposed oscillation. Relative to the variations in speed, which must be considered in connection with the damping effect, the first superimposed oscillation has half and the second a third of the influence of the main oscillation; while relative to the lead and lag, which, apart from the damping, govern the output yielded, the influence of the superimposed oscillations sinks to the fourth and ninth part, and so on. As we have already seen, the speed must increase so long as there is an excess input. It will therefore be at its maximum if the acceleration has been positive and just reaches the zero value. In the sine curves of the cycle we see that the speed is retarded during a quarter of the whole period relative to the acceleration. The lead must also increase while the speed remains above the normal. The variation from the normal position suffers also a retardation for a quarter of the period relative to the speed, and therefore a retardation of one-half period relative to the acceleration. Hence the maximum input of energy from the driving engine corresponds to the greatest lag of the armature, and the minimum input to the greatest lead of same. This circumstance is of great importance in connection with parallel running, for, apart from the damping effect, the load is greatest for the maximum lead. Hence minimum input and maximum output coincide, and conversely. Consequently the oscillations which occur when a machine is running independently, must be aggravated when machines are run in parallel. But when we remember that the cause—*i.e.*, the variations in the input—are repeated in the same cycle, the oscillations to which they conduce must also be repeated in exactly the same order. In parallel running we, therefore, have forced oscillations, which, compared with those which occur in separate running, appear to be strengthened. This strengthening we term resonance. The resonance modulus depends very much upon the difference of the square of the forced snd the number of undamped oscillations pro-

Digitized by Google

duced in the armature. It will be the greater in proportion as the difference between the two values for the oscillations is smaller, and will be indefinitely great if the values coincide. In the latter case we speak of complete resonance. It must be observed that the resonance is governed by the number of oscillations set up in the armature and remaining undamped, apart from whether damping really exists or not. We must prevent marked resonance, especially complete resonance, both in the case of the main oscillation and that of one of the superimposed oscillations. If the value for the natural period of oscillation be greater than that for the main oscillation of the driving engine, then resonance with it or with some of the harmonics is inevitable. Hence we get the practical rule that the value for the natural oscillations shall be less than that for the main oscillation. If the resonance with the latter is slight, it will be much more so with the superimposed oscillations. The number of oscillations can be best reduced by increasing the moment of inertia. Consequently resonance may be prevented with certainty by designing to get a sufficiently large moment of inertia.

The number of natural oscillations for a certain type of construction is practically independent of the output and speed of the dynamo. The value is approximately the same for each size, and lies between 2·5 and 1·5 oscillations per second. We will assume that all machines of a certain type of construction give 1 5 natural oscillations per second. A steam-engine running at 150 revolutions gives 2·5 main oscillations in the same time. In this case the resonance will be but slight. At 125 revolutions the number of oscillations will be 2·08d., making the resonance more appreciable, while at 100 revolutions the oscillations will be 1·67 per second. In the latter case the danger of resonance is very considerable. Complete resonance occurs at 90 revolutions—parallel running at this speed would, therefore, be quite impossible. We have assumed in making the above calculations that the steam-engine has no special flywheel. If such be provided or should the dynamo be of the flywheel type, then the number of natural oscillations will be less and the danger of resonance corresponds to a lower speed. This explains the fact that with the same degree of variation very good parallel running has been obtained in many cases with tandem machines, where, for instance, triple-expansion engines without special flywheels have given trouble. In any case it is sufficiently obvious that the difficulties increase rapidly with decreased speed.

Referring again to the law of the superposition of the oscillations, we may at once combine the different oscillations. The forced oscillations, more or less strengthened by resonance, combine with the natural oscillations to form a resultant curve which may assume a very complex character. Since we may assume that the numbers of oscillations are different—as otherwise the resonance would become infinitely great, thus causing the machines to fall out of step—the maximum values of the different oscillations will soon meet. As a result, lead and lag will be aggravated, and the maximum of the one oscillation will soon meet the minimum of the other, the resultant oscillation appearing small. We call this phenomenon interference of the oscillations. If the two kinds of oscillations are maintained permanently side by side, then strong and weak oscillations will be exchanged between them alternately at regular intervals. This give and take between the oscillations we term surging, and we can determine the ratio between the oscillations from the number of beats while surging is taking place. We have seen that the damping always eliminates the natural oscillations after a time. Hence, if they are not again excited by some cause or other, there will remain after a time only the forced oscillations, and the surging must cease.

We have also seen that by designing to obtain a sufficiently great moment of inertia, the danger of resonance may be avoided. But under certain circumstances this involves the provision of very heavy flywheels, so the question arises whether the danger cannot be eliminated by the provision of damping, whereby the oscillations are also reduced. As a matter of fact, the damping first of all eliminates the natural oscillations, whose length of swing is quickly reduced by the damping, or which are prevented from coming into being at all by strong damping. The damping also exerts an influence on the forced oscillations. We can reduce them at will by damping, even when complete resonance exists. Hence we are able to confine the lead and lag within any limits we please, and thereby maintain synchronism in any case. The question arises, however, if some sort of disadvantages are not connected with this remedy. We have seen that of the input, part is absorbed by the flywheel and the remaining part, deducting the loss in the dynamo, transferred to the 'bus bars in the form of electrical energy. The amount of energy which can be absorbed by the flywheel at any moment, depends upon its moment of inertia and the acceleration at a given mean speed. If, however, the flywheel yields up part of this energy to the 'bus bars directly a variation occurs in the speed, then considerable variations in speed, and consequently great accelerations, will be impossible. The flywheel is rendered more or less ineffective by the damping, and the fluctuations of the electrical energy yielded at the 'bus bars become more and more a reflection, so to speak, of the mechanical input. If means are available to render the lead and lag visible to the eye, we shall find that they are diminished by the damping. At the same time we shall observe that, corresponding to marked variations of the input, the oscillations indicated on the watt-meter and ampere-meter are increased. We must, therefore, distinguish between variations in the speed and variations in the output yielded. The latter may be considerably increased by the damping. But strong variations in the output and current, apart from the bad effect on the parallel running, entails the disadvantage of greater heating in the machine, and the voltage at the 'bus bars may be adversely affected also. This unpleasant property of the damping becomes more marked according as there is less resonance during parallel running—that is to say, the closer the resonance modulus approximates to 1. In the case of a gas-engine-driven dynamo, which requires an extra flywheel effect, a strong damping is not useful as a rule, but injurious in its effect. In connection with steam-driven dynamos, cases have also come to my notice where the damping had an adverse effect on parallel running. Having regard to the above, a slight damping appears to me to be always advantageous, because it eliminates the natural oscillations. A strong damping will prove useful as a substitute for a special flywheel only if the energy transmitted by the driving engine be fairly constant, but as a set-off against this there is the danger of resonance.

(To be continued.)

THE DANGER OF SHOCK TO FIREMEN THROUGH SQUIRTING HIGH-TENSION MAINS.*

The supply of electricity to villages and isolated houses is often carried out by means of overhead wires, which are usually uninsulated. The wires are carried on insulators either supported by posts or attached to the walls of houses, etc. The overhead trolley wires of electric tramways belong to the same category. Should a fire break out in a street containing such wires, it would not usually be possible to switch the wires out of circuit before the work of extinguishing the fire commenced. Also, it is hardly desirable to put the road in darkness just during the time of danger, especially as there is no fear of explosion from the lighting agent.

In such cases the danger of shock to the firemen through the stream of water from the hose coming into contact with the wires must be considered, and the following experiments were carried out at the Charzow power station for the purpose of obtaining some definite figures on the subject. A stream of water at a pressure of five atmospheres was taken from a hose pipe, A (Fig. 1), with a 12mm. diameter mouth, and was directed at the bare wire, C, carried on well insulated supports. The full section of the stream was allowed to hit the wire. The voltage of the

* Abstract of an article by F. Heinicke in the *Elektrotechnische Zeitschrift* of June 18, 1903.

Digitized by Google

water, B, to earth was measured by means of a standard voltmeter, the copper mouth of the hose pipe being thoroughly insulated from earth.

The experiments were carried out with continuous and alternating currents and with various distances, L, between pipe and wire. As the quality of the water affects the results the tests were first carried out with the ordinary water from the town mains, which was rather hard and poorly conducting, and then with water containing ·5 per cent. of pure soda.

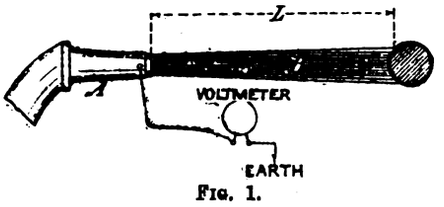

FIG. 1.

Experiments carried out by Prof. Weber in 1897 and Dr. Kath in 1899 (*E.T.Z.*, 1899, p. 601) show that a human being can just stand a current of ·03 ampere without fatal results. They also show that the resistance from hand to earth of a person standing on wet earth is at least 15,000 ohms. In order to determine the current which would pass through a human being holding the hose pipe, the method shown in Fig. 2 was employed; where e_1 = the E.M.F. measured by the voltmeter; i_1 and W_1 the corresponding current and resistance; i_2 and W_2 the current and resistance of the hose-pipe circuit; e_3 = the voltage between mouthpiece and wire; i_3 and W_3 the corresponding current and resistance; E = the whole voltage from wire to earth; J = current which would flow through a human being.

Then $i_3 = i_1 + i_2$, and $e_3 = i_3 \cdot W_3$;

$$W_3 = \frac{e_3}{i_3} = \frac{e_3}{i_1 + i_2} = \frac{e_3}{i_1 + \frac{e_1}{W_2}}.$$

The current in the hose circuit is given by $i_2 = \frac{e_1}{W_2}$, and $e_3 = E - e_1$, and by a separate measurement the resistance (W_2) of the hose circuit was found to be 5,000 ohms. The resistance of the water column is $W_3 = \frac{e_3}{i_3}$, and the combined resistance of the whole circuit, assuming a person with a resistance of 15,000 ohms to be holding the hose, is

$$W = W_3 + \frac{5{,}000 \times 15{,}000}{5{,}000 + 15{,}000} = W_3 + 3{,}750.$$

From this value and the total voltage, E, the value of i_3 is obtained, and then

$$J = \frac{i_3}{1 + \frac{W_1}{W_2}}.$$

So long as this value does not exceed ·03 ampere, the case may be considered safe.

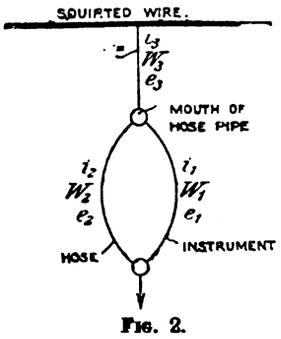

FIG. 2.

Experiment 1.—On a three-phase star-coupled circuit, with 6,000 volts between lines and the neutral earthed. The wires were bare and well cleaned. Each had a section of 95 square millimetres. The tests show that a distance, L, of 300mm. is sufficient for safety with pure water, whilst when ·5 per cent. of soda is added the distance, L, must be increased to about 1,000mm. before the current falls to 0·3 ampere. Though this removes the danger, an uncomfortable shock will certainly still be felt.

Experiment 2.—On a three-phase circuit with 125 volts between lines. In this case one of the mains, instead of the neutral, was earthed. Though the distance, L, was reduced as low as 30mm., the current never reached the limiting value, being only ·0024 ampere at 30mm. with pure water, and ·0073 ampere with ·5 per cent. of soda added.

Experiment 3.—On a continuous-current traction circuit supplied from accumulators at 550 volts with the negative pole earthed. With pure water the limit of ·03 ampere was not reached, even with a distance, L, of only 30mm., the actual current being only ·016 ampere. With ·5 per cent. soda in the water the limit was just reached at 30mm., and the current was ·026 ampere at a distance of 80mm.

Experiment 4.—With 240-volt continuous current the limiting value was not reached at all, though the distance, L, was reduced to 50mm., the current being only ·0076 with pure water and ·011 with ·5 per cent. soda solution.

From these figures it would seem that the danger from this source is not so great as is usually supposed, especially when it is remembered that such voltages as 6,000 are practically never carried on bare overhead wires.

PERMANENT-WAY CONSTRUCTION AND MAINTENANCE.

In our issue of July 17 last we referred to a report by Mr. John Young, general manager, Glasgow Corporation tramways, on "Permanent-Way Construction and Maintenance"; also to a summary of that report prepared by Mr. C. A. King, and read by the latter gentleman during the recent conference of the Municipal Tramways Association in Glasgow. Below we give a reprint of the summary in full:

PERMANENT-WAY CONSTRUCTION AND MAINTENANCE.

In Great Britain and Ireland the girder rail is the only rail in use on public streets. Note may be taken of the adoption by Hull of a girder rail with central groove. Several towns in America and on the Continent use the tee rail. Considerable diversity exists in the weight of rail used. For girder straight track rails the minimum recorded is 65lb. per yard and the maximum 105lb., but by far the greater number of systems adopt a rail weighing between 90lb. and 100lb. A large number of towns use a heavier rail on curves, in one instance the weight being 117lb. per yard. It is interesting to note that the lightest straight track section for tramway rails recommended by the Engineering Standards Committee is 90lb. per yard, and the heaviest 110lb. per yard.

Almost 50 per cent. of the systems have a rail 7in. deep, a considerable number having 6½in. and 6in. Except in America, where deeper rails are used, these limits are very rarely exceeded. It is of interest to find that out of every three tramway systems, two use rails with a flat head and one has the head coned.

The width of the groove on straight track rails varies on different British systems from 1in. to 1¼in., but only on seven systems is the groove wider than 1⅛in., this width and 1in. being by far the most common. In America 1⅜in. is in use on straight track. A large number of systems widen the groove on curves by about ⅛in. Norwich is unique in widening from 1in. on straight track to 1⅜in. on curves, and, what is worthy of note, state that they consider this too wide, and would prefer 1¼in. on curves.

About 35 per cent. of the tramways reporting use a specially high guard lip, on the curve of which the maximum height in this country seems to be ¾in. above the tread. Several systems use check rails on the sharper curves.

There has been some controversy as to the best length of rail to use. The returns show that at the present time 40 per cent. of the systems use 45ft. rails, the 60ft. rail coming a close second with 33 per cent. in its favour, the remaining 27 per cent. of the systems using shorter lengths than 45ft. Each length has its keen supporters, and the chief arguments in favour on each side are as follows.

Digitized by Google

Those who support 45ft. lengths say: most convenient to handle and turn, most easily curved, less movement than longer rails; also that the longer rail causes more trouble with paving, more undulatory movement and hog-backing, and acquires a permanent set by sagging with its own weight. Those who favour the 60ft. rail put forward as their main argument: fewer joints, and therefore less maintenance and less electrical resistance, and maintain that the extra difficulty in handling is very slight, and that this long rail sits quite as securely on its bed as its shorter rivals.

There is considerable variation in the gauges adopted. The most common is the railway gauge of 4ft. 8½in., but several systems have a 4ft. gauge, and about 20 use 3ft. 6in. gauge One or two systems have gauges peculiar to themselves. That this is an inconvenience is apparent to everyone, and in the future, as lines extend and in many cases join, this will be more acutely felt.

The tests which engineers require the rails to satisfy vary considerably in severity, but the nature of the tests is very similar. A given weight falling from a fixed height on a given length of rail resting on rigid supports placed at a specified distance apart must not produce more than a given maximum of distortion or permanent bending. This is known as the drop test, and is almost universal. In many cases this is the only mechanical test applied, but it is often accompanied by the ordinary tensile test with a specified elongation and contraction. A few specifications require, in addition to the drop test, the bending of a small bar cold, without fracture, or the bending of the rail to a small radius without showing any signs of cracking or rupture. A complete statement of tests will be found in the detailed table supplied to you.

The chemical composition specified by the different systems shows that a considerable difference of opinion exists among tramway engineers as to what is required. With regard to the carbon, which is the main constituent, one specification is as low as from ·28 to ·40 per cent., while another is as high as from ·55 to ·66 per cent. The average carbon aimed at in the majority of cases seems to be about ·53 per cent. Regarding the rail in its capacity as an electrical conductor, the percentage of manganese is of importance. One specification asks for an average of 1·10 per cent., and another specifies no more than ·1 per cent., showing a very wide divergence of opinion. The average quantity of manganese wished for in most cases appears to be about ·90 per cent., which certainly does not err on the low side. In several cases a high silicon is specified with a very high carbon, which, if obtained, would necessitate a careful handling of the rails. It would be interesting to have some records of the analysis of the actual rail as compared with the composition specified. Generally, the tendency is to specify a higher carbon rail than was formerly used.

After the rail itself, there is no more important problem which presents itself to the engineer than the method to be adopted in joining these into a continuous smooth-running road.

Having only comparatively recently adopted electric traction on a large scale, we in this country are realising to the full the very exacting demands it makes on the permanent way as compared with horse traction. Nowhere is this more in evidence than at the joints. The number and diversity of the devices used, as shown in the replies, is evidence of this. There are at least a dozen separate methods, and many combinations of two or more of these.

Of the replies received 30 per cent. rely on fishplates unaided, 23 per cent. combine these with anchor plates, and 21 per cent. use sole plates in addition to fishplates. Of the remaining methods of jointing, the most interesting is perhaps the cast weld joint, large adopted on four systems, two of those in America.

That few of the above have proved entirely satisfactory is shown by the large number of systems on which trials are being made of other forms of joint than at present in use on these systems.

In this connection, mention must be made of the chemical welding material "Thermit," lately put in the market. At least eight towns are at present experimenting with this device. At Dresden, on the Continent, and Leeds, in this country, the trials have been extensive, and both towns have reported very favourably. In Glasgow we purpose making a trial of several hundred joints this summer. The returns for cast-weld joints are curiously at variance. Of nine towns reporting as having tried this method in America—two were favourable and two unfavourable; on the Continent one was favourable and one unfavourable; in this country one favourable and one unfavourable; one made no comment. Only one city reported having used electric welded joints—Boston, U.S.; the result is stated not to have been a success. It must, however, be noted that these welds were made in 1893, at which time it is now admitted, even by the contractors, that the methods were defective. The Lorain Steel Company, of Johnstown, who own the welding plant, claim that the present method is a great advance on the practice of 1893, and this form of jointing is making considerable progress in America. It has been arranged to make a number of these joints also in Glasgow in the autumn.

Before passing from the consideration of welded joints, it may be noted that the present practice regarding the bonding of these is to put no bonds with chemical and electrical welds. With cast welds about 50 per cent. seem to bond in addition.

Apart from the question of joints, but to a certain extent connected with it, is the fixing down of the rails to the bed, not only at the end, but at intervals in the length. The tendency seems to adopt this much more largely in the future. Taking into consideration the increasing length and height of the rails and the close butting of the ends, this is undoubtedly a step in the right direction. The rails are close-butted at the ends on over 75 per cent. of the tramway systems under consideration.

A question of considerable interest and importance, affecting not only the permanent way, but also the rolling-stock and the overhead trolley wires, is the placing of the rail joints. Of the total systems reporting, two out of every three have the joints placed opposite each other. Taking especially into consideration the rolling-stock and overhead work, the writer believes this to be the best practice. At the same time the longer experience of some of the earlier systems has led them to adopt "Staggeral" joints. On most systems squared joints are not insisted on at curves, but where the fishplate adopted is long, the writer is strongly of opinion that on sharp curves the joints should be squared or far enough apart to get at least one tiebar between them, otherwise a knee at the joint will result.

The most important feature in special work is, without doubt, the points, and more especially the tongues or switches. A defective tongue in a facing point may easily lead to serious accident. The returns show a variation in the lengths of tongue between 3ft. 6in. and 9ft. 6in. The tendency is clearly to go in for longer points and tongues than in the past. There can be no question that it is advisable to have the tongues at least 6in. longer than the length of the single-truck car wheel-base, to avoid the leading wheel throwing the tongue over before the rear wheel has entered. Other obvious benefits are derived from a long tongue, especially if curved on the branch-off side.

There is considerable diversity of opinion as to whether tongues should be placed on the inside or outside of curves, and as to the advantage of having two movable tongues instead of one tongue and a mate or dumb point. Also, on some systems, no tongue is used on trailing points. The writer hopes to hear these points fully discussed at this meeting.

The replies to question 23 regarding the "kicking" or rising vertically of the tongues of trailing points are of great interest to Glasgow, as this trouble has been considerable on this system. The great majority have had no such experience. Twelve towns — three in America—had the same trouble to a more or less extent. Without wishing in any way to disturb the piece of mind of those who have recently adopted electric traction, the writer notes that in all places where this action has developed electric traction has been in use for a considerable time, and a large proportion of those towns reporting no trouble with trailing points have had only a short

Digitized by Google

experience of the wear and tear of heavy electric cars. The writer has been giving attention to this matter for some time, and is satisfied that the wearing of the floor of the casting is the cause of the springing upwards of the tongue, and that the depression on the top of the tongue is caused by the consequent heavy blow which it receives on rising to meet the advancing wheel. A pin in the nose of the point tongue lessens this evil to only a limited extent.

The replies regarding the use of hardened steel renewable centre pieces are remarkably unanimous. About 30 towns, including four in America, have these in use, 20 are pronouncedly in favour, two—Montreal and New York—consider them unsatisfactory, the others have not had sufficient experience to express an opinion.

The essential feature of hardened steel renewable centres is that these can be renewed. It is certainly strange to find such perfect belief in this work as the replies disclosed, when practically the whole of the believers have had no experience of how this essential feature will work in actual practice. Carried out as directed by all the makers of this work, the results are anything but satisfactory. Great difficulty is experienced in cutting out the spelter and getting at the keys, and even when this is accomplished the centre piece itself is difficult to lift out of its bed. In some cases the whole casting has to be lifted and taken to the yard, and the renewable piece removed there.

As will be seen from the report, the replies give very little help in this matter with the exception of three from America. Two indicate the method of replacing, but only one, that from New York, gives the whole operation. It is as follows: "Melt zinc with blow lamp or torch, wedge centre in place, and pour in melted zinc, caulking well around the edges."

This is not quite such a simple matter as it seems, especially with large castings and long renewable pieces. After about a year's intermittent experiments, the writer has devised a means of melting out and renewing which will enable the work to be done in about one-fifth of the time formerly required, and effect a considerable saving in cost.

About 21 towns have in use, to a greater or less extent, special work of wholly manganese steel. In most cases the work seems to have been lately laid down, and no opinion is expressed as to its merits, but five towns approve of this material.

In the list of queries sent out, one question, No. 27, was, I am afraid, not quite clearly stated, and has in some instances been misunderstood. The information sought for in this question was as to the effect of special work constructed wholly of manganese steel throughout (as distinguished from manganese steel renewable pieces) in wearing down or cutting away the flanges of steel-tyred or other wheels. One or two replies to this question have been received from towns, which state that they have no special work wholly of manganese steel. Deducting all doubtful replies, the experience of four towns has been that there is considerable wear and chipping with this class of work. As a very considerable number of towns have put down this type of special work recently, this seems a point which it would be of considerable value to the association to have a report further on.

In laying new track where a new concrete bed is required, the replies show that engineers are divided almost exactly between two methods. The one section lay the concrete bed first. The rails are then laid down, lined, and packed with fine concrete. The other section lay the rails first, setting them up to line and level on blocks. The concrete bed is then put in below the rails and levelled up tightly under the flange. In several cases the adherents of each system state that they purpose to adopt the other system in future. The balance of converts is slightly in favour of the method of laying the rails first and levelling the concrete bed up to them.

Wooden sleepers are used only to a limited extent in this country, but largely in America and on the Continent. The claims put forward on behalf of this construction are easier traction, more elasticity, easier riding of cars, acts as an anchor for rail, keeps track to gauge, and lessens the noise. Toronto has used them under the old work, and is of the opinion that cross sleepers are of no advantage.

The dimensions of the sleeper vary on different systems, but the general practice seems to be about 7ft. by 8in. by 6in. Naturally, the timber used differs in different countries and localities. In this country Baltic redwood is the most usual, and this is creosoted in every case. Two replies from the Continent state that oak is used untreated. Oak chestnut, long leaf yellow pine, and cedar are used in America, and in the majority of cases are not treated. The general practice is to place the sleepers between 2ft. to 3ft. apart. In Leeds, however, eight sleepers are put in under each 60ft. length, the ones at the joints being 1ft. 8in. apart, and the others about 9ft. 8in. apart. The rails are usually fixed down to the sleepers by spikes, but in Leeds ¾in. bolts with fang washers and clips are used.

The majority of the systems reporting pave the tracks with granite setts, wood being the next in favour, and then basaltic setts. It is unfortunate that only in very few cases is the class of wood used specified. The general experience with wood paving seems favourable with light traffic, but of doubtful efficiency in city streets, especially alongside the rails. From a limited experience of wood paving in Glasgow, the writer is of opinion that the nature of the grouting of the joints has a considerable influence on the success or failure of wood paving, provided, of course, that the wood itself is satisfactory. The experience of those with large areas of wood paving would be of value to the association, especially in view of the present crusade against "noisy streets."

In about a dozen towns widening of the gauges has resulted from the expansion of the wood paving.

The testimony against the use of asphalt between and alongside the rails is very strong. In most cases a toothing of stones or wood is laid alongside the rails, but even with this protection the asphalt has in most cases proved unsatisfactory except under very light traffic.

Many towns experience trouble from the paving setts or blocks rising alongside the rails. This has been assigned to several causes, as water getting down under the setts and rails the bitumen grouting in hot weather forcing the setts up, the setts resting on the rail flange, action of heavy traffic, etc. Probably each of these has at different times been a factor in raising the paving. The writer considers it certain that in almost every case where this evil of rising paving has been met with, it will be found that the rail is not lying soundly on its bed and is springing with the traffic. A small movement in the rail will raise the setts butting against it very considerably. Each time the rail rises it takes up the paving sett, and when it goes down again it leaves the sett up, allowing sand and dirt to drop in beneath, and this taking place time after time packs the sett up. In wet weather this takes place much more quickly owing to the water below the rails and paving.

The following are some of the remedies suggested in the replies: anchor joints, holding-down bolts, use mastic packing to prevent the rail springing, use well-tarred chippings laid on bottom flange to keep out water.

"Rutting" of the paving by heavy traffic seeking the rails is a source of expense in towns. About a dozen systems use cast-iron blocks chilled on the surface and laid alongside the rails to mitigate this wear. In Glasgow we have found them of very considerable value where the weight of individual vehicles is not excessive.

By far the greater number of towns use bitumen and oil for grouting the paving joints, some using this for part of the joint and cement and sand for the remainder.

The construction of the duct or cable track is a matter of great importance and interest, and more information on this subject would have been of value. Earthenware ducts or pipes are used on 65 per cent. of the systems reported on. Almost all these lay the ducts solid in concrete; 13 per cent. of the replies state that the cables are laid in earthenware or wooden troughs, and run solid with bitumen, while the cement-lined iron duct laid in groups in concrete claims 9 per cent. in its favour. The remainder are in pipes presumably of cast iron. Note may

Digitized by Google

be taken of the method in Zürich, where the earthenware ducts are laid in sand, and Zürich where the lead cables armoured with iron strips lie in the earth without any special duct. It is a matter of regret that the position in the roadway of the duct track was not stated, also the cost per yard and the depth at which the ducts are laid.

The spacing of manholes varies remarkably on different system. The shortest distance apart recorded is 30 lineal yards, and the maximum 300 lineal yards. The average distance is about 100 yards. Only three systems go beyond 150 lineal yards. All these distances are, of course, on the straight; on corners the distance apart must vary with the radius of the curve.

The replies show that in no case has any chemical action on the cables from the material of the duct track been found. In view of sinister rumours which probably most of you have heard, this is a reassuring return. The replies giving the methods of bonding were, unfortunately, not detailed enough to be of much value. The general result shows that by far the greater number of lines are bonded with solid or flexible Chicago or Neptune bonds. Plastic bonds claim one-sixth of the whole returns. It is greatly to be desired that the general practice as to the number and weight of bonds at each joint will be brought out in the discussion.

Cross-bonding of the track is almost universal. The usual distance apart of the bonds is 40 lineal yards, but seven systems place these as far apart as 80 yards, which is the maximum distance recorded. In only four cases has any trouble been experienced from bonds working loose. The method of bonding up the special work is on almost all tramways the same as that adopted on straight track with the addition of long bonds round the castings. Dublin varies its practice by bonding ordinary work into the web, and special work into the flange. Toronto, Canada, bridges the whole special work with cables. In Glasgow we are now adopting this system, and about a month ago applied it to a large and intricate three-way junction with a very considerable saving in time and cost.

We in Glasgow have had a considerable number of the horseshoe bonds in the flange of the rail cut by the working of the paving stones under heavy traffic. Practically all the replies stated that this had not been experienced. Five towns—two in Britain and three in America—had found the same trouble. The very exceptionally heavy vehicular traffic in Glasgow is the chief cause of the evil.

The returns of the cost per mile of single track are interesting, but not of much practical value without full particulars in each case. The cost is greatly affected by so many different conditions, as the nature of the paving, the road bed, whether in the central districts of a town or suburban, the facilities allowed for opening up the roads, and many other contingencies.

The average cost of 4ft. 8½in. track per mile of single line seems to be between £5,500 and £6,000.

Regarding the actual construction of the lines, one half of the systems reporting do the work themselves and the other half by contract—a few adopt both methods.

On very few systems does it seem possible to estimate the wear due to electric traction. In almost every town with tramways in the streets the vehicular traffic takes advantage of the easier traction on the rails to as large an extent as possible. This is bound to cause considerable wear, the extent of which it is difficult to arrive at. Figures for the wear due to both electric traction and vehicular traffic are of value only at the place where they are taken, unless particulars of the class, speed, and frequency of the vehicles are given in addition to the car service. One reply states that a rail, after having been in position for 5¼ years and having carried 185,000 cars, showed $\frac{1}{16}$in. of wear. But we do not know the quantity or class of vehicular traffic over this rail. The general opinion appears to be that the wear from vehicular traffic is small compared with that from electric cars.

The writer, taking the replies of the number of men in the various permanent-way squads, endeavoured to arrive at an estimate of the average number of men per mile of track maintained, but found it was impossible to get this satisfactorily adjusted. The systems which have been longest in operation naturally have a larger proportion of men than those whose lines are recently put down. Towns with large engineering works, causing heavy vehicular traffic, have much more repair of paving than those where such wokrs are few. Each town and system must be considered by itself, in conjunction with the special conditions obtaining there.

It is also useless to attempt any summary of the annual cost per mile of track for maintenance, the replies showing in some cases a few pounds and in others many hundreds.

The general indication is that the greater part of the cost of maintenance in most towns is expended on the paving. It would be interesting to know the general practice of allocation of the cost of restoring paving which has become disturbed (as distinguished from rutted or worn) alongside the rail. This is not really a paving cost. The writer suggests that a good criterion of the actual *wear* on the paving would be the ratio of new stones used on repairs to the whole area of paving. In Glasgow "new setts" is a very large item of maintenance. Great numbers of setts, even of the hardest Scotch granite, are shattered and split the whole depth (6in.) of the sett, and are, of course, useless for redressing.

The limitations imposed on lines laid down in streets is well brought out by the return showing 21 systems on which it has been necessary to use curves of a radius of 35ft. and under. The nicety of adjustment of both wheels and track to avoid severe grinding on such a curve must be patent to everyone. In aggravation of this, one often finds that owing to the hang of the street surface the super-elevation must be put on the wrong rail.

In considering the question of curves, it is interesting to note that there is very little variation in the lengths of the single-truck car wheel bases. Very few of the returns show a wheel base outside the limits of 5ft. 6in. and 6ft.

The grades in streets where it is imperative to have a tramway are frequently very severe. One system has a grade of 1 in 8·4, while there are seven records of grades less than 1 in 10.

The returns show that 65 per cent. of the tramways sand both rails on gradients while the remainder sand one rail only.

A mechanical track cleaner is used on several systems, but its success seems doubtful. Information as to its ability to remove iron punchings, etc., jammed in the rail would be valuable, as these are very frequent in large towns.

The need of an emery rail grinder seems to be felt only on very few tramways. This is probably accounted for by the fact that the majority of the replies come from recently laid or relaid systems.

Seventeen tramways report the use of portable temporary cross-overs or shunts with electric cars without experiencing much trouble. It would be of value to know in how many of these cases bogie or double-truck cars were used.

Eight towns make provision for obviating a stoppage of the car traffic when the hose of the fire brigade is laid across the car lines. Six towns use a fire bridge which carries the cars over the hose. In three towns—Dublin, New York (Street Railway Company), and Glasgow—the bridge accompanies the emergency wagon. In Newcastle and Munich the bridge is brought by the fire brigade. In Montreal the hose is carried by slings from the span wire. Ayr gets rid of any chance of stoppage from hose across the track by duplicating the fire hydrants.

The writer is well aware of the many imperfections of this report, and would plead in extenuation the shortness of time permitted to him for the consideration of so many voluminous and valuable replies.

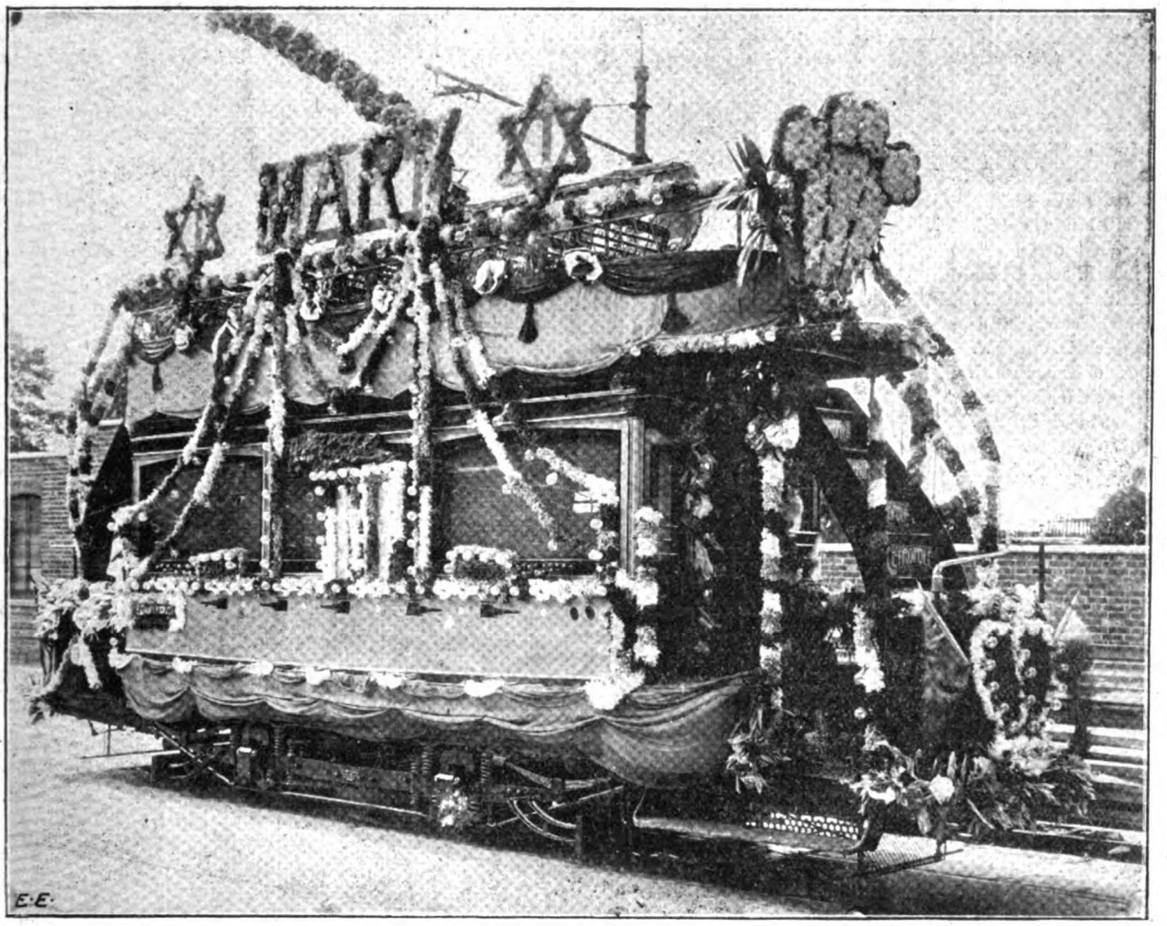
TRADE NOTICES AND NOVELTIES.

Illuminated Electric Car.

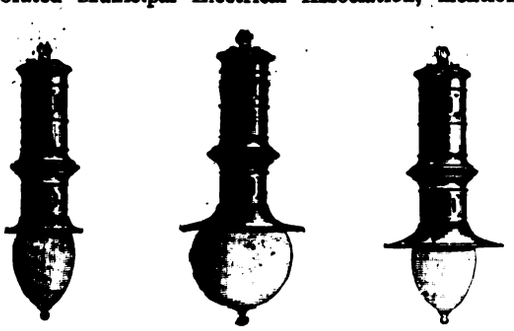
In honour of the visit of the Prince and Princess to Devonport, Mr. J. W. Endean, general manager of the Devonport and District Tramway, provided what was considered one of the finest electric displays seen in the West. It took the form of an electric illuminated and decorated car, which, as seen in the accompanying illustration, represented the battleship "King Edward VII." under steam, the ship being wholly outlined in electric lights, and surmounting the masts on either side were outlined



the Christian names of T.R.H.—viz., "George" and "May"—flanked on either side by a huge star. The canopy at each end was surmounted by the Prince of Wales's feathers, resting on a cushion of flowers, flanked with palms, while the dash of the car was covered with a large crown, flanked by the Royal standard, and resting on a cushion of flowers, the whole being outlined in electric lights from the trolley wheel to the truck. The car ran over the whole of the different routes, and at various points crowds of spectators assembled to see it pass. Mr. Endean purposes giving another exhibition of this battleship car on Thursday evening after the launch of the "King Edward VII." Mr. Endean has since received information from their Royal Highnesses the Prince and Princess of Wales that a photograph of the decorated and illuminated car would be acceptable to them.

Miniature Arc Lamps.

In the recent paper by Mr. W. A. Chamen read before the Incorporated Municipal Electrical Association, mention was



made of the improvements in small arc lamps. As an evidence of what is being done in this direction, we give herewith three illustrations of small arc lamps now being supplied by the Union Electric Company, Limited, of 151, Queen Victoria-street, London, E.C. The lamp itself is very small, being 15in. over all in length, and from 3½in. to 5in. in diameter, according to whether it is used with a pear-shaped globe and single enclosed arc, or a round globe and double enclosed arc. The lamp burns with 1½, 2, and 2½ amperes, and may be burnt in single parallel on a circuit of 100 to 115 volts, or two in series on 200 and 230 volts. The candle-power of the lamp is 160 with the smaller current and up to 250 with the larger current, this candle-power being the mean hemispherical. The makers claim that in simplicity, small number of working parts, and ease in trimming, these small lamps leave nothing to be desired. Owing to the constancy of illumination and good efficiency, they look to these lamps to replace the larger sizes of incandescent lamps. For private house work they can be supplied with silk shades to harmonise with the decorations, but the lamps will have a larger field in the industrial world.

PERSONAL.

The Tramway Committee of Walsall Town Council have decided to recommend the appointment of Mr. R. L. Horsfield, chief assistant in the tramways department of the Bradford Corporation, as tramways manager for Walsall Corporation, at a commencing salary of £200 per annum, to be increased to £250 per annum.

Mr. G. W. Spencer Hawes, M.I.E.E., of Westminster, has been elected a director of the Harrow Electric Light and Power Company, Limited.

The appointment of Mr. R. A. Chattock, at present electrical engineer to the Bradford Corporation, to the post of electrical engineer for the city of Birmingham, at a salary of £1,000 per annum, as already noted by us, has been confirmed.

The annual dinner in connection with the Croydon electricity works was held at the Café Royal on Friday, the 31st ult., and the opportunity was taken to present Mr. Scott, the chief engineer, with a case of cutlery and plate on the occasion of his approaching marriage. The presentation was made by the chairman of the Electricity and Lighting Committee, Mr. Alderman Miller, on behalf of the staff and employés. In making the presentation he referred to the good work accomplished by Mr. Scott during his period of office, and also to the able and hearty co-operation of the staff. Mr. Scott in his reply endorsed the remarks of the chairman with regard to the work of the staff. A lengthy programme of vocal and instrumental music was carried on to a late hour by the various members of the staff and friends. At the last meeting of the Electricity and Lighting Committee Mr. Scott was presented by Mr. Alderman Miller, on behalf of the committee, with a handsome marble and bronze clock.

THE WEST HAM AWARD.

Elsewhere in this issue will be found the full text of an award recently given by the Hon. Alfred Lyttleton, M.P., as arbitrator for the Board of Trade between the West Ham Corporation and the West Ham Gas Company. The importance of this award to the tramway industry as a whole cannot be over-rated, especially as it is the reverse to that given by another arbitrator on a somewhat similar issue. We refer to the Ilford case, on which a leader appeared in our issue of Jan. 23, 1903. In that case the arbitrator's award, which was confirmed in the Court of Appeal, forced the Ilford Corporation to remove and relay a gas-main which would have been covered by the concrete foundation of the tramway. We concluded that leader by the following sentence: "The decision as it stands practically enables gas and water companies to demand a new system of supply pipes from any tramway promoter who has to place a track over one old pipe; and this is carrying the principles guarding vested interests in this country to a point which heavily handicaps any improved means of locomotion." The West Ham Gas Company were not slow to take advantage of the Ilford award. When the Corporation commenced to put down tramways, the gas company demanded not only that all pipes which would be under the track should be moved, but also that duplicate gas-mains should be laid on either side of the road in order to avoid the frequent crossing under the track of service pipes. They claimed all this under Section 30 of the Tramways Act. The consulting engineer to the Corporation (Mr J. E. Waller, of Messrs. Kincaid, Waller, Manville, and Dawson) advised the Corporation to dispute the gas company's reading of the clause in question. This time the Board of Trade appointed as arbitrator the Hon. Alfred Lyttleton, who is naturally more competent to decide as to the correct interpretation of the Act than an engineer would be. The result quite justifies Mr. Waller's advice, as the gas company have lost their case and have to pay the cost of the reference and of the award. It will be seen from the full text of the award that the arbitrator considers Section 32 of the Tramways Act settles the point at issue. This section provides that nothing in the Act shall "take away or abridge any power to open or break up any road along or across which any tramway is laid or any other power vested in any local authority or road authority for any of the purposes for which such authority is respectively constituted." The clause goes on to give the requisite protection to companies supplying gas or water. The fairness of the award will be appreciated if the matter is looked at from an independent standpoint of the Corporation as the road authority. Thus, if the West Ham Corporation were to pave all their streets which may now be macadamised with granite or wood, they would use a concrete foundation, which would obstruct access to the gas company's mains. As the road authority, they have a perfect right to do this, and the gas company would have no redress whatever. If, on the other hand, they lay a tramway down, which would obstruct access to the pipes to a smaller degree, as the concrete foundation is confined to the centre of the road, the gas company claim to have new mains laid down for them in duplicate, which is obviously interfering with the vested powers which are guarded under the Tramways Act. We congratulate the West Ham Corporation and their engineers on having secured a decision of the above importance, and trust that it will remind gas and water companies that they cannot share the advantage of progress without contributing to a small extent to the extra cost involved. Tramways properly laid down and run involve enormous increases in the demand for gas and water, as they develop

Digitized by Google

land which would not otherwise be built upon. That such tramways may involve the gas and water companies in slight extra cost in making services is obvious, but the inconvenience is mutual. It must also be remembered that in no case do these users of the subsoil under our streets pay for the rights they enjoy.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

SECRECY OF MESSAGES IN WIRELESS TELEGRAPHY.

SIR,—I have just noticed an article on recent progress of wireless telegraphy in the *Electrical World* of New York of June 20. In the illustration (Fig. 3) of this article a patented arrangement of Mr. Lee de Forest is illustrated, which has for its object the limiting of the space over which waves are transmitted. It consists, briefly, of an earthed metallic screen partially surrounding the vertical wire. I do not wish in any way to detract from the credit of Mr. Lee de Forest, who has proved his energy in carrying out so much good work in the domain of wireless telegraphy; I only desire to put on record my evidence which goes to show that this invention is very similar to my own. Without wishing to mention patents and publications, I only call your attention to the article contributed by Lieutenant Poncelet and myself in the *Electrical Engineer* of July 12 and 19, 1900, in which are described successful trials for the limitation of the space over which the waves are transmitted by means of a metallic net connected to earth. Since then I continued experiments for two years, using as a receiver the common telephone, without coherers or other accessories. This receiver has the advantage of giving quantitative indications—that is to say, it enables one to estimate the intensity of the field. These trials, made with earthed screens and antennæ of variable height, have shown that with this arrangement it is possible to limit the space and direction over which waves are received or dispatched. However, this arrangement has the great disadvantage of diminishing considerably the energy of the transmission. This is explained by the fact that the screen counteracts the action of the aerial wire. I have made several successful experiments both in open country and in woods, one of which gave some curious results. Whilst working in a pine forest I observed that when the weather was dry the wood was almost transparent to the waves, and they could be received without trouble. Second, when it rained, the wood behaved as a kind of screen and stopped the transmission. Third, if one then placed the transmitters outside the wood and the receiver in the wood, the transmission could not be carried on; while if the receiver was outside the wood the messages could be sent without difficulty. This is in accord with some observations recently made by Captain Terrie, in which rain generally diminished to a considerable extent the distance to which transmission was possible. I will conclude by saying that after a great deal of research, and, in spite of the statement of Mr. Nevil Maskelyne to the contrary, the absolute secrecy of dispatches by wireless telegraphy is possible if one takes certain precautions and does not require to signal over very great distances.—Thanking you for the use of your column, yours, etc., EMILE GUARINI.

MAGNETIC SURFACE-CONTACT SYSTEMS.

SIR,—The *Electrical Engineer's* issue dated May 24 contained a report, which we have only recently noticed, on the magnetic surface-contact system. These, and chiefly the Diatto system, are criticised by Mr. G. Paul in the same manner as he has already done in the French papers.

We have already answered once, but other more recent articles by the same author have convinced us that to endeavour to make Mr. Paul understand the Diatto system would mean a great loss of time. We can only apply to this gentleman the proverb, "*There are none so deaf as those who will not hear.*" We did not wish to enter into any discussion, but we should like to state the following facts:

1. The town of Tours has employed the Diatto system since May, 1898. At present extensions of some of the suburban lines are being completed. After five years of satisfactory working, the City Council of Tours specifies the Diatto system wherever trolley lines are objectionable.

2. The Diatto system has been erected on all the lines of Lorient since January, 1900.

3. The operation of the Diatto system has not been discontinued in Paris. Temporary trolley lines have been erected in one of the main streets in view of allowing greater facilities for the construction of the Metropolitan Underground Railway.

The occasional failures which happened in Paris were caused by badly-built tracks and by the very poor method of erecting the Diatto system on the roadway and on the cars. Most of the electric tramway lines were built in a great hurry, so that they might be completed for the Paris Exhibition in 1900, and it is therefore not to be wondered at if the erecting was rather faulty, even though we had to supervise this part of the work. But then, again, lack of time prevented any kind of supervision.

We also wish to state that the Diatto system has never caused any injury to pedestrians, either in Paris, Tours, or Lorient. These are facts

The city councils of the above towns—and especially that of Tours—would confirm the truthfulness of our statements.—Yours, etc., THE DIATTO COMPANY.

13, Rue Grolée, Lyons, France.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

607. What is the best way to doctor small accumulators for electric ignition which have been over-discharged and become badly sulphated?—A. J. R.

608. An engine I have charge of is constantly breaking one or the other of the cross-head bolts. Can this be remedied? The cross-head has a double guide similar to the marine type. When the keep is screwed up tight there is about ¼in. clearance between cross-head and keep. After working a few days the bolts get loose and then break.—C. B.

ANSWERS.

Question No. 599.—Describe the electrical equipment necessary for a large 500-volt electric crane to lift, say, 50 tons, preferably a travelling crane, with special reference to the method of starting and controlling.

Answer to No. 599 (*awarded* 10*s.*).—The most advanced practice in overhead travellers is to use a separate reversing motor for each motion. In the case of a large 50-ton crane, it would be generally advisable to have two separate hoisting motors—one for raising the heavy loads at a slow speed and the other for quickly dealing with light loads. The following particulars will give an idea of the size of motors, etc., required for a 50-ton crane. A 50-ton crane recently installed was fitted with four series-wound motors. Main hoisting motor lifts 50 tons at the rate of 4ft. per minute, and takes 25 e.h.p. under full load; auxiliary hoisting motor lifts up to five tons at the rate of 15ft. per minute, and takes 12 e.h.p.; travelling motor takes 5 e.h.p., crane travelling 80ft. per minute. It is good practice to

Digitized by Google

fix this motor in the centre of the bridge, so that each end starts at exactly the same instant. If the motor is fixed at one end, and the gearing is not carefully looked after, that end has a tendency to start first, and slightly twist the crane on the rails, causing an excessive starting current. Cross-traverse motor takes 7 e.h.p., and causes the crab to travel across the bridge at the rate of 40ft. per minute. The total electrical horse-power required at full load is 49. Having these particulars, the sizes of the cables and switches, etc, required can be worked out.

Both hoisting drums should be controlled by electric brakes (see Fig. 1). The electromagnets should be wound with copper tape of sufficient section to carry maximum current taken by the hoisting motors. The magnets are

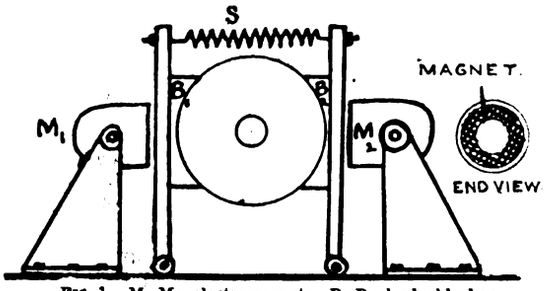

FIG. 1.—M_1 M_2, electromagnets; B_1 B_2, brake blocks; S, spring acting against magnets.

connected in series with the motors. Should the current fail from any cause the brake goes on immediately, and prevents the load falling. When the crane is set to lift or lower, the current taken by the motor passes through the magnets, and these pull the brake off immediately. If the load being lowered drives the motor too rapidly, the back E.M.F. of the motor reduces the current flowing in the circuit, and the brake goes on sufficiently to retard the speed. Fig. 2 is a sketch of the connections of a three-motor crane.

The usual practice in England is to operate the crane from a case suspended from one end of the crane girders where the man stands, switching the motors on or reversing them according to the signals he receives. Liquid starting

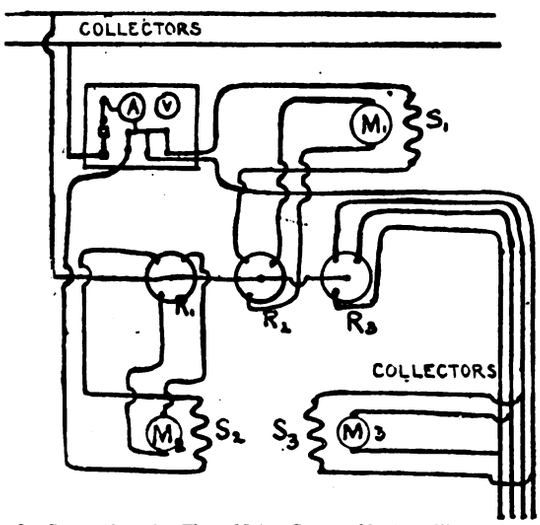

FIG. 2.—Connections for Three-Motor Crane. M_1, travelling motor; M_2, cross traverse motor; M_3, hoisting motor; S_1 S_2 S_3, series windings of motors; R_1 R_2 R_3, starting and reversing switches.

and reversing switches are very generally used. The objections to these are that the heat generated by the resistance causes the liquid (usually a solution of soda) to boil up and produces short-circuiting. Also the liquid gradually evaporates, making the solution stronger, and thus in starting up a greater strain is thrown on the motors.

On the Continent wire resistances (Fig. 3) are largely used for crane work, both for starting and regulating the speed of the motors, and a special feature is that nearly all the cranes are controlled from the ground. The frame carrying the resistance coils and switches is fixed to the centre of the crane girders, and chains hang down from the switches with labels attached to the handles to guide the person working the crane. With the wire resistances and a large number of contact points on the switch a wide range of control is obtained. The voltage mentioned is high for crane work, and special attention would have to

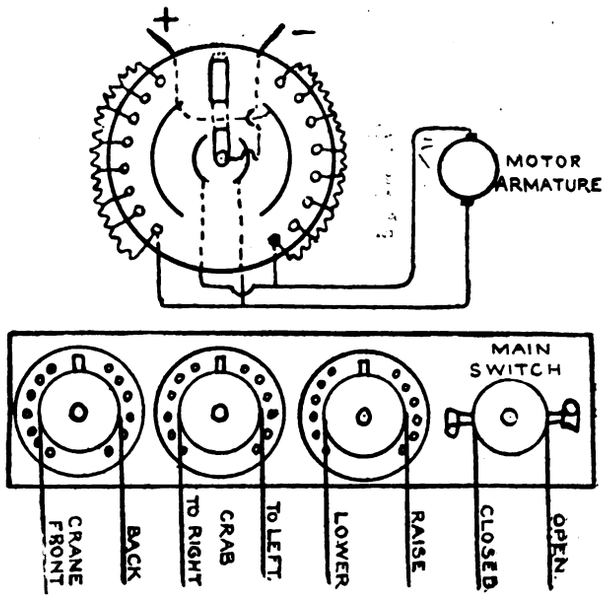

FIG. 3.—Details of Connections for starting and reversing switch.

be paid to the switches to avoid destructive sparking and also to the insulation. For collecting the current from the line and also for the hoisting motor, either trolley wheels could be used or a collector, as shown in Fig. 4, having a bearing surface of carbon, which allows copper conductor

FIG. 4.

to make excellent contact and has given much satisfaction in practice.—W. A. T.

Answer to No. 599 (*awarded* 10*s*).—The following is a description of a 50-ton 500-volt overhead travelling crane actually in use. The electrical equipment consists of three series-wound motors—one 10-h.p. for hoisting, one 5-h.p. for travelling, and one 5-h.p. for traversing. Each motor is controlled separately by the operator, who sits in a cage fixed at one end of the crane. The controllers are similar to an ordinary tramcar controller, but with the series notches only. A double-pole switch is also fixed in a convenient position in the cage within easy handling distance of the operator, for should anything go wrong with one of the controllers—suppose, say, that he could not switch the current off through a controller jamming—he could easily pull the main switch and thus avert an accident. A pair of trolley wires, + and −, are run the whole length of the engine-house. Fig. 1 shows the arrangement for fixing the trolley wire at each end. I is an insulator to which the trolley wire is fastened. B is a bracket fixed in a convenient position on the gantry along which the crane runs; the tension on the trolley wire can be adjusted by means of the nuts, $N N_1$. The trolley wires rest on insulators carried by brackets, spaced at suitable distances, along the whole length of the engine-house. These wires are fed by mains from some convenient source of current, and sweated on at one end. The current is taken from the trolley wires by means of a pair of shoes fixed to, but insulated from, the frame of the crane, and leads are taken from these shoes to the double-pole switch in the operator's cage.

As soon as the operator switches off the current, the crane motors are stopped by means of an electromagnetic friction brake. A sketch of this brake is shown in Fig. 2; from this its action will be easily understood. P is a pulley keyed on to the armature shaft. The parts shown shaded are wood blocks fixed to iron levers, L, which are pivoted at X. These levers form the armatures of the two electromagnets, I. G is a strong spring which, when no current is passing, holds the wood blocks tight on to the pulley, and thus brakes the motor. The electromagnets, I, are fixed on to, but magnetically insulated from, the cast-iron

Digitized by Google

frame, F. The coils, C C, are in series with the motor armature. As soon as the current is switched on, the electromagnets, I I, draw away the levers, L L, thus releasing the pulley and allowing the armature to turn.

Fig. 3 is a diagram of connections from which the controlling arrangements will be easily seen. T and T_1 are the trolley wires running along the side of the engine-house; M is the double-pole main switch and fuse; C is a controller, only one out of the three being shown in the figure to economise space. C_1, C_2, etc, are bare copper

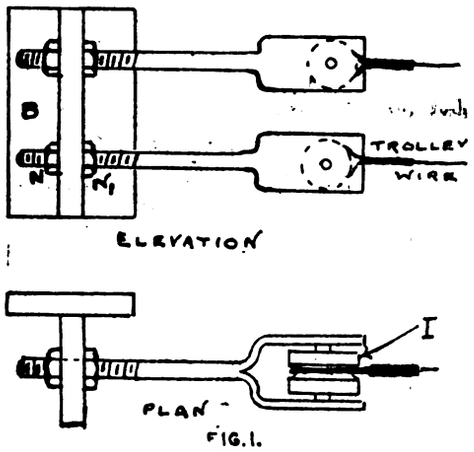

FIG. 1.

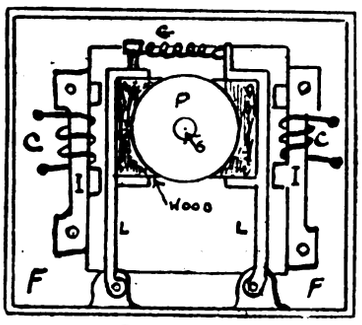

FIG. 2.

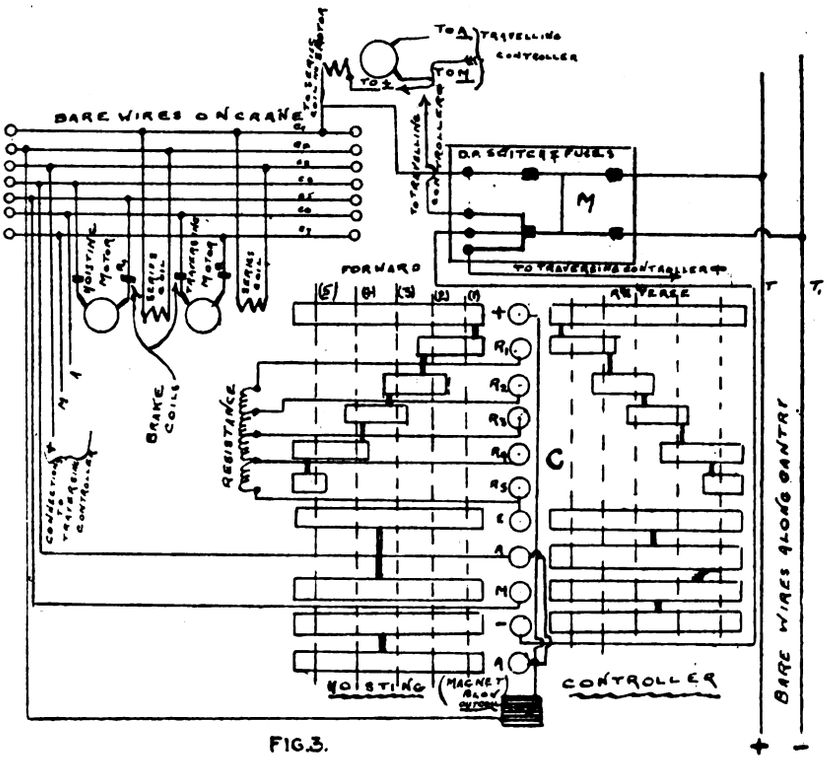

FIG. 3.

wires fixed on to insulators on the sides of the crane, enclosing the space where the ropes for hoisting and traversing pass. Current is taken from these wires by means of metal shoes, similar to those which take the current from the main trolley wires already referred to. Sliding contacts are here, of course, necessary, as the hoisting gear has to move from one end of the crane to the other. R R are the brake coils, and are in series with the armature of each motor. The letters A M refer to leads which go to similar terminals on the traversing and travelling controllers respectively. In conclusion, this crane has been in constant use for nearly two years without giving the slightest trouble.—C. N. V.

Answer to No. 599 (*awarded* 10*s.*).—One of the finest examples of electric travelling crane construction in this country is to be found in the Pinkston power station of the Glasgow Corporation tramways. In the main engine-house there are two travelling cranes, each of 50 tons capacity, while in the condensing-room there is another of 30 tons capacity, all being worked off the 500-volt circuit. These cranes were built by the Clayton Engineering and Electrical Construction Company, Limited, of Hyde, near Manchester, the leading particulars being given in the following table:

TABLE I.

	50 tons	30 tons.
Centres of runway rails	73ft. 0in.	38ft. 6in.
Centres of girders	11ft. 5in.	8ft. 10in.
Centres of cross-traverse runners	9ft. 10in.	8ft. 1in.
Longitudinal travelling speed in feet per minute	80ft.	100ft.
Cross-traverse speed in feet per minute	80ft.	100ft.
Hoisting speed in feet per minute	8ft.	10ft.
Hoisting motor	50 h.p., 350 r.p.m.	30 h.p., 475 r.p.m.
Motor for longitudinal travelling	25 h.p., 400 r.p.m.	15 h.p., 400 r.p.m.
Motor for cross-traverse travelling	25 h.p., 350 r.p.m.	15 h.p., 400 r.p.m.
Diameter of hoisting barrel	2ft. 11in.	2ft. 0½in.
Diameter of longitudinal runners	2ft. 9in.	1ft. 10in.
Diameter of cross-traverse runners	1ft. 6in.	1ft. 2in.
Head room required from top of rail	10ft. 2in.	6ft. 5in.

The hoisting and cross-traverse motors are contained in the crab, the necessary speed reduction being obtained by spur gearing. The longitudinal travelling motor is mounted alongside one of the main girders at the middle of the crane, and drives a cross-shaft through spur gearing. This shaft runs the whole length of the crane, and has at its ends pinions, by means of which the longitudinal runners are driven. The controlling switches and resistances are contained in a cage slung from one end of the crane, and from this point all the motions of the crane can be controlled. The controllers are of the standard type, being similar in appearance to those used for traction work, and the resistances are also of the traction type. The motors are totally enclosed, the horse-power being given in the above table. The hoisting and cross-traverse motors receive their current from two sets of trolley wires running the whole length of the crane and two trolleys on the crab. An automatic magnetic brake, similar to the standard type used for crane work, is supplied to the hoisting gear. It may be mentioned that these cranes, before being thoroughly finished off, lifted over 3,000 tons of material when the 5,000-h.p. main engines and generators were being erected at the before-mentioned power station.

Some very good examples of 50-ton travelling cranes are due to Messrs. Joseph Adamson, of Hyde, Cheshire, and Messrs. Vaughan and Son, of Manchester. An example of the former firm's construction is to be found in the steelfoundry of Messrs. Charles Cammel, of Sheffield. This crane is of 50 tons capacity, with a span of 62ft. The motor for longitudinal travelling is fixed in the centre of the crane at the side of one of the girders. This motor drives a cross-shaft, which drives the longitudinal runners. The speed for longitudinal travelling is 60ft. per minute, while that for cross-traversing is 40ft. per minute, and the full load is hoisted at 3ft. per minute. The various motions are controlled from a cage slung at one end of the crane, metallic resistances being used. The hoisting motor is fitted with an automatic brake applied to a brake pulley on the motor spindle. When the current is off, the brake blocks are kept in contact with the brake pulley by means of springs in duplicate. An electromagnet draws these blocks off as soon as the current is switched on.

Digitized by Google

It may be of interest to give two examples of travelling cranes operated by polyphase current, to enable a comparison to be made with those given in Table I. In Table II. are given the leading particulars of a 40-ton and a 25-ton travelling crane. The former is operated by three-phase and the latter by two-phase current:

TABLE II.

	40-ton.	25-ton.
Centres of runway rails	62ft. 4in.	71ft. 3in.
Centres of cross-traverse runners	6ft.	5ft.
Longitudinal travelling speed in feet per minute.....	130ft.	100ft.
Cross-traverse speed in feet per minute.....	66ft.	100ft.
Hoisting speed in feet per minute	6ft.	{ 0-10 tons, 3ft. 10-25 tons, 12ft.
Hoisting motor	25 h.p., 550 volt	6 h.p., 730 r.p.m.
Motor for longitudinal travelling	25 h.p., 550 volt	9½ h.p., 730 r.p.m.
Motor for cross-traverse travelling	10 h.p., 550 volt	3 h.p., 730 r.p.m.
Diameter of hoisting barrel...	2ft. 5½in.	1ft. 4¾in.
Diameter of longitudinal runners	3ft.	2ft. 1in.
Diameter of cross-traverse runners	1ft. 6½in.	1ft. 4in.
Head room required from top of rail	14ft.	9ft. 3in.

The 40-ton crane is one spanning the foundry in the Vulcan Shipyard at Stettin, the crane being built by the Stückenholz Company and equipped by the Allgemeine Elektricitäts-Gesellschaft, Berlin. The motors are of the latter firm's standard three-phase type, and work at 550 volts, 50 periods. The hoisting and cross-traversing motors are mounted on the crab, while the motor for longitudinal travelling is mounted at the side of one of the girders at the centre of the crane, driving the runners by means of a cross-shaft and spur gearing. All the motors have the rotors provided with slip-rings and liquid resistances; the starting, reversing, and controlling switches being contained in a cage slung from one end of the crane. The hoisting motor works through worm gear, and two speeds are obtainable by a double clutch. The traversing motor is provided with an electrically-worked band brake, while the travelling motor has a foot-brake.

The 25-ton crane spans the main engine-house of the Midland Electric Power Corporation at Ocker Hill, Staffordshire, and was built by Messrs. Higginbottom and Mannoch, of Manchester, the electrical equipment being supplied by the Oerlikon Company. The motors are 200 volts, 50 periods, the rotors being provided with slip-rings. The various motions are controlled from a cage slung from one end of the crane. Each motion is regulated by means of a combined reversing and resistance switch, the resistances being "star" connected. They are adjusted to give the maximum slip between no load and full load. When hoisting empty a speed variation of 15 per cent. can be obtained by the resistance, while for travelling light the speed can be varied about 40 per cent. Automatic electric brakes are fitted to all three motors.

A few words may be said about controllers and resistances. The liquid type of resistance is used by some Continental crane builders, but this type, in the writer's opinion, is entirely unsuitable for crane work. The advantages due to simplicity in connections and operations are entirely displaced by the disadvantages due to maintenance, renewals, etc. With continuous-current series motors, which are now practically "standard" for crane work, controllers which are practically the same as those used for traction purposes give the best results, and should always be employed. In order to simplify the handling of these, the controllers operating the hoisting and cross-traverse motors respectively may with advantage be connected in such a way that one handle will command both motions. The Union Electricitäts-Gesellschaft, of Berlin, and Messrs. Lahmeyer have a very neat arrangement of this kind. By a universal joint one handle operates two ratchet wheels, each of which works a pinion connected to the controller spindle. The handle in its normal "off" position is vertical; when moved forwards and downwards, it means *lowering*; when moved backwards, *lifting*; when moved to the right, *traversing to the right*; and to the left, *traversing to the left*. Lifting and traversing can proceed simultaneously by moving the handle in a diagonal direction. The resistances should be of the "traction" type to give the best results. This may be of the "grid" or "strip" variety, each kind being absolutely fireproof. The motors, too, should be of the totally enclosed type, those similar to traction motors being preferable, on account of the facilities offered by this type for inspection. Traction motors are always to be preferred on cranes which are subject to severe working conditions, as this type has been thoroughly standardised to meet the severe conditions required in traction work. By adopting this type for the motors, and the "traction" type of controllers and resistances, breakdowns will be of rare occurrence.—A. D.

Answer to No. 599 (*awarded* 5*s.*).—The crane, the electrical equipment of which is here described, is a three-motor travelling crane. All controlling apparatus is confined to a small cab, suspended from the crane, in which the driver sits. Fig. 1 is a sketch of one of the starters.

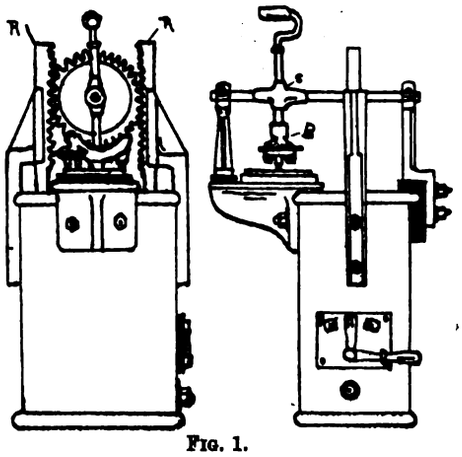

FIG. 1.

They are liquid resistances, the liquid being a solution of caustic soda, and the reversing arrangements are over each tank. Referring to the sketch, two bearings (one not shown in left-hand view) support a spindle on which is fastened a spur-wheel and a special sleeve, S. The wheel engages with two rack rods, at the bottoms of which are the wrought-iron electrodes or "dippers." The sleeve is keyed on to the shaft, but is not fastened on to the vertical handle spindle. This spindle can turn freely except for a square end at the bottom, which slides in the bridge, B. On this bridge three brass plunger contacts are secured, one connected to the bridge electrically, the other two connected together but insulated from the rest. The bridge can turn and the plungers move over contacts arranged on a slate base as shown in A, Fig. 2. Because of

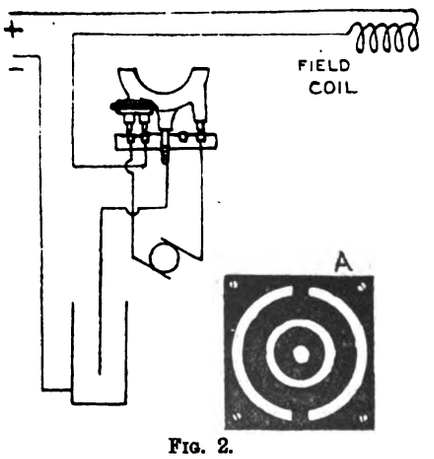

FIG. 2.

the construction of this switch the bridge can only be turned when its axis is in line with the handle spindle—that is, when the latter is vertical. Thus the contact is made on the switch before the dippers can descend; also, on breaking the circuit, the current is cut off at the surface of the liquid before the switch can be put in the "off" or "reverse" position. This arrangement is well adapted for high-voltage work, doing away, as it does,

Digitized by Google

with burnt contacts. Along the bottom of each tank is a contact bar with spring clips on. When the dippers descend they are pushed into the clips, and thus make a good connection.

The current is supplied to the crane by two single bare No. 4 gauge wires stretched the full length of the shop just below one rail and resting on wide insulators placed at intervals. When the crane comes along, these wires are picked up by brass collectors, and the current is taken to a double-pole automatic cut-out, from which it goes to each motor and starter. For the long traverse a 9-h.p motor is used, and is capable of attaining a speed of 100ft. per minute along the track with full load on. The con-

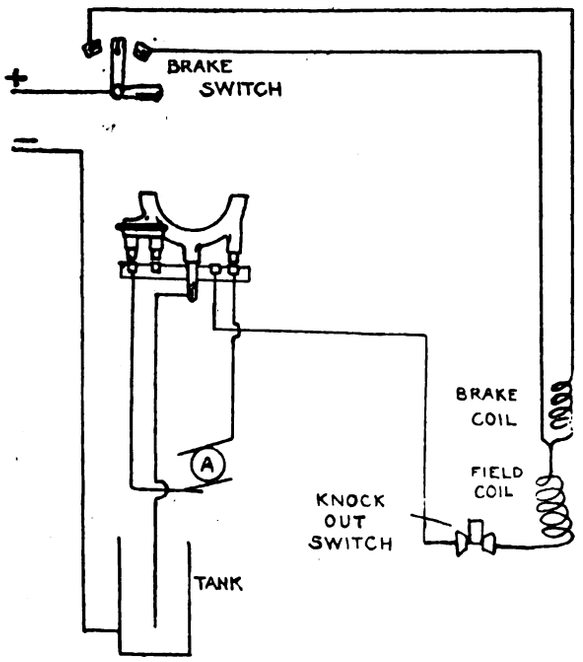

FIG. 3.

nections for this motor are given in Fig. 2. This motor, as are also the other two, is series wound. A $^{19}/_{21}$ cable comes from the main through the field coil to the inside ring of the reversing switch. From this ring the current flows through the plungers to either of the outside half rings. These semi-circular pieces are each connected to one side of the armature, and the single plunger makes the connection for armature return. As will be seen from the sketch, the connection is taken from the central spindle to the dippers, through the contact bar, and back to the negative main. The cross-traverse motor is 4 h.p., and can move the crab at a speed of 50ft. per minute. The connections for this motor are the same as in Fig. 2, but the two field and two armature leads are bare, and stretched across the crane. The crab is fitted with four collectors, to pick up the current as it moves backward and forward. Fig. 3 gives the connections for the 12-h.p. hoist motor. This motor will raise the full load at the rate of about 3ft. per minute.

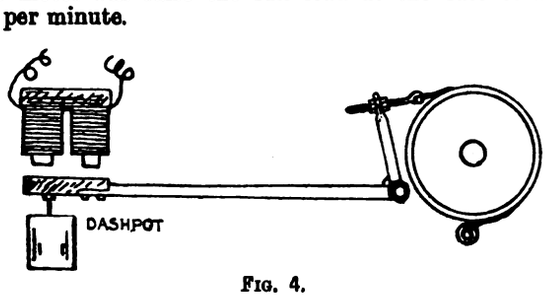

FIG. 4.

To prevent the load falling when the current is switched off, a magnetic brake is used. The current which goes through the motor excites the magnet, shown in Fig. 4, attracts the keeper, and so holds a steel strap off the grooved wheel. As soon as the current is switched off, however, the weight of the keeper applies the brake. To work with this arrangement, the brake switch, which is for convenience on the front of the hoist tank, must be on the left contact. When lowering work into a lathe, etc., it is necessary that care be taken, and so the switch is put on the right-hand side, thus leaving the brake on all the time and using power to lower. This allows of more exactness, and the brake, to prevent jerks, is fitted with a dashpot. It must be noted that five wires are needed for this motor—two for the armature, two for the field, and an extra one for the brake. These are also bare, and stretched across for collectors to work on. In order that the driver may not raise the bottom block too high, a knock-out switch is put in circuit, and is worked by gearing from the winding drum spindle, as in Fig. 5. This is so set that when the blocks get dangerously near together, a projecting stud on the larger wheel hits the lower end of the switch arm, and knocking it out, breaks the circuit.

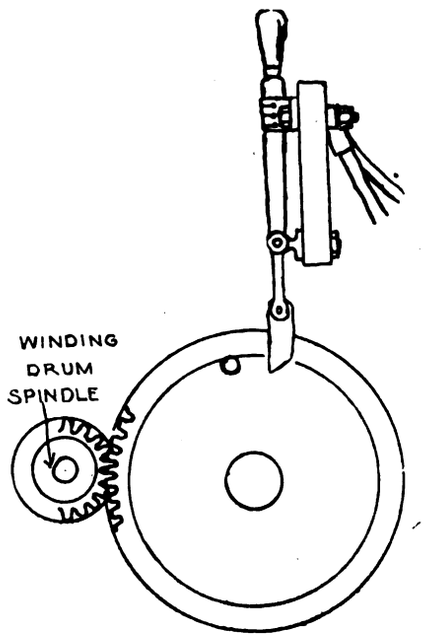

FIG. 5.

The chief danger to be on the look out for in this type of crane is the insulation of tank fittings. If they are not well looked after they soon cause trouble, due to the vapour rising from the liquid.—P. D.

Question No. 600.—Distributors run along a main road, and a consumer's residence is situated 180 to 190 yards up a side road, which is a public bridle path and footway. Is it legal to charge the consumer for the whole cost of such main, or would he come under the Board of Trade minimum charge clause of the provisional order—*i.e.*, "to pay in the aggregate for a supply of energy for three years a sum not exceeding 20 per cent. upon the cost of laying such distributor to the nearest available source of supply"?

Best Answer to No. 600 (*awarded* 10*s.*).—It would be illegal to charge the consumer mentioned by "H. F." with the whole cost of such main, yet he comes under the Board of Trade minimum charge clause. The cost of the extension comes under the following clause: "The cost of so much of any electric line for the supply of energy to any owner or occupier as may be laid upon the property of such owner or in the possession of such occupier, and of so much of any such electric lines as it may be necessary to lay for a greater distance than 60ft. from any distributing main of the undertakers, although not on such property, shall, if the undertakers so require, be defrayed by such owner or occupier." So that the consumer should be charged for so much of the cost of the extension that is a greater distance than 60ft. from the undertaker's distributing mains.

It will be seen that the cost of the extension is not paid for by the consumer under the Board of Trade minimum charge clause, yet it is directly connected with the cost of the extension, or, to speak correctly, with the capital outlay. The undertakers can compel by their provisional order, if they desire, *any* consumer to enter into an agreement to pay a sum not exceeding 20 per cent. for three years upon the cost of laying such distributor, whether it is an extension or whether the supply is taken from existing mains. The payment is meant as a security for interest, binding the consumer to pay for so much energy in advance

Digitized by Google

in return for the capital outlay. It would be quite legal for the undertakers in question to compel the consumer to pay under this clause for the 60ft. of main which has to be laid by the undertakers.

I have only heard of the minimum charge being carried into effect in one or two cases. There are one or two London companies that insert in their conditions of supply the following: "In any event the consumer undertakes to pay for a minimum charge for electricity supplied a sum of £3 per annum, and also to pay for the service line from the company's mains."—J. W. W.

Answer to No. 600 (*awarded* 5*s.*).—It would seem from the facts stated that the corporation or the undertakers supplying current are not legally bound to supply this consumer with current, as he is such a distance from the nearest distributing main. If the consumer is only likely to require a small amount of current, it would probably not pay for either the consumer or the undertakers to pay for the main in question. If there are other persons on the route that are likely to require current in the future, some arrangement might be made for each to contribute a portion of the cost of the main. Section 27 of the schedule of the Electric Lighting Clauses Act, 1899, provides that undertakers shall, upon being required to do so by the occupier of any premises situate within 50 yards from any distributing main of the undertakers in which for the time being they are required to maintain a supply of energy for the purposes of general supply to private consumers under the special order of the Board of Trade regulations, give and continue to give a supply of energy for those premises in accordance with the provisions of the special order and of the said regulations, and they shall furnish and lay any electric lines that may be necessary for the purpose of supplying the maximum power with which any such occupier is entitled to be supplied under the special order, etc. A consumer that is 180 to 190 yards away is therefore not legally required to be supplied with current. But if the undertakers desire to supply the consumer with current, and the consumer is prepared to pay his legal share of the cost of the main, then the undertakers may call upon the consumer to defray the cost of so much of any electric wire which may have to be laid on his premises, and of so much of any electric lines as it may be necessary to lay for a greater distance than 60ft. from any distributing main of the undertakers. The consumer can thus be legally charged for 160 to 170 yards of the necessary main.—W. A. T.

LONDON TRAFFIC ENQUIRY.

Members of the Royal Commission, which is enquiring into the subject of locomotion in London generally, on Friday last journeyed in motorcars through the Metropolis and several suburban districts, in order to gather a more practical knowledge of the areas over which their enquiry extends. The trip was made at the invitation of the Automobile Club, who took this novel form of offering evidence before the Commission. The districts traversed included all the more representative thoroughfares in London, and with the assistance of officials of the club the Commissioners were able to gain much valuable information which will help them in their labours. The Commission has now risen for the summer vacation, but we understand that several of the members will shortly start on a visit to the States in order to examine and enquire into the transport facilities provided in some of the chief American cities.

APPOINTMENTS VACANT.

Chief Assistant Engineer, Ipswich, salary to commence at £160 per annum. See advertisement.

Three Charge Engineers, Ipswich, salary to commence at £90 per annum. See advertisement.

Two Switchboard Attendants, Ipswich, salary to commence at £60 per annum. See advertisement.

Instructor in Mathematics, Governing Body of the Northampton Institute, Aug. 24. Advertisement in last issue.

Assistant Engineer (temporary), London County Council, £4 to £5 per week (according to qualifications), 12th inst.

Electrical and Mechanical Draughtsman, Stalybridge, knowledge of central-station work. See advertisement.

Mains Superintendent. See advertisement.

DUDLEY ELECTRICITY UNDERTAKING.

Below we give abstracts of the accounts of the above undertaking for the year ended March 31 last, the capital expenditure on which date amounted to £67,392:

REVENUE ACCOUNT.

Expenditure.	£	s.	d.
Coal	2,072	5	8
Oil, engine-room stores, etc.	534	7	11
Wages at generating station	566	12	7
Repairs and maintenance of machinery, etc.	156	13	7
Repairs and renewals of mains	5	18	8
Repairs and renewals of meters	22	5	0
Public lamps—attending, etc.	137	12	7
Rent, rates, and taxes	353	17	11
Management expenses	511	4	1

WEST HAM TRAMWAYS AND THE GAS COMPANY.

The following is the award of the Hon. Alfred Lyttleton, M.P., in the important arbitration between the West Ham Corporation and the West Ham Gas Company with regard to what extent, if any, the Corporation should be called upon to remove the gas-mains consequent on the construction of the electric tramways at West Ham:

Whereas, by the West Ham Corporation Act, 1900, the West Ham Corporation were authorised and empowered to construct and maintain the tramways therein described within the borough of West Ham, and are the promoters of such tramways within the meaning of the Tramways Act, 1870. And whereas, by Section 30 of the Tramways Act, 1870, it is enacted that for the purpose of making, forming, laying down, maintaining, repairing, or renewing any of their tramways, the promoters may from time to time where and so far as it is necessary or may appear expedient for the purpose of preventing frequent interruptions of the traffic by repairs or works in connection with the same, alter the position of any mains or pipes for the supply of gas or water, or any tube, wire, or apparatus for telegraphic or other purposes, subject to the provisions of that Act, and also subject to the following, among other restrictions, that is to say, before laying down a tramway in a road in which any mains or pipes, tubes, wires, or apparatus may be laid, the promoters shall, whether they contemplate altering the positions of any such mains or pipes, wires, or apparatus or not, give seven days' notice to the company, persons, or person, to whom such mains or pipes, wires, or apparatus may belong, or by whom they are controlled, of their intention to lay down or alter the tramway, and shall at the same time deliver a plan and section of the proposed work. And whereas if it should appear to any such company or person that the construction of the tramway as proposed would endanger any such main or pipe, tube, or apparatus, or interfere with or impede the supply of water or gas, or the telegraphic or other communication, such company or person (as the case may be) may give notice to the promoters to lower or otherwise alter the position of the said mains or pipes, tubes, wires, or apparatus in such manner as may be considered necessary, and any difference as to the necessity of any such lowering or alteration shall be settled in manner provided by that Act for the settlement of differences between the promoters and other companies or persons, and all alterations to be made under the said section shall be made with as little detriment and inconvenience to the company or person to whom such mains or pipes, or tubes, wires, or apparatus may belong, or by whom the same are controlled, or to the inhabitants of the district, as the circumstances will admit, and under the superintendence of such company or person, or of their surveyor or engineer, if they or he think fit to attend, after receiving not less than 48 hours' notice for that purpose, which notice the promoters are hereby required to give. And whereas by Section 33 of the Tramways Act, 1870, it is, amongst other things, enacted that if any difference arises between the promoters or lessees on the one hand and any gas company on the other hand with respect to any interference or control exercised or claimed to be exercised by them or on their behalf, or by the promoters or lessees by virtue of that Act in relation to any tramway or work, or in relation to any work or proceedings of the company, or with respect to the propriety of or the mode of execution of any work relating to any tramway, or on the question whether any work is such as ought reasonably to satisfy the company concerned, or with respect to any other subject or thing regulated by or comprised in that Act, the matter in difference shall (unless otherwise specially provided by that Act) be settled by an engineer or other fit person nominated as referee by the Board of Trade on the application of either party, and the expense of the reference shall be borne and paid

Digitized by Google

as the referee directs. And whereas the West Ham Gas Company (being a company within the meaning of the said Sections 30 and 33 of the Tramways Act, 1870) has caused to be served on the said Corporation of West Ham a notice, under Section 30 of the said Act, requiring the said Corporation to execute certain alterations and works, and to lower certain mains and pipes. And whereas a difference as to the necessity of such lowering or alteration has arisen between the said parties. And whereas by an agreement in writing dated the 25th day of April, 1903, expressed to be made between the said Corporation of the one part and the said gas company of the other part, reciting that the said parties had applied to the Board of Trade to nominate a fit and proper person as referee to settle such differences, and that the Board of Trade in exercise of their said powers had nominated and appointed me, the Hon. Alfred Lyttleton, K.C., as referee to settle the matters in difference between the said parties, it was agreed between the parties thereto that it be referred to me, the Hon. Alfred Lyttleton, K.C., to award and determine:

1. Whether the Corporation under the provisions of Section 30 of the Tramways Act, 1870, or any other section of the said Act, ought to be required before laying down the tramways shown on the plans delivered by them to the company as aforesaid, to execute all, or some, or any of the alterations to the mains, pipes, tubes, or apparatus of the company, in the manner the company consider necessary as hereinbefore recited.
2. Whether the Corporation under the provisions of the said section, or any other section of the Tramways Act, ought to be required as aforesaid to execute any alterations to the mains, pipes, tubes, or apparatus of the company, other than or differing from the alterations to the mains, pipes, tubes, or apparatus of the company, in the manner the company consider necessary as hereinbefore recited.

Now I, the said referee, having taken upon myself the burthen of the said reference, and having heard and weighed the evidence, and having in particular considered the provisions of Section 32* of the said Tramways Act, 1870, do make and publish my award in writing of and concerning the premises. That is to say:

I award and adjudge that the Corporation ought not to be required before laying down the tramways shown on the plans delivered by them to the company as aforesaid to execute all, or some, or any of the alterations to the mains, pipes, tubes, or apparatus of the company, in the manner the company consider necessary as hereinbefore recited. And that the said Corporation ought not to be required to execute any alterations to the mains, pipes, tubes, or apparatus of the company, other than or differing from the alterations to the mains, pipes, tubes, or apparatus of the company, in the manner the company consider necessary.

And I further award and direct that the said West Ham Gas Company do pay to the said Corporation of West Ham their costs of the reference, and the costs of this my award, and that in case the said West Ham Corporation shall pay such last-mentioned costs, I award that the West Ham Gas Company do repay to the said Corporation the amount which they shall so pay.

In witness my hand this 13th day of July, one thousand nine hundred and three.

(Signed) ALFRED LYTTLETON.

* The following are the provisions of Section 32 of the Tramways Act referred to in the award:

32. *Rights of Authorities and Companies, etc., to Open Roads.*—Nothing in this Act shall take away or abridge any power to open or break up any road along or across which any tramway is laid, or any other power vested in any local authority or road authority for any of the purposes for which such authority is respectively constituted, or in any company, body, or person for the purpose of laying down, repairing, altering, or removing any pipe for the supply of gas or water, or any tubes, wires, or apparatus for telegraphic or other purposes, but in the exercise of such power every such local authority, road authority, company, body, or person, shall be subject to the following restrictions, that is to say: (1) They shall cause as little detriment or inconvenience to the promoters and lessees as circumstances admit. (2) Before they commence any work whereby the traffic on the tramway will be interrupted they shall (except in cases of urgency, in which cases no notice shall be necessary) give to the promoters and lessees, if there be any, notice of their intention to commence such work, specifying the time at which they will begin to do so, such notice to be given 18 hours at least before the commencement of the work. (3) They shall not be liable to pay to the promoters or lessees any compensation for injury done to the tramway by the execution of such work, or for the loss of traffic occasioned thereby, or for the reasonable exercise of the powers so vested in them as aforesaid. (4) Whenever for the purpose of enabling them to execute such work the local authority or the road authority shall so require, the promoters or lessees shall either stop traffic on the tramway to which the notice shall refer, where it would otherwise interfere with such work, or shore up and secure the same at their own risk and cost during the execution of the work there: Provided that such work shall always be completed by the local authority or the road authority, as the case may be, with all reasonable expedition. (5) Any company, body, or person shall not execute such work so far as it immediately affects the tramway except under the superintendence of the promoters, unless they refuse or neglect to give such superintendence at the time specified in the notice for the commencement of the work, or discontinue the same during the progress of the work; and they shall execute such work at their own expense, and to the reasonable satisfaction of the promoters: Provided that any additional expense imposed upon them by reason of the existence of the tramway in any road or place where any such mains, pipes, tubes, wires, or apparatus shall have been laid before the construction of such tramway shall be borne by the promoters.

LEGAL INTELLIGENCE.

A BRADFORD TRAM ACCIDENT.

In the Nisi Prius Court at Bradford on Friday, before Mr. Justice Grantham, an action arising out of an accident on the Bradford electric tramway system last September was heard with a special jury. The plaintiff was Mr. Joseph Drake, a commercial traveller, and the Mayor and Corporation of Bradford were the defendants, the claim being for £2,000 as damages. A sum of £500 was paid into court.

It appeared that on Sept. 1 last the plaintiff boarded one of the Bradford cars having its terminus in the City-square. At the corner of Harris street the car, it was stated for the plaintiff, was run at full speed instead of slowing down, with the result that the trolley pole came off the overhead wire, and became entangled with the overhead ducts. This broke the wire, which fell and brought the car to a standstill. The plaintiff was sitting close to the trolley pole, and received a violent shock. The peculiar feature of the case, said Mr. Macaskie for the plaintiff, was that there was no blow or impact from the pole or wire, the injury done to the plaintiff's constitution being entirely due to shock. The plaintiff had in consequence to give up business, and had to incur considerable sums in doctors' fees and enforced holidays at the seaside.

Evidence was called both for the plaintiff and defendants, and

His Lordship, in summing up, said everything pointed to the fact that the plaintiff was affected in some extraordinary way by the electric current. If the shock was the primary cause of his illness, he was entitled to recover, even if his health at the time of the accident was not so good as it might be. It was remarkable that the defendants had themselves given practically no explanation of the cause of the accident. It was an accident, and a bad one. It was very strange that they could not help them in the matter. The only tangible cause they could suggest was excessive speed.

The jury, after 15 minutes' deliberation, returned a verdict for the plaintiff for £450.

His Lordship: That will be a verdict for the defendants, for the Corporation have already offered £500.

Mr. Waugh addressed the Court on the question of costs, and the argument was adjourned.

ELECTRIC TRAMWAYS CONSTRUCTION AND MAINTENANCE COMPANY.

Before Mr. Justice Swinfen Eady, in the Chancery Division on Friday, in the action of the National Electric Traction Company *v.* the Electric Tramways Construction and Maintenance Company, Limited, **Mr. Deane**, for the plaintiff company, applied that his Lordship would continue the appointment of a receiver of the defendant company until judgment or further order.

Mr. Ashton Cross appeared for the defendant company, and stated there was a petition by a creditor for the winding-up of the company which came before Mr. Justice Bryne, and was standing over pending an arrangement being come to by which all the creditors would be satisfied.

After some discussion, **His Lordship** continued the receiver until the trial.

COMPANIES' MEETINGS AND REPORTS.

GREAT NORTHERN AND CITY RAILWAY.

The half-yearly meeting of the shareholders in this Company was held at the Westminster Palace Hotel on Tuesday, Sir Charles Scotter presiding.

The **Chairman** said, with regard to the construction of the railway, that the main line between Moorgate-street and Drayton-park was now almost completed. The generating station and the whole of the machinery were finished and ready to begin working. In addition, the greater part of the rolling-stock had been delivered, so that matters were in a forward state in view of the time when the contractors would be able to invite the Board of Trade inspector to make his official examination of the undertaking. Considerable progress had been made with the extension from Drayton-park to Finsbury Park. There was no reason why the work should not be completed within a short period. Before the next half-yearly meeting he believed that the line between Moorgate-street and Finsbury Park would be practically open for traffic. The extension to the Bank at Lothbury—a very important part of the system—would not be completed by then, but it was not intended to delay the opening of the main line on that account. Directly the railway was finished from the City to Finsbury Park, where the station was being built under the Great Northern Company's line at that place, it would be opened for traffic, and the directors had good grounds for hoping that its opening would be attended with success. The Board looked on the Finsbury Park extension and the extension to the Bank as most important factors in connection with the success of the railway; and, although they expected a heavy traffic to Moorgate-street, they felt certain that it would be largely increased so soon as they were able to carry passengers from Finsbury Park to the Bank. He concluded by moving the adoption of the report.

The **Earl of Lauderdale** seconded, and the motion was agreed to.

An extraordinary general meeting was afterwards held for the purpose of considering resolutions with regard to the creation and issue of £450,000 additional capital in the form of preference shares or stock, and £150,000 debenture stock.

Lord Lauderdale seconded the resolutions, and they were unanimously passed.

Digitized by Google

CENTRAL LONDON RAILWAY.

On Wednesday the ordinary general meeting of the shareholders in this Company was held at the Holborn Restaurant under the presidency of Sir Henry Oakley.

The report of the directors for the half-year ended June 30 last stated that the amount expended on capital account during the half-year has been £84,373. Receipts from all sources of revenue amount to £187,235 and working expenses to £94,350, leaving a balance of £92,885 carried to the net revenue account. There is again a large increase in the amount paid for rates and taxes, the outlay under this head being now equal to 15 per cent. of the net receipts. The number of passengers carried was 23,179,138, an increase of 299,804. After providing for interest on the debenture stock and special expenses, amounting to £1,947, attending the vibration enquiry, the net revenue account shows a balance of £102,406, including £27,717 brought forward from last half year. The directors recommended a dividend on the undivided ordinary stock at the rate of 4 per cent. per annum, and on the preferred ordinary stock at the rate of 4 per cent. per annum. After putting aside £10,425 for the proportion applicable to the deferred stock—the dividend on which is not payable until the result of the year's working has been ascertained—there remains an unappropriated balance of £45,406. The Board deem it prudent to defer any appropriation of this balance. The whole of the trains on this Company's railway are now satisfactorily worked by motorcars on the multiple-unit system. It is anticipated that this new and improved service will enable the Company to give better accommodation to the public, and that, with further experience, material economy in working will result. To enable the lifts to be worked independently of the main railway electric service, a new sub-station is in course of construction at Bond-street Station. The large fan at Shepherd's Bush for the ventilation of the tunnels has been erected and tested, and will, as soon as possible, be regularly worked.

The **Chairman**, in submitting the above report, referred to the change over from locomotives to the multiple-unit system, in order to carry into effect the recommendations of the commission which enquired into the question of vibration. The Company had had 68 of these new motor-carriages at work for some time with remarkable success. By this method of working a saving had been made in the cost of coal, and there had been greater facility in the dispatch of trains at either end of the line, no time being lost, as was formerly the case, in changing engines. So far as it had been possible to test the new system, the directors thought that the discomfort complained of had been banished. There was, however, a disagreeable side to the subject. A number of engines which cost £69,000 had been thrown out of use. No doubt they were still worth something, but the difference between what they would realise and what they cost to capital would have to be paid for at some time out of revenue, so that their capital might be always represented by useful working material. A sub-station was in course of construction at Bond-street Station to enable the lifts and the lighting of the tunnels to be supplied with current, independently of the central power station. This improvement would, he considered, be appreciated by the public, as its effect would be to prevent their being left in darkness in the event of any temporary disorganisation in the main electric service. With regard to the ventilation of the line, he stated that a large fan had been erected at Shepherd's Bush, and, on the few nights on which it had been tested, it had been found possible to clear the whole of the air in the tunnels three times in one hour; and he was told by travellers that in the morning the air was remarkably fresh. He did not think that it continued quite the same throughout the day, because the presence of so many passengers rendered it warm and less pleasant than at first. However, he hoped that as time went on some means would be found for keeping the air fresh all day. The revenue account presented several satisfactory features. During the six months under review, 300,000 more passengers had been carried than in the corresponding period of 1902, when the traffic was increased, at the lowest computation, by 350,000 persons owing to the influx of visitors into London on the occasion of the peace festivities and the Coronation arrangements. During the past six months, therefore, they had, by the growth of the ordinary daily traffic, made up for the absence of the special traffic of last year, and gained an additional 300,000 passengers, making the increase upwards of 600,000. That was strong proof of the popularity of the line, and the Board had great faith in the maintenance of the present steady progress of the traffic. They now carried 2,900,000 workmen in the half-year, which was equivalent to 12½ per cent. of the total number, and as workmen were charged only half fare, the earnings per passenger amounted to 1¾d. Turning to the expenses, he pointed out that the Company had earned £2,100 extra at a decreased cost of £3,000. Unfortunately, the rates and taxes had risen by £4,301, so that the net improvement in the earnings was reduced to about £700. After a sympathetic reference to the death of Viscount Colville of Culross, one of the original members of the Board, the chairman stated that Sir Michael Hicks-Beach, M.P., had accepted an invitation to fill the vacancy.

Lord Rathmore seconded the motion, which was unanimously adopted.

METROPOLITAN RAILWAY.

The half-yearly meeting of the proprietors was held at the Cannon-street Hotel on Friday, Mr. J. J. Mellor presiding.

The **Chairman**, in moving the adoption of the report, said the contracts for the electrical installation were, for the most part, well in hand, the power-house, with the machinery, should be completed by the end of this year, and the boiler-house and boilers, steam-turbines, switchboard, electric cranes, and all the plant necessary to complete the installation were being proceeded with in a satisfactory manner. They were also pushing forward the equipment of the permanent way, and favourable contracts had been made for the conductor rails and for some corridor, motor, and trailer cars, which were now being built. The British Westinghouse Company were supplying the whole of the machinery and plant. Speaking on the general and future prospects of the line, he said he believed that the electrification would inaugurate a new era of prosperity, and that they would be able to carry on the circle no fewer than 50,000,000 passengers a year. The time was fast approaching when the line, freed from its red-hot fireboxes, purged of its sulphur and its smoke, instead of being shunned on account of its heated atmosphere, would be selected as the coolest, the sweetest, and altogether the most agreeable route in London; the coolest and freshest in summer and the warmest in winter, where neither rain or fog could penetrate.

The motion was carried unanimously.

A special meeting was afterwards held to authorise the issue of an further £300,000 of capital, the bulk of which was required for electrification and works in connection therewith. The motion was agreed to.

CROMPTON AND CO.

The annual general meeting of the shareholders in this Company was held at Salisbury House on Wednesday, Mr. J. Trotter presiding.

The report of the directors for the year ended March 31 last states that the net profit for the year amounts to £19,804. 18s. 9d., and after providing for debenture interest, the payment of the interim dividend, and other items set out in the net revenue account, there remains, with the sum brought forward from last year, a balance of £7,473. 10s. 9d. The directors propose to pay a final dividend at the rate of 5 per cent. per annum for the half-year, free of income-tax, making, with the interim dividend paid in January last, 5 per cent. for the year, and to carry forward a balance of £1,098. 10s. 9d. In spite of the business of the Company during the year having been the largest on record, both in the manufacturing works at Chelmsford and the contract department in London, there is a diminution in the net profits. This has been due to the continuance of the keen competition referred to in the directors' last report, and the consequent reduction in prices. To meet this competition many economies in the cost of manufactures have been introduced at Chelmsford, with the result that the margin of profit on present market prices is more satisfactory.

The **Chairman** said that the past year had been one of exceptionally hard work and very small profit. The poorer results had not been due to any want of energy on the part of the staff, for the sales had been by far the largest the Company had had to deal with. Competition had been very keen, and there had been very little profit to be made. Three years ago, when lighting on a large scale was concerned, there was really only three competitors, but now there were from 15 to 20. Municipal work a few years ago was fairly remunerative, but now the competition was fiercer in it than in any other. In 1899 the Company had got an order for a certain machine at £3,456, but a short time ago it had tendered £2,886 for the same article, and had not been low enough. No doubt the Germans and Americans were causing a good deal of trouble by selling their surplus stocks here. There was a good deal of truth in the statement that England was a dumping ground for surplus stocks. If protection could be got for the electrical industry only he would vote for it with both hands, but with general protection he was afraid it would be jumping "out of the frying pan into the fire." The remedy lay in the reforming of methods. A standardising of patterns would make competition with foreigners more easy. With hard work he hoped to see the Company go back to the good times of a few years ago.

The report was adopted.

BLACKPOOL AND FLEETWOOD TRAMROAD.

The half-yearly balance-sheet issued by the directors for the period ended June 30 last shows that the amount expended on the permanent way during the half-year was £382. 17s. 3d., making a total expended on it since the commencement of £197,987. 0s. 2d. The revenue account for the half-year, with the totals for the corresponding half-year, are as follows: Maintenance of ways and works, £686. 13s. (£635. 15s. 4d.); engine power, £1,898. 6s. (£1,819. 14s. 5d.); repairs to cars, £509. 19s. (£642. 5s. 1d.); traffic expenses, £2,063. 4s. 7d. (£2,062. 2s. 7d.); general expenses, £685. 6s. 9d. (£618. 16s. 4d.); and rates, taxes, and insurance, £971. 1s. 2d. (£871. 10s. 5d.) The income from traffic receipts was £10,550. 0s. 8d., as against £9,513. 10s. 9d. The balance available for dividend is £3,927. 9s. 8d. Of this amount £3,000 will be absorbed in paying 4 per cent. dividend for the half-year, £661. 11s. 6d. will be written off for depreciation reserve, and the balance of £265. 18s. 2d. is carried to the next half-year. The car mileage run during the half-year was 225,692 miles, as against 218,042 for the corresponding half-year.

METROPOLITAN DISTRICT RAILWAY.

The report of the directors for the half-year ended June 30 last, after recommending a dividend on the 4 per cent. guaranteed stock at the rate of 2 per cent. per annum, leaving £342 to be carried forward, states that the Ealing and Harrow Railway was opened on June 28, and is being worked by an electrical service of trains. The delay of the Metropolitan Company in the construction of the Harrow and Uxbridge Railway still inflicts considerable loss upon this Company. The work of converting the railway from steam to electrical traction is steadily progressing. The power-house at Lots-road is well advanced. The sub-stations are in a forward condition, and all necessary arrangements have been made with the Board of Trade and the public authorities for laying the cables. A consultative committee of the District and Metropolitan Companies has met from time to time to confer upon any electrical questions affecting the two companies.

GREAT NORTHERN, PICCADILLY, AND BROMPTON RAILWAY.

The half-yearly ordinary meeting of shareholders in this Company was held on Saturday at Hamilton House under the presidency of Sir Henry Fowler.

The **Chairman** said that the capital expenditure during the half-year amounted to £658,331. The accounts showed that the expenditure up to Dec. 31, 1902, was £241,995. The total expenditure, therefore, to date was £900,326. The amount of share capital created was £4,825,000, and the amount still unissued was £4,003,450. The estimated expenditure for the current half-year was £750,000. The engineer's report showed satisfactory progress with the construction of the works. The rent became due from the Underground Electric Railways Company, Limited, on Saturday. He moved the following resolution: "That a dividend for the period from the respective dates of the respective instalments to Aug. 1, 1903, is hereby declared at the rate of 4 per cent. per annum, less income tax, payable to all shareholders on the register of the Company at the last-mentioned date, other than the Underground Electric Railways Company of London, Limited (or their nominees, Henry Smith and Thomas James Russell), according to the amounts paid or credited as paid on their shares.

Lord Farrer seconded the motion, and it was carried.

ANGLO-AMERICAN TELEGRAPH.

The half-yearly meeting of the shareholders in this Company was held on Friday at Winchester House, E.C., Mr. F. A. Bevan presiding.

The **Chairman** said that the Company had had to repair one of its deep-sea cables and £13,190 had been charged to the renewal fund, but that amount would not cover the whole cost, and another amount of the same magnitude might have to be added. The Company always had to face the contingency that one of its old cables would break down, and that it would be unable to lift it for repairs. The International Telegraphic Conference had been held, but the companies invited to attend it had no votes. The tendency of the conference was to reduce the companies' profits. The Governments had not got to pay dividends, but only to consider the advantages to the public. The tendency in the present case had been to reduce the companies' profit, but he hoped not to any considerable extent. The senders of telegrams wanted to use longer words, to the disadvantage of the companies. Shareholders, however, need not be greatly alarmed about their interests, and they had no great reason to complain. He was not very sanguine about the prospects for the next half-year, but hoped they would be as satisfactory as the last half-year.

The report and accounts were adopted.

LIVERPOOL OVERHEAD RAILWAY.

The report of the directors of this Company for the half-year ended June 30, 1903, states that the gross revenue receipts amounted to £41,664. 6s., and the working expenses to £32,005. 8s. 9d. The number of passengers carried during the half-year was as follows: first-class, 759,180; second-class (including tramways), 3,334,793; workmen (special return tickets), 1,420,116—total, 5,514,089, which indicates a satisfactory increase, and although the working expenses, due to the acceleration of the trains, are larger, yet the service has proved to be popular, and is leading to a steady improvement in the number of travellers. The Bill of the Cheshire Lines Committee for powers to effect a junction with the railway at the Herculaneum Dock has received the Royal assent. The Bill of the Seaforth and Sefton Junction Railway, which will connect with the line at Seaforth, has passed the committees of both Houses of Parliament. The negotiations with the Lancashire and Yorkshire Railway have made good progress. When the railway is connected up with these important main lines it will form a valuable link in their through traffic, from which considerable advantage is anticipated. The revenue account shows that the receipts from passenger traffic and miscellaneous receipts and interest amounted to £41,664. 6s. The working expenses amounted to £32,005. 8s. 9d., leaving a balance of £9,658. 17s. 3d., which, after deducting interest on mortgage debentures, £3,800, and adding balance brought forward Dec 31, 1902, £4,013. 8s. 7d., leaves £9,872. 5s. 10d. available for dividend. Out of this balance the directors recommend the declaration of dividends at the following rates (less income tax): 5 per cent. per annum on preference shares, £3,000; 1¼ per cent. per annum on ordinary shares, £3,125; leaving a balance of £3,747. 5s. 10d. to be carried forward to next half-year.

METROPOLITAN RAILWAY.

The total receipts for the half-year ended June 30, 1903 (deducting this Company's proportion of the revenue of the City lines and extensions), have been £424,467, and the expenses £211,251, leaving a profit of £213,216. The directors recommend a dividend upon the ordinary stock for the past half-year at the rate of £2. 10s. per cent. per annum, and to carry forward the balance of £26,255 to the next half-year's accounts. The British Westinghouse Electric and Manufacturing Company, Limited, are making satisfactory progress with the building of the power station at Neasden, and the generating plant and machinery are well in hand. The sinking of the two wells has been completed, and prolonged tests show an ample supply of water to be available. A reservoir is being constructed adjoining the generating station for the storage of water and for condensing purposes. It will be completed in about a month, when it will be filled from the two wells. The new railway from Harrow to Uxbridge, connecting with the railway at the former place, is approaching completion, and is being equipped throughout for electric traction. In view of the capital expenditure required for the electrification and works in connection therewith, resolutions will be submitted at the special meeting providing for the creation of the capital authorised to be raised by the Metropolitan Railway (Various Powers) Act, 1884, and the Manchester, Sheffield, and Lincolnshire Railway (Extension to London) Act, 1893. These capital powers were not required for the objects for which they were originally authorised, and parliamentary sanction has been given to their being applied to other of the Company's purposes.

NORTH METROPOLITAN TRAMWAYS.

The report of the directors for the half-year ended June 30 last states that the long-standing negotiations with the West Ham Corporation have been at length concluded, and the purchase of the lines within the Corporation area was carried into effect on June 30 last. The price to be paid for the depôts has yet to be settled. Referring to the sale which has recently taken place of the Company's lines in Middlesex to the Metropolitan Electric Tramways, Limited (mentioned in the directors' last report), it has now been decided to apply to the Board of Trade for permission to sell certain small portions of tramway within the county of London which still remain in the possession of the Company, and the user of which has been granted to the Metropolitan Electric Tramways, Limited. A resolution authorising the directors to carry out this sale will be submitted to the meeting.

GREAT NORTHERN AND CITY RAILWAY.

The directors in their report state that the main line from Moorgate-street, through Old-street and Essex-road, to Drayton-park station is now almost completed. The extension from Drayton-park to Finsbury Park is in a forward state, and the whole of the tunnels are expected to be completed by the end of August. The various and complicated arrangements at Finsbury Park Station are in a forward state, and it is expected will be completed by the end of the year. The station at Highbury, authorised by the Company's Acts, 1902 and 1903, is in course of construction. Preliminary arrangements are being made for an early commencement of the extension from Moorgate-street to the Bank at Lothbury, a work also sanctioned by the Company's Acts of 1902 and 1903. The electrical installation is completed and ready for working.

BRISTOL TRAMWAYS AND CARRIAGE.

The directors (Mr. George White presiding) at their meeting held on the 22nd inst. declared an interim dividend to June 30 last at 8½ per cent. per annum, the warrants for which will be posted to the shareholders on Aug. 7. The total receipts of the Company for the half-year were £121,934. 16s. 3d. against £111,849. 6s. 11d., an increase of £10,085. 9s. 4d. over the corresponding period, whilst the number of passengers carried was 21,398,765 against 19,523,245, an increase of 1,875,520. The interest on debenture stock, the preference dividend and interim dividend of 8½ per cent. per annum absorbs £35,316. 12s. 3d. against £34,075 in the corresponding period.

NEW COMPANIES REGISTERED.

Ekstromer Accumulator Company, Limited (78,175).—Capital, £25,000. Object: to acquire a patent, provisionally accepted in the name of E. O. Ekstromer and another, numbered 7,773 of 1903, relating to improvements in accumulators and apparatus for preparing and applying the same, and any foreign patents to be granted in respect thereof, to adopt an agreement with E. C. Ekstromer, G. H. Lloyd, and C. von Buch, and to carry on the business of manufacturers of and dealers in accumulators, dynamos, and electrical apparatus generally.

North Wales Power and Traction Company, Limited (78,193). Capital, £270,000. Object: to enter into contracts (1) with Bruce Peebles and Co., Limited; (2) with the Northern Counties Traction Company, Limited; (3) with J. Tomkinson, M.P., and Colonel H. Platt, C.B.; and (4) with the Portmadoc, Beddgelert, and South Snowdon Railway Company, and to carry on the business of electricians, electrical, mechanical, and general engineers, suppliers of light, heat, and power by electricity, galvanism, magnetism, gas, water, or otherwise, owners of tramways, railways, motorcars, and other means of transport, etc.

Nottingham Electrical Company, Limited (78,168).—Capital, £1,000. Objects: to carry on the business of electricians, suppliers of electricity for light, heat, motive power, etc., dealers in all apparatus and things for the generation, supply, distribution, accumulation, and employment of electricity; electrical and general engineers. Registered office: 13, Farmers' Factory, Sherwood-street, Nottingham.

British Electric Separating Company, Limited.—Capital, £6,000. Objects: to acquire the business of tin strippers, carried on at Swansea by Mr. H. A. Leaver, as "H. A. Leaver and Co.," and to carry on the business of stripping tin from tinplate scrap and other articles by electricity or otherwise and other business connected with the electro-deposition of metals. Registered office: Newcut-road, Swansea.

West London.—The following curt reply has been received by a correspondent who recently wrote to the manager of the London United Tramways asking, on behalf of the working classes, that ½d. fares be adopted by the company as has been done by the London County Council: "I am requested to inform you that it is not contemplated to introduce ½d. fares upon the system of the London United electric tramways."

CONTRACTS FOR ELECTRICAL SUPPLIES.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Grimsby.—The Corporation invite tenders for a three-wire motor balancer and for automatic stokers. Tenders by 24th inst.

Brighton.—The Town Council invited tenders for the supply of meters for a period of one year from Sept. 1, 1903. Tenders by Aug. 10. Advertisement in last issue.

Accrington.—Tenders are invited for the electric lighting of new Wesleyan Sunday School. Specifications can be had from Mr. Pollard Barlow, 6, Hest-bank, Rough Lee-road, Accrington.

Sydney.—Tenders for the dynamo and engine for the tramways will close on Sept. 12. Particulars may be obtained from the Agent-General for New South Wales, 9, Victoria-street, Westminster.

London, S.W.—The London County Council invite tenders for two low-tension feeder switchboards. Particulars may be obtained at the County Hall, Spring-gardens, S.W. Tenders by 10 a.m. on Aug. 11.

Derby.—The Baths Committee invite tenders for the electric wiring of the Reginald-street Baths. Specifications, etc., may be obtained from the Borough Electrical Engineer, Full-street. Tenders by Aug. 11.

West Ham.—The Borough Council invite tenders for traction switchboard, etc. Particulars from Borough Electrical Engineer, Abbey Mills, West Ham. Tenders by 4 p.m. on Aug. 21. See advertisement.

Avila.—The Department of the Interior, Madrid, require tenders for an electric light installation for public and private lighting. The latter will require about 6,000 lamps. Particulars from the above. Tenders by Aug. 22.

Middleton (Lancs).—The Corporation invite tenders for the supply and erection complete at their electricity works of a grease extractor. Particulars may be obtained from Mr. S. Pauls, borough electrical engineer. Tenders by Aug. 11.

Madrid.—The Posts and Telegraph Department require tenders for installation and working of a telephone system in Gerona for twenty years, and also for installation of telephone between Gijon and Pola de Siero. Tenders by Aug. 21.

West Ham.—The Town Council invite tenders for traction switchboard, etc. Further particulars may be obtained from Mr. James K. Bock, Abbey Mills, West Ham. Tenders may be sent to Mr. Fred E. Hilleary, Town Hall, West Ham, by 4 p.m. on 21st inst.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Utrecht.—The Town Council will receive tenders for supply and erection of a central electric establishment for lighting, power supply, and working tramways. Contract, conditions, etc., to be obtained at the "Gemeente Secretaire" of Utrecht, on payment of 5fl. (8s. 4d.). Tenders by Oct. 1.

Nelson.—The Education Committee invite tenders for the wiring of and the supply and fixing of electric fittings, etc., at the new Whitefield elementary schools in Norfolk-street. Specification, etc., may be obtained from Mr. W. Alan Fraser, borough electrical engineer. Tenders by noon on 8th inst.

Swindon.—The Corporation invite tenders for the supply, delivery, and laying of all the rails, points, crossings, and accessories for the permanent way of the Corporation's tramways. Particulars from the engineers, Messrs. Lacey and Sillar, Manchester and Westminster. Tenders by Aug. 26. See advertisement.

Launceston (Tasmania).—The Mayor and Aldermen invite tenders for the supply of 500 or more electric meters. Particulars may be obtained on application to Mr. William Corin, city electrical engineer, Launceston, Tasmania, or to Messrs. John Terry and Co., 7, Great Winchester-street, London, E.C. Tenders by Sept. 28.

London, S.W.—The London County Council invite tenders for the supply and delivery of two low-tension feeder switchboards, and for the erection of one of them in each of the Council's sub-stations at Camberwell and New Cross respectively. Particulars may be obtained at the County Hall, Spring gardens, S.W. Tenders by 10 a.m. on Aug. 11.

London, S.E.—The London County Council invite tenders for the supply, delivery, and erection in the electricity generating station to be established by the Council at Greenwich of four 5,000-h.p. vertical-horizontal steam-engines, each suitable for driving a three-phase generator. Particulars, etc., may be obtained at the County Hall, Spring-gardens, S.W. Tenders by 10 a.m. on Oct. 6.

Madrid.—The Posts and Telegraphs Department require tenders for the supply of 25 telegraph apparatus of the Hughes system and 25 motors with weight elevators for the same, for the service of the telegraph stations of the State, at the upset price of 2,530 pesetas, or about £73, for each apparatus with its accessories as detailed, and 408 pesetas, or about £12, for each motor with its corresponding elevator.

Cardiff.—Tenders are required for new electrical department for lupus treatment, etc., at the Cardiff Infirmary. Plans, etc., may be seen at the office of the architect, Mr. Edwin Seward, F.R.I.B.A., from whom bills of quantities may be obtained on payment of cheque for £1. 1s., to be returned on receipt of a bona fide tender. Tenders, endorsed "Electrical and X-Ray Department," to be delivered to Mr. Leonard D. Rea, secretary and general superintendent, by 12 noon on 18th inst.

Cheadle.—The Urban District Council are prepared to receive tenders for the supply of materials and execution of works in the laying of concrete foundations, fixing rails, points and crossings for the tramway permanent way complete, including taking up present macadam and paving setts, but except fixing bonding. Particulars may be obtained on application to Mr. Chas. R. Brady, A.M.I.C.E., 13, Warren-street, Stockport. Tenders by 12 noon on Aug. 17.

Birmingham.—The Tramways Committee require the names of contractors who are desirous of tendering for the supply and delivery of materials and fittings as follows: (Section A) manganese steel points and crossings; (B) tapered steel side poles and bracket arms; (C) suspension ears, pull-offs, section insulators, and other overhead materials; (D) hard-drawn copper trolley wire and stranded steel span wire. Mr. John Price, city engineer, Council House, Birmingham.

Northampton.—The Corporation are prepared to receive tenders for the supply, delivery, and erection of the following in connection with the Corporation electric tramways: (Section No. 1) boilers, steam, exhaust, and water piping, condenser, cooler, water-softening plant, mechanical draught, etc.; (2) steam generators, dynamos, battery, and booster, switchboard, travelling crane, station lighting, etc.; (3) overhead trolley equipment; (4) underground feeders, pilot, and telephone wires; (5) cars; (6) permanent way; (7) power station buildings; (8) car-sheds, workshops, offices, etc. Particulars on application to the borough engineer, Mr. Alfred Fidler, A.M.I.C.E., Guildhall, Northampton. Tenders by 12 noon on Aug. 15.

Northampton.—The Corporation invite tenders for the supply, delivery, and erection of the following in connection with the electric tramways: (Section No. 1) boilers, steam, exhaust, and water piping, condenser, cooler, water-softening plant, mechanical draught, etc.; (2) steam generators, dynamos, battery, and booster, switchboard, travelling crane, station lighting, etc.; (3) overhead trolley equipment; (4) underground feeders, pilot, and telephone wires; (5) cars; (6) permanent way; (7) power station buildings; (8) carsheds, workshops, offices, etc. Trades union rates of wages and hours of labour apply to the contract. Drawings may be seen and forms of tender obtained after 25th inst. from Mr. Alfred Fidler, A.M.I.C.E., Guildhall, Northampton. Tenders to Mr. Herbert Hankinson, Guildhall, Northampton, by 12 noon on Aug. 15. See advertisement.

RESULTS OF TENDERS.

Derby.—The tender of the Lancashire Dynamo and Motor Company has been accepted for two sets of balancers, one set of reversible boosters for lighting, and one set of automatic reversible boosters for traction.

Reigate.—The Town Council have accepted the tender of C. Nightingale and Sons, Lesbourne-road, Reigate, at £2,023, for the construction of extensions to their electric lighting station near to Wray Common-road.

Bracebridge Asylum.—The following tenders are under consideration: Chloride Electric Storage Company, supply and erection of a storage battery, etc., £459; W. Foster and Co., supply and erection of two engines and dynamos, one motor-generator, main switchboard, meters, etc., £1,211; H. T. Hazzledine, supply and fixing of electric wires, switches, etc., £2,250.

Superheated Steam.—Messrs. Easton and Co. report recent orders for Schmidt and Bolton superheaters, amounting in all to 9,000 h.p., the purchasers being as follows: Durham Street Weaving Company, Belfast; Metropolitan Electric Supply Company (six); J. and E. Hall, Dartford, Kent; Kirkpatrick Bros., Ballyclare; Shirebrook Colliery Company; Thomas and Green, Wooburn Green.

Norwich.—The following tenders have been accepted: Accessories (at schedule prices) to March 31, 1904—Edison and Swan United Electric Light Company, Hull; Hands Bros., 30, Snow-hill, London, E.C.; Metallic Seamless Tube Company, Birmingham. Meters (at schedule prices)—Schattner Electricity Meter Company, Upper-street, London; Chamberlain and Hookham, Birmingham; Johnson and Phillips, Old Charlton, Kent, centrifugal pump and motor, £150.

Roofing.—Messrs. Mellowes and Co., Sheffield, and 28, Victoria-street, Westminster, report orders for the glazing for the following roofs on their "Eclipse" patent imperishable system; Dick, Kerr, and Co.'s premises, Preston; Ipswich electric station and car sheds; gasworks, Tynemouth; Yoker generating station; Motherwell generating station; Bath generating station; car sheds, Bath; Swan and Hunter's premises, Newcastle-on-Tyne; Guinness's Brewery, Dublin; National Gas-Engine Company's premises, Oldham; new tyre shop for Messrs. J. Brown and Co., Sheffield.

Bath.—The Corporation have received the following tenders for the supply and erection of a main switchboard at their new generating station, Dorchester-street:

Verity's Limited, King-street, Covent Garden, London.	£1,434	0	0
Johnson and Phillips, Old Charlton, Kent	1,540	0	0
Electric Construction Company, Dashwood House, 9, New Broad-street, E.C.	1,543	0	0
J. G. Statter and Co., Birmingham (accepted)	1,544	0	0
Crompton and Co., 4, Queen Victoria-street, E.C.	1,560	0	0
Cowans, Springfield-lane, Salford, Manchester	1,574	0	0
Electrical Company, Limited, London	1,580	0	0
Siemens Bros. and Co., 12, Queen Anne's-gate, Westminster	1,632	0	0
General Electric Company, 67, Queen Victoria-street	1,650	0	0
Witting, Eborall, and Co., London	1,670	0	0
Kelvin and White, Glasgow	1,686	17	6
Ferranti Limited, Hollinwood, Lancs.	1,750	0	0
E. F. Moy, Limited, Greenland-place, Camden Town, London, N.W.	1,985	0	0

BUSINESS NOTES.

TRACTION.

Middlesex.—The laying of the tramway tracks in the Edgware and Great North roads is to be proceeded with by the present contractors.

London's Tube Railways.—It is stated that London's tube railway schemes, realised and projected, involve the investment of upwards of £50,000,000.

Manchester.—The Corporation Tramways Committee have revised the fares on many routes, introducing fares of 1½d. in a large number of cases where 2d. is now charged.

Rotherham.—The Corporation trams carried considerably over twice the total number of the population of the borough during the week ended on Thursday, the 30th ult.

Crewe.—A proposal to withdraw the Council's support to the tramway scheme being promoted by a syndicate for the town was defeated at Wednesday's meeting of the Town Council.

Beckenham.—The constructional plans of the proposed tramways have been approved, the company having agreed to pave the track in Croydon-road and Beckenham-road with wood at their own expense.

Liverpool.—The City Council on Wednesday refused to confirm the decision of the Tramways Committee not to proceed with the construction of a line of tramways connecting Lodge-lane with Aigburth-road.

Dumbarton.—The enquiry under the Private Legislation (Scotland) Act into an application for a provisional order in connection with a tramway scheme for Dumbarton was held on Friday. There was little opposition, and the preamble was proved.

Southampton.—The Tramway Committee have decided to charge 1d. fares only to all passengers before 7.30 a.m. Consideration of the subject of return tickets has been referred to the chairman to make enquiries at the conference to be held at Glasgow.

Batley.—Disappointment prevails that the electric cars will not run in the borough for the present. It is understood that the cars are not yet ready. It was hoped that the public service would come into operation directly after Major Druitt's official inspection last week.

Liverpool Overhead Railway.—A fire, fortunately confined to the driver's cabin, occurred on one of the trains leaving Prince's Dock Station on Wednesday last week. The fire brigade was summoned, and the fire extinguished. It is supposed to have been caused by a short-circuit.

Barnsley.—The Town Council have recently been considering the question of the purchase of the undertaking of the Barnsley and district tramways scheme, but at a meeting last week the committee before whom the matter was brought decided not to purchase on the terms suggested.

Hayes.—At a special meeting of the Parish Council a resolution was passed that the Council, whilst not opposing the extension of time applied for by the tramway company, at the same time expressed their earnest hope that the Board of Trade will insist on the company completing the work within the time now stated.

Lewisham.—The Borough Council have rescinded their resolution, "That the London County Council be informed that the Lewisham Borough Council will be prepared to consent on terms to the introduction of the tramways proposed in their letter dated June 14, but decline to make any contribution to the cost of the same."

Brighton.—The Tramways Committee have considered a long report from the engineer and manager, Mr. Holliday, in reference to the proposed tramway along the Preston-road, from the junction with Beaconsfield and London roads to the borough boundary near Clermont-road, making several recommendations as to the manner in which the work shall be carried out.

Wolverhampton.—After a lengthy discussion the Town Council have adopted a resolution calling on the Tramways Committee to establish communication with outside districts without delay. The debate arose out of a memorial presented by the local tradesmen's association asking for the removal of the isolation of Wolverhampton from neighbouring towns which now exist.

Stockport.—Colonel von Donop visited Stockport on Saturday on behalf of the Board of Trade to inspect the extension of the Corporation tramways on the Cheadle side of the borough. The portion inspected was the length from the Robin Hood Inn to the borough boundary. He gave his sanction to the immediate running of the cars, and after the inspection the public were able to utilise the route.

Norwood.—As a result of a canvass of the inhabitants of Upper Norwood, made by the Upper Norwood Ratepayers' Association, it has been ascertained that 2,328 inhabitants are in favour of the introduction of electric trams, whilst 448 are against it, and 223 are neutral. A memorial is consequently being prepared praying the London County Council and the Croydon Council to extend their electric tram system to Upper Norwood.

Lambourn Valley.—An enquiry has been held at the Board of Trade to hear objections to the application for the light railway order. Sir Herbert Jekyll, after hearing Mr. Bayliss, objector, and Messrs. Le Brasseur and Squires on behalf of the company, said he would report to the Board of Trade, but did not think he would be justified in holding out strong hopes that the Board would accede to the addition of 25 per cent. to maximum rates.

Ashton.—Negotiations are proceeding between the Corporation and the Manchester Carriage Company with regard to the cost of the taking over of the tramways and as to the inclusion of the depôt in Cowhill-lane and about a dozen cars and 144 horses, which it is contended are Ashton's share of the liability. A deputation is to wait upon the representatives of the company, and it is hoped the matter will be settled without recourse to arbitration.

Paisley.—The purchase agreement between the directors of the existing horse tramways in Paisley and Mr. Murphy, promoter of the electric tramways, has been signed, payment to be made within two months. Mr. Parshall, Mr. Murphy's electrical engineer, has written to the burgh electrician stating his opinion that current may be wanted at the end of March, when part of the lines will be open for traffic. The whole system is expected to be open in June next year.

Lancashire and Yorkshire Railway.—A good start has been made with the laying of the cables at Southport in connection with the electrification of the Liverpool-Southport line on the Lancashire and Yorkshire Railway system. The work is being pushed through Birkdale and on to Ainsdale, and a considerable portion of the remaining distance is already completed. The chief generating station is at Formby, and sub-stations are being erected at Birkdale and Seaforth.

Aston.—The Tramways Committee report that the Birmingham District Tramways Bill, as amended by the committee of the Lords, has been submitted to a committee of the House of Commons, with the result that the clauses enabling the various local authorities who are promoting the Bill to purchase and lease the tramways in their districts before the expiry of the respective orders under which such tramways were authorised and constructed were approved by such committee.

Collision in South London.—On Saturday an accident occurred at Kennington Cross. One of the London County Council electric cars from Tooting was proceeding up Kennington-road towards Westminster Bridge when it dashed into a Brixton horse car which was leaving the stable yard. The entire front of the horse car was smashed in, while the force of the impact caused several passengers to be dislodged from their seats on the electric car. Happily no person was seriously injured.

Liverpool-Manchester Monorail.—The secretary of the Manchester and Liverpool Electric Express Railway Company states that the applications received for shares in the above company do not in the directors' judgment offer capital of a sufficient amount to guarantee the successful completion of so important an undertaking. Arrangements for the provision of the full resources required are under consideration, but meanwhile they think it advisable to allot no shares at the present stage.

Burton.—The electric trams are now in full use. A start was made on Bank Holiday, when the Mayor and members of the Corporation formally declared the system open. The Mayor said that up to the present about £80,000 had been expended. They had 5¾ miles of rails, about half of which were double. They had 20 cars, costing £550 each, 17 of which would provide a full service. A *plébiscite* of the borough is to be taken during the week on the question of running on Sundays.

South London.—Another electrical tramway has been added to the South London system. This is the branch described from the terminus at Vauxhall Station, *via* Harleyford-road to Kennington Church and Camberwell green. The cars were timed to cover the distance from Vauxhall to the Green in 12 minutes. Few of them, however, required so long, despite the heavy vehicular traffic. It is anticipated that nine-tenths of the tramway system controlled in South London by the County Council will be running electrically before the end of the year.

Kingston-upon-Hull.—The accounts of the electric tramway undertaking for the year ended March 31 last have just been issued, and reveal a healthy state of affairs. The total capital expenditure during the year amounted to £31,414. 5s. 7d. The revenue account shows a total expenditure of £48,939. 9s. 11d. as against a gross income of £92,343. 4s. 6d., leaving £43,403. 14s. 7d. to be carried to the net revenue account. After providing for interest on loans and sinking and reserve fund charges there is a handsome balance of £14,500 remaining.

Additional Traffic Returns.—Anglo-Argentine, £1,559 increase; Barcelona Ensanche y Gracia, £200 increase; Barcelona, £194 decrease; Brisbane, £85 decrease (month of July, £10,160, increase £4); British Columbia Electric (month of March), gross earnings £10,352, net income £2,658; Buenos Ayres and Belgrano Electric, £23 increase (month of July, £13,269, increase £1,142); Calcutta, £613 increase; Cape Town (month of April), receipts £16,003, expenditure £8,313; Isle of Thanet Electric, £184 decrease; Mexico Electric (month of June), receipts £46,270; Perth Electric, £125 increase; Port Elizabeth (month of April), receipts £4,292, expenditure £2,281.

Lowestoft.—The electric trams, which were opened on July 22, have up to the present justified their construction in a most gratifying manner. Having taken as much as £64 and £63 last Saturday and Sunday respectively, which were up to that time "record" receipts, these figures were far exceeded on Bank Holiday. Although actually all the cars were not in use, as many as 22,570 passengers were carried (and again hundreds were unable to obtain a ride), and the earnings reached £111. 7s. 4d. It is stated that the earnings of the cars during the first 12 days (three of which, by the way, were only half days), including about the wettest week of the season, were £729—an average of about £60. 10s. per day.

Bury, Rochdale, and Oldham.—As the result of prolonged negotiations between the local authorities and the directors of the Bury, Rochdale, and Oldham Tramways Company, a provisional agreement was come to whereby the authorities would take possession of the undertaking as from July 31. The formalities, however, have not been completed, and the agreement is not yet signed. Until this is done application will not be made to the Board of Trade to fix the date of the arbitration on the question of the price to be paid for the company's undertaking. Meanwhile the Rochdale Corporation is taking steps to complete the lines along Milnrow-road and Tweedale-

Digitized by Google

street, and as soon as possession is assumed they will have the right to begin the work of reconstruction.

West Manchester Light Railway.—The Davyhulme and Flixton Parochial Committees have received the report of the Joint Committee appointed to meet the promoters of the proposed light railway from Trafford Park to Irlam locks, which will cross on the level several main roads in Flixton and Davyhulme. The committee hold that the construction of a light railway in these residential districts would be objectionable, although to the construction of a tramway there might not be the same opposition. The promoters, who say the proposed scheme is simply an extension of the powers they have already acquired in Trafford Park, point out that the construction of the line will develop the townships named and will lead to the erection of considerable new property to accommodate the men now employed in the park.

Leeds.—An amicable arrangement between the Tramways Committee and their employés is being negotiated. Permission, however, has been granted to the men by the Amalgamated Association of Tramway and Vehicle Workers to enter upon a strike at an early date if the committee will not accede to their demands. Fresh terms have been offered by the organising secretary of the union, and the committee are now considering these modifications of the original terms. It is hoped that within a short time a rearrangement of hours and wages may be arrived at which will be mutually satisfactory both to the men and the committee. On Wednesday it was decided to grant the men concessions in wages and hours which represent an increased expenditure to the department of £4,600 per annum. There is a probability that the men will demand still more, as the minimum for which they have been agitating has not been reached.

Accident.—The Salford borough coroner has held an inquest on the death of Nathaniel Leather, aged 31, a carter, who was killed in a collision between a tramcar and a lurry in Salford. Witnesses stated that at 10.30 on Saturday morning they saw Leather riding on his lurry, and noticed him stop at the shop of a butcher. The man was next seen turning his lurry round. He got the lurry half turned when an electric tramcar collided with it and pushed it along the road for a few yards. Leather was knocked off his seat and injured so badly that he died. Alfred Lacey, the car driver, said he saw Leather at the corner of Howard-street attempting to cross the road and get round another lurry. Witness sounded his gong and gave Leather a signal to get out of the way. Leather, however, suddenly drove across the road and turned his lurry on the tramline. It was impossible then to avert the accident. Other witnesses stated that they did not see a second lurry. The jury returned a verdict of manslaughter against the driver, and he was committed to the next Manchester Assizes on the coroner's warrant. The coroner accepted bail in two sureties of £25 and Lacey in £50.

Tramways Competition with Railways.—At the meeting of the South-Eastern Railway Company the Chairman said there was a considerable increase in the short third-class journeys. He could not help thinking that the trams had more or less had their day, and that owing to the increasing punctuality and regularity of their suburban service, the third-class passengers, whose time was most valuable, were coming back to the railway as the most certain way of getting to business. Speaking at the half-yearly meeting of the Lancashire and Yorkshire Railway Company on Wednesday, Sir George Armytage said there could be no doubt that the falling off in the number of passengers carried was entirely due to the fact that the tramways had taken a great many short-journey passengers from them; but he was pleased to be able to say that their efforts to encourage passengers to take longer journeys had again been successful, and he thought, therefore, they might fairly claim that in spite of the tramway competition they had been able to hold their own in all classes, having received considerably more revenue for passenger traffic than in the corresponding half-year, notwithstanding the diminution in numbers.

Private Bills.—On Friday the following Bills were read a third time and passed in the House of Lords: Stroud and District Tramways Bill, Erith Tramways and Improvement Bill, and North Metropolitan Electric Power Supply Bill. In the House of Commons, on the consideration of the Lords' reasons for disagreeing to one of the Commons' amendments to the Carmarthen Electric Power Bill, Mr. J. W. Lowther moved, "That this House do not insist on their amendment." The motion was agreed to. The following Bills were read a third time: the Nottinghamshire and Derbyshire Tramways Bill, and the Hove, Worthing, and District Tramways Bill. In the House of Lords on Tuesday last week the Baker-street and Waterloo Railway (Extension of Time) Bill was read a third time. In the House of Commons the Lords' amendments to the following Bills were considered and agreed to: the Great Northern, Piccadilly, and Brompton Railway (Various Powers) Bill, and the Watford and Edgware Railway Bill. The following Bills were read a third time: the Dewsbury, Batley, and Birstall Tramways Bill, the Manchester Southern Tramways Bill, and the Worthing Corporation Tramways Bill. On Tuesday last the Lords' amendments to the following Bills were considered and agreed to: Baker-street and Waterloo Railway (Extension of Time) Bill, and the London County Council (Tramways and Improvements) Bill. The Somerset and District Electric Power Bill was read a third time.

Leeds Tramways Manager.—The proposal of the Leeds Tramways Committee to increase the salary of Mr. J. B. Hamilton, the tramways manager, from £900 to £1,200 at once, and by three annual instalments of £100 to £1,500 per annum, was defeated in Council of the Corporation on Wednesday by 25 to 30 votes. The decision was arrived at after a lengthy debate, which was chiefly characterised by disorderly interruptions from the public gallery, and the disgraceful demonstration with which the result was received by the occupants of the gallery. We cannot help thinking that in deciding not to advance Mr. Hamilton's salary the Council have allowed themselves to be influenced by the public feeling which had been voiced during the week at numberless meetings and gatherings in the city, at one of which some 6,000 people entered their protest against the proposed increase. As our readers know, Mr. Hamilton had an offer from Birmingham of £1,500 a year, which he was induced to decline on the Leeds Tramways Committee agreeing to recommend the Council to advance his salary to that figure within three years. In declining Birmingham's offer Mr. Hamilton was obviously putting his own private interests on one side, but we doubt whether he would have so far sacrificed himself had he not regarded his committee's promise of an increase as practically binding on the Council. As it is, the appointment at Birmingham has been filled, and Mr. Hamilton's salary remains as it was before. Throughout the debate in the Leeds Council signs are not wanting of the reputation he has established for himself as an administrator during the time he has been at Leeds, and we are convinced that in refusing to compensate Mr. Hamilton for his sacrifice of his own interests to those of the city, the City Council have made a great mistake, and one which they will probably regret before very long.

Liverpool.—The auditors' annual report with regard to the tramways and electric supply undertaking was issued on Friday. It states with regard to the tramways accounts that the contribution to the sinking fund last year amounted to £51,924, and after providing this amount, in addition to all interest charges, there remained to the credit of revenue account the sum of £75,497. This balance has been dealt with according to the provisions of the Act, 1902, £50,351 being set aside for reserve, renewal, and depreciation, and the balance of £25,166 has been taken in relief of rates. In the reporters' opinion the figures justify such a transfer. In comparing the amount set aside for depreciation with the total capital expended, it must be borne in mind that a large amount of the expenditure was incurred on account of assets, acquired from the late company, that will not require to be renewed, and the debt will be fully written off by the operation of the sinking funds, and it will not become necessary to raise further sums in order to replace these assets. In such assets they class goodwill, old cars, and horses, and the old tramway lines. The cost of horses has already been written off. The sinking fund also should be more than sufficient to provide for the expenditure on the land and buildings. The assets remaining that require to be maintained to keep the concern in working order are of a capital value of about £875,000. The sum written off for depreciation, etc.—*i.e.*, £50,331—is equal to 5¾ per cent. on this figure, and the sinking funds are also providing for the redemption of the expenditure incurred on these assets. The city engineer is satisfied (having regard to the amounts charged for renewals and maintenance, £63,174. 6s. 8d., and the principle adopted for making these charges) that the amount set aside for depreciation, in view of the sinking funds in operation, is amply sufficient. The reporters consider it as much as, if not more than, a prudently conducted company would have written off.

Bradford.—The report on the working of the city tramways for the year ended March 31 shows that the total traffic and other receipts amount to £173,534; the passengers carried to 41,000,000; car miles run, 4,013,191; receipts per car mile, 10·377d.; average length of 1d. stage, 1 mile 1,156 yards; route miles of tramway, 39 miles 645 yards; and the electric power consumed to 6,067,387 units. The amount paid to the electricity and other departments of the Corporation has been £28,952. The revenue account discloses the fact that the total expenditure has been £117,495, of which £39,755 went in wages, £24,956 in maintenance of rolling-stock, £5,758 in maintenance of permanent way, and £1,804 in maintenance of overhead equipment, the expenditure on electricity account being £26 931. The gross income was £173,534, leaving a gross profit of £56,038. Against this has to be set interest on loans, sinking fund, etc., £36,188, leaving a net balance of £19,849. The capital of the tramways is estimated at £700,000. It will be remembered that at a meeting of the Tramways Committee held recently a general desire was expressed for the amalgamation of the committee with that of the electricity department, the ground being that the amalgamation would tend to greater efficiency and economy in view of the fact that the two committees are so closely connected in their work. The matter has come before the members of the Electricity Committee, but it has not met with much support, the idea of the appointment of a manager to look after both departments not finding favour. The committee decided to advertise for a successor to Mr. Chattock, who was until recently the electrical engineer. The arbitrator appointed to determine the amount of compensation to be paid by the Corporation to the representatives of the Bradford Tramway and Omnibus Company, Limited, for the interference of the traffic of the company during the relaying of the lines and the fitting up for electric traction has presented his award. He determines that the company are entitled to £1,698. 7s., together with the sum of £77 as interest upon that amount from Feb. 1 last year, when the tramways were taken over.

Glasgow.—The ninth annual report of the Tramways Committee of the Town Council for the year ended May 31, 1903, has been issued. The result of the year's working shows that the revenue amounted to £656,572. 7s. 11d., and the working expenses, including depreciation, to £431,870. 2s. 11d., thus leaving a gross balance of £224,702. 5s. The revenue of the previous year was £614 413. 4s. 11d., and the working expenses, including depreciation, £405,103. 0s. 7d., leaving a gross balance of £209,310. 4s. 4d. This year's gross balance thus shows an increase of £15,392. 0s. 8d. The gross balance of £224,702. 5s. has been applied in meeting interest and sinking fund, etc., on cost of Govan and Ibrox tramways, interest on capital, sinking fund, and annual payment to the common good, these payments amounting in all to £124,425. 7s. The net balance remaining amounts to £100,276. 18s., out of which an extra payment of £10,000 has been made to the common good. On account of the high rates prevailing for electrical material during the period of construction, £40,000 has been written off the cost of feeder cables and overhead equipment; £25,000 has also been written off the cost of buildings originally constructed for horse

Digitized by Google

traction. The balance, amounting to £25,276. 18s., has been added to the general reserve fund. It will be observed, the report continues, that the traffic revenue, although £40,373. 15s. 10d. in excess of the previous year, works out at ·47d. per car mile less. It will also be observed, however, that the working expenses show a decrease of ·31d. per car mile. As the lines are extended and the service of cars increased, it is quite probable that the revenue per car mile may in future be still further reduced. It may be taken, however, that the working expenses have now almost reached a minimum. The amount of the capital expenditure account on June 1, 1902, as reduced by depreciation, was £2,041,035. 19s. To this sums falls to be added £227,514. 16s. 7d., being the net amount expended on capital account throughout the year. There falls to be deducted from capital expenditure account the sum of £74,038. 14s. 7d., being the amount of the annual depreciation written off for the year, and the special depreciation, amounting to £65,000. The net amount expended on capital account as at May 31, 1903, was therefore £2,129,512. 1s. The total amount borrowed for capital purposes is now £1,889,311. 12s., of which £48,000 was borrowed during the past year. The sum at the credit of the permanent-way renewal fund is £136,789. 9s. 7d. During the year £2,071. 3s. 9d. was expended under this head. At the end of last year the amount at the credit of the general reserve fund was £383. 18s., this year the sum at credit amounts to £21,134. 10s. 8d. During the year more than 13 miles of double track extension has been constructed, and the total length of the tramways owned and leased by the Corporation now amounts to between 64 and 65 miles double track. During the past year the sum of £21,021. 4s. 5d. has been expended on the upkeep of the roadway between the tramway tracks. In addition to this sum, £53,516 has been charged against revenue, being the estimated annual expenditure necessary for the renewal of the track, calculated at £450 per annum per mile of single track. The cost of repairs to the power plant and machinery was £4,249. 16s. 2d. In addition to this sum £20,555. 4s. 9d. was charged against revenue to meet depreciation. The total number of cars in stock is 611, and at present 70 additional cars are in course of construction The total cost of inspection and repairs of cars for the 12 months was £27,529. 11s. 4d., and a further sum of £25,086. 11s. 1d. was laid aside to meet depreciation. The number of passengers carried exceeded 177 millions, and the distance traversed by the cars amounts to fully 14 million miles. The average drawing per mile is 14·19d. In exhaustive general remarks embodied in the report, the committee express satisfaction at the financial results of the first year of exclusive electric traction. The large extensions during the year, the lowering of fares, and the increased car service had all tended to keep down the earnings per car mile, but it was gratifying to note that expenses had also been considerably reduced.

LIGHTING AND GENERAL.

Bo'ness.—The generating station is to be erected on a site adjoining the gasworks, acquired by the Council some time ago.

Whitby.—The Urban District Council have decided to borrow a further sum of £2,500 for extending the electric lighting.

Carmarthen.—Two electric companies intend to apply for a provisional order to supply electric lighting in the district.

Aberdeen.—The Council have resolved to borrow a further sum of £65,000 for the purposes of the electric lighting undertaking.

Ilkeston.—The Electric Lighting Committee will charge 2d. per unit for power and 4d. per unit for lighting for the first 800 units.

Carnarvon.—Plans of the new electric light works have been adopted subject to their being approved by Sir Wm. Preece, the consulting engineer.

Stokefleming.—The Parish Council have decided to approach the Urban Electric Supply Company, Dartmouth, with regard to their terms for lighting the village.

River Wear Commission.—The agreement between the Sunderland Corporation and the Commissioners, relating to the laying of electric cables, has been sealed.

Beckenham.—The Urban District Council have decided that it be an instruction to the officers to invite fresh tenders for free wiring as soon as the Council's Bill becomes law.

St. Albans.—The Corporation have received offers from three companies to take over their electric lighting order, and have appointed Mr. E. Macgregor Duncan to advise them thereon.

Tolworth.—The new electric light works are now practically completed, and will be formally opened on Aug. 11, after which date current will be available in the greater part of the district.

Bootle.—At the last Council meeting sums to the amount of £13,000 were authorised to be borrowed for the supply of additional electrical plant required in the electricity station at Pine-grove.

Brompton and Kensington Electricity Co.—The directors have declared a dividend on the ordinary shares for the half-year ended June 30 last at the rate of 9 per cent. per annum (4s. 6d. a share).

Erith.—With reference to the proposed further loan of £20,000 for electric lighting, the Local Government Board have promised to sanction the borrowing of the money. A transformer station is proposed to be erected at Belvedere.

Fire.—We regret to hear that the buildings of the Westminster Electric Supply Corporation in Davies-street, Oxford-street, received some damage by a fire which occurred on Tuesday. Captain Hamilton, the new chief officer, was in attendance.

Argentine.—The Argentine Government have issued a decree authorising the construction of telegraph lines in the province of La Rioja between Patquia and Quines, of a total length of 411 km., for which a credit of about £11,554 has been granted.

Charing Cross and Strand Electricity Supply Co.—The directors of the Charing Cross and Strand Electricity Supply Corporation, Limited, have declared an interim dividend at the rate of 8 per cent. per annum for the half-year ended June 30, 1903.

Portsmouth.—The accounts of the Corporation's electric light undertaking for the year ended March 31 last show that during the year £28,128 was derived from the sale of current, against £24,828 from the same source during 1901. The cost of production rose by £3,158.

Goole.—The Urban Council have confirmed informal arrangements for the purchase of property in Edinburgh-street and Mason-terrace, the cost of which is estimated at £9 600, for the purposes of an electricity station, and will apply for sanction to purchase the property.

Midlothian.—The District Committee of the County Council have received notice of a provisional order granting to the National Electric Wiring Company, Limited, powers within the whole of the parish of Inveresk, and a sub-committee has been appointed to watch the interests of the District Committee in the matter.

Barnsley.—Mr. S. E. Bastow, A.M.I.E.E., has resigned his appointments as borough electrical engineer and resident engineer to the Barnsley and District Traction Company, and will shortly open offices in Manchester for Messrs. D. Bruce Peebles and Co., Limited, as their representative for the Manchester district.

Stourport.—The Shropshire and Worcestershire Electric Power Company intend to apply for a provisional order to supply electricity within the Stourport district. The Urban District Council have decided to obtain expert advice and assistance in negotiating with the company the terms on which they would lay mains and supply electricity in bulk.

Stepney.—The electric light was switched on to the Burdett-road, Mile End, last week, thus completing the present part of the installation of the Stepney Borough Council. Cable-street and other riverside streets are next to be taken in hand. Up to the present over £150,000 has been spent by the Stepney Council on the work, which last year earned a net profit of over £5,000.

Eton.—The Pumping Station Committee have adopted definitely the system of pumping by electricity, the six months' experiment being now concluded. The Windsor Electrical Installation Company, who have executed the work to the great satisfaction of the committee, have obtained the contract, the terms being 3d. per unit for the first 6,000 units and 1½d. for each unit in excess.

Removals.—Messrs. Gent and Co., wholesale manufacturing electricians, Faraday Works, Leicester, have removed their London offices to more commodious premises at 3A, Upper Thames-street, two doors from St. Paul's Station. Mr. L. Gaster, consulting electrical engineer, has removed to 32, Victoria-street, Westminster, S.W. This notice appeared in our last issue, but the name was mis-spelt "Gaston."

Sunderland.—The estimates adopted by the Lighting and Electricity Committee for the ensuing half-year show a total estimated expenditure of £11,339. 5s. 1d., and an estimated revenue of £22,747. 2s. 11d., the estimated gross profit being, therefore, £11,407. 17s. 10d. Of this, interest will absorb £3,877. 11s. 10d., and sinking fund £7,500, so that it is estimated that the net profit will be £30. 6s.

Reigate.—At the close of the first year of its installation—March, 1902—the cost of the Town Council's electricity undertaking was £1,566, and the revenue only amounted to £955. The last quarter, however, shows an increase in the revenue of 50 per cent., and now the limit of the number of consumers the Council can at present provide for has been reached, and it will be necessary to extend the works.

Hackney Technical Institute.—The governors of the Hackney Institute have made the following appointments: head of the physics and electrical engineering department, Alfred Hay, D.Sc., F.P.S., M.I.E.E., professor of electric technology and physics at the Royal Indian Engineering College, Coopers Hill; head of the chemistry department, E. C. Jee, D.Sc., F.I.C., F.C.S., assistant lecturer and demonstrator in the chemical department of the Borough Polytechnic; head of the natural science department, E. J. Collins, B.A., natural science master at Walthamstow Technical Institute. The institute will commence work next session at the new buildings in Hackney Downs, close to Hackney Downs Station.

Bath.—On the presentation of the Electric Light Committee's report at the last Council meeting, Mr. Hatt said, in reference to the request by the committee that the Council should authorise them to accept tenders for the supply of additional switchboard, condensers, feed and other pumps and pipes in connection with the enlargement of the works, that the tenders for the supply of condensers, etc., had already been received and reported upon by Mr. Manville, who had recommended the acceptance of the tender of Messrs. Babcock and Wilcox. The tenders for the switchboard had also been received, and opened and forwarded to Mr. Manville. He could assure the Council that even if the highest tenders were accepted the cost would come well within the estimate. The report was adopted.

Stock Exchange.—The Stock Exchange Committee have appointed Aug. 18 a special settling day for British Electric Transformer Company (1903), Limited, 30,390 6 per cent. cumulative preference shares of £1 each fully and partly paid, Nos. 1 to 30,390, and 69,114 ordinary shares of £1 each fully and partly paid, Nos. 50,001 to 119,114; and ordered the South African Lighting Association's further issue of 1,000 shares of £10 each fully paid, Nos. 6,001 to 7,000 to be quoted in the official list. Applications have been made to the Exchange Committee to allow the following securities to be quoted in the official list: Edmundson's Electricity Corporation's further issue of 20,000 ordinary shares of £5 each fully paid; and Vickers, Sons, and Maxim's, £1,000,000 4½ per cent., second mortgage debentures of £100 each, in lieu of the script now quoted.

Wrexham.—The price of current for motors has been fixed at 2½d. per unit within the regulation area, and the minimum reduced from £10 to 30s. The borough electrical engineer, in his last report, states that the units generated during June, 1903, were 29,094, as against 8,164 in 1902. One consumer had been connected during the month—20 lamps of 8 c.p. The total number of consumers now connected was 130.

Hamilton.—The lessees under the Corporation—the Edmundsons' Electricity Corporation, Limited—commenced their 24 hours' continuous supply on Friday last, and announced that they were in the position to guarantee a current for lighting and power at all hours. Already the light has been very largely taken advantage of, and we are informed the consumers are satisfied with the result alike as regards cost and efficiency.

Holidays.—We have received an advance copy of this year's issue of the Great Eastern Railway Company's handbook "Holiday in Eastern Counties," edited by Percy Lindley. Prominence has been given to some less known districts in East Anglia, and the illustrations have been made a special feature, and a list of East Anglian golf links has been added. The little book is well got up and teems with useful information of all kinds.

Willesden.—Lord Stanmore's committee of the House of Lords have ordered the report for third reading of the Bill which seeks to empower the North Metropolitan Electric Power Supply Company to purchase from the Willesden Urban District Council a power generating station situated in Willesden, and to authorise the company, after the purchase, to supply electricity in bulk to certain bodies, including the Willesden Council.

Finchley.—The engineer in his last report states that the buildings were sufficiently advanced to enable the work in other departments to proceed. The contractor would probably finish at an early date. Two of the boilers had passed the preliminary test, and were being bricked in. He had arranged for the work to proceed at all hours between daylight and dark. Considerable progress had been made in the laying of the cables, and a large amount of jointing-up had been done.

Luton.—The electrical engineer in his last report states that since June 19 7,293 units had been generated, an equivalent to 373 8-c.p. lamps and five motors of 16 h.p. connected, making a total of 110 consumers with 7,776 lamps and 21 motors of 64 h.p., and that at the present time over 660 additional lamps and seven motors of 17 h.p. were being wired. The number of units generated was an increase of 88 per cent. over the number generated during the corresponding period of last year.

Croydon.—The Lighting and Electricity Committee have adopted the report and estimate noted in our last issue, and application is to be made for sanction to the borrowing of £70,950. The borough electrical engineer's last report states that 11 applications have been received, being equivalent to 479 8-c.p. lamps; 16 consumers have been connected, being equivalent to 694 8-c.p. lamps. He appended the following figures: private lighting, current sold, 1903, 51,141 units (corresponding period last year, 35,630 units); public lighting, 24,948 units (17,868 units); traction, 92,080 units (81,811 units).

Guildford.—The Guildford Electricity Supply Company, Limited, have been requested to extend their mains by the main Epsom road to the village of Merrow. On account of the expense required they have asked the Council to allow them to erect overhead wires. The Board of Trade have no objection to this if the consent of the local authority is obtained. The matter has been referred to the County Council, with an expression of the Rural Council's opinion that it was not desirable that electricity should be conveyed by means of overhead wires. The Inland Waterways, Limited, intend to apply to the Board of Trade next session for a provisional order to enable them to supply electricity in the Council's district.

Carmarthenshire Electric Power Bill.—In the House of Commons last week the Lords' reason for having disagreed to one of the Commons' amendments to the Carmarthenshire Electric Power Bill was considered. Mr. J. Lowther moved that the House do not insist on the amendment to the Bill providing that the expression "authorised undertakers" means any authority authorised by any general or special Act to undertake or contract for the lighting of streets, bridges, or public places within any part of the area of supply as defined by the Act. The ground of the Lords' objection to this amendment was that the expression "authorised undertakers" did not appear elsewhere in the Bill. The motion was agreed to.

Egypt.—Messrs. Eug. Nahman and Co. have obtained from the Egyptian Railways Administration an order for the electric lighting plant of the Gabbary Station, Alexandria. The whole plant comprises two groups of 55 arc lamps each, in series, and 200 incandescent lights. The engine-house comprises three groups of Robey's compound high-speed vertical engines and condenser; Babcock and Wilcox's steam boilers with economisers; and superheaters, series-type dynamos, and arc lamps of the Brush Electrical Manufacturing Company's make; also two groups of Crossley's oil-engines, and shunt dynamos of Brown-Boveri's make. The work is being carried out under the supervision of their engineer, Mr. R. Levi, C.E.

West Bromwich.—The Highway Committee of the Corporation have issued a report with respect to the lighting test between gas and electricity which has been going on in the town's main thoroughfare for some three months past, and which has created considerable local interest. After the experiment had been carried out the respective committees submitted quotations of the prices at which they would be prepared to continue the lighting of the tramway poles. The committee, after carefully considering the matter, recommend that electric lighting by means of two 1,000-c.p. arc lamps on alternate poles be adopted from Carter's Green to the Beeches-road, and that the existing gas lamps be removed. The net cost will be £600 per annum.

Londonderry.—At a special meeting of the Corporation last week a motion was carried in favour of issuing mortgages of the rates for the purpose of carrying out the private electric lighting and power scheme at a cost of about £15,000. It will be remembered that the Local Government Board had sanctioned the loan, but the Board of Works refused to issue the money on the ground that the electric light scheme was a commercial enterprise, and the Corporation could issue stock for both purposes. The Corporation, however, found that stock could not be issued at the rate of interest and minimum price fixed by the regulations made under the Local Government Board under the Public Health Amendment Act, and therefore will issue mortgages on the rates.

North-Western Electricity and Power Gas Bill.—The promoters of this Bill intend to ask Parliament, now that Cheshire has been excluded from the operations of the company, for power to construct in Derbyshire, on lands purchased by agreement all the apparatus necessary for the production of electricity and Mond gas for the northern part of Derbyshire. It has been intended to supply Glossop, New Mills, Disley, Buxton, etc., from a generating station near Macclesfield. The striking of Cheshire out of the Bill prevented that being used, and no specific station was mentioned in the Derbyshire area, which is now isolated from the others. The capital of the company, notwithstanding the restriction of its area of supply, will remain at its original figure of £1,500,000, and the Bill has been ordered to be reported for third reading.

Edinburgh.—A report is before the Works Committee in which the engineer says: "It is admitted by all public authorities that the best illuminating effect is obtained by a judicious distribution of comparatively small-power lamps, rather than by the concentration of high-power lamps at less frequent centres. The finest examples of this system are to be found in Paris, Berlin, Amsterdam, Cologne, and, in fact, one might say in all important towns and cities on the continent of Europe, where incandescent street-lighting may be said to reign supreme. In order, however, that a comparison may be made between the present electrically-lighted streets of Edinburgh and high-power gas-lighted thoroughfares, I have gone carefully into the matter, and I am prepared to advise the Commissioners to offer to supply lamps yielding an equal illuminating power to that given by the present electric arc lamps, including upkeep, lighting, cleaning, extinguishing, etc., at the rate of £10 per lamp per annum."

Bradford.—Last year's electricity fund revenue account shows a gross profit for the year of £40,057, against which £31,144 has been debited for interest and sinking fund charges, leaving a net profit of £8,923. Of this net profit £8,436 has been appropriated to depreciation account, leaving a surplus of £487. The total net profits since the commencement of the works in 1889 were £46,202, from which £31,911 was written off in respect of the depreciation of plant, leaving unappropriated the sum of £13,291, which has been accumulated in accordance with the provisions of the electric lighting order. Having regard to the very adequate amount provided under the head of depreciation (£32,911), in addition to setting aside £58,765 for extinguishment of debt, it must be conceded that the remaining surplus of £13,291 affords a sufficient argument from a financial point of view for the establishment by the municipality of this undertaking, which up to the present has proved itself capable of serving the public demand for this class of illumination and motive power.

Walton-on-Thames. — The clerk reported at the last meeting that, on perusing the draft agreement forwarded by the National Telephone Company in respect of the proposed fire calls, he found it to contain a clause which would involve the granting of wayleaves over all the Council's property for that or any other contract. He sought to limit them to the present contract, but the company wrote that they would be unable to connect Walton and Hersham unless the Council granted a free wayleave over the whole road. They pointed out that at Weybridge the local Council had agreed to a similar clause. The clerk observed that the company had always tried in their agreements to get something of the sort inserted, knowing that the Council objected to their putting up telephone poles promiscuously all over the parish. The Fire Brigade Committee reported that they had received a tender from Mr. V. C. Badois, of Windsor, for the provision of fire calls at Walton for £40, and at Hersham for £14, with £2. 10s. per annum for maintenance, and the erection of a line connecting Hersham with Walton for £50. 14s. They recommended that the tenders for the Walton and Hersham calls be accepted, but not that for the connecting wire. The report was adopted, it being stated that no further steps would be taken in regard to the suggested arrangement with the Telephone Company.

Hampstead. — With a view to improving the draught in the chimney at the electric lighting station, steam jets are to be fitted to two of the boilers, as an experiment, at a cost of £30. No objection will be offered to the Bill authorising the Board of Trade to make provisional orders for the supply of electricity in bulk by companies to local authorities and with reference to the compulsory power of purchase of land for generating stations. The borough accountant reported last week that the receipts from the electric lighting undertaking for the Midsummer quarter this year amounted to £6,850. 11s. 3d., as compared with £5,853. 5s. 4d. for the corresponding quarter last year. The chief electrical engineer reported that during the year ended March 31 the works costs had been reduced from 1·89d. to 1·61d., or ·28d. per unit; the coal being ·12d. less, which alone amounted to £1,296 on the units sold; that the works costs were this year £17,390 against £16,785 last year, or an increase of £605 for an increase in units sold of 465,301; the units sold the previous year (1901-2) being 2,127,173, against 2,592,474 for 1902-3; that these costs represented a percentage increase of 3·6 per cent. for 21·8 per cent. increase in units sold; that the total costs (excluding interest and sinking fund) were ·46d. per unit less than the previous year—reduced from 2·69d. to 2·23d.—being £23,832 for 1901-2 and

Digitized by Google

£24,096 for 1902-3; that the actual average total cost (including interest and sinking fund) per unit sold for 1901-2 was 4·06d, while for 1902-3 it was 3·92d.; and that the actual average revenue per unit sold for 1901-2 was 4·34d. against 4·33d. for 1902-3. The Works Committee reported that the consumption of electric light in the workhouse was now normal.

Manchester.—The members of the Electricity Committee of the Manchester Corporation made their annual inspection last week of several of the sub-stations and some of the work in progress in connection with the street mains under the conductorship of Councillor Bowes, chairman of this department of the electricity undertaking. At the Hunt's Bank battery station Mr. Bowes spoke of the advisability of doing away with it so far as the accumulators are concerned, and simply using the place as a balancing station. In that way a considerable saving would be effected. Mr. Bowes also gave some figures to show the magnitude of the committee's work. There were 20 sub-stations, 12 within the city and the rest in the districts which the Corporation have agreed to supply with current. The total outlay for buildings and machinery will exceed £200,000. Ten of the sub-stations are in connection with Dr. Kennedy's installation of 15,000 h.p. at Stuart-street, and the other 10 are in conjunction with Mr. Metzger's extension of 12,000 h.p., which is now being installed at Stuart-street. The total length of mains on March 31 last exceeded 288 miles of actual main and 633 miles of single cable (exclusive of service cable). The capital expenditure on mains amounts to £670,000. The area supplied by the present mains is approximately 18 square miles, but as the total area in which the Corporation have power to supply current will embrace 43 miles, it is evident, he thought, that the work of the department could not be regarded as approaching its completion. During the past 12 months the units of electricity sold for lighting and power purposes were 9,352,000, and for traction purposes 7,986,000—a total of 17,378,000. It is estimated that in the current year the total sales will reach 26½ million units.

Islington.—The last report of the Finance Committee contains the following report: "It will be observed that in the estimate of the Lighting Committee provision is made for £9,912 as the cost of street-lighting by electricity. In our last half-year's report we drew the attention of the Council to the fact that the price paid for current to the electric arc lamps—namely, 3½d. per unit—does not represent the cost of production and maintenance, and that, as a matter of fact, there is a serious loss occasioned to the undertaking by pursuing this policy. Last year the loss amounted to £6,015. As we understand that the Lighting Committee are about to recommend the Council to pay an increased price for current in order to prevent the recurrence of these deficiencies, we do not propose to add to the observations which we made in our former report, but we trust the Council will see their way to adopt the Lighting Committee's recommendation, and so enable us to properly establish a depreciation fund (which we would again remind the Council has not yet been started), and thereby comply with the obligations imposed upon and accepted by the Council in connection with every loan sanctioned." The Lighting Committee have reported as follows: "We have had under consideration a report from the borough treasurer upon the accounts of the electric lighting undertaking for the year ended March 31, 1903, from which it appears that a heavy loss is caused to the undertaking by reason of the current for public arc lamps being supplied at less than cost price, thereby precluding the provision of a reserve fund for depreciation. The exact cost of production per unit of electricity during the past year as shown by the accounts was 4·44d., while the charge made to the Council is only 3½d. per unit. We are of opinion that the Council should pay the actual cost of the electricity consumed for public street-lighting, and we therefore recommend that as from March 31 last the charge for public arc lamps be increased to the exact cost to the undertaking of production and maintenance."

Liverpool.—The electric supply accounts, after paying interest, show a credit of £61,141. 14s. 8d., which has been dealt with as follows: sinking fund, £27,726. 5s.; reserve fund, £10,000; renewal fund, £11,386. 9s. 8d.; contribution to rates, £12,029—£61,141. 14s. 8d. The reserve and renewal fund has been formed for the purpose of providing depreciation, and it has now a credit of £83,243. 19s. The loans, the repayment of which is provided by the sinking funds, are for periods of 42 and 25 years respectively—£500,000 for 42 years, this being the sum borrowed to purchase the undertaking and provide working capital, and £1,000,000 for 25 years. The whole of this last sum has not been raised or expended. The accountant in his report says: "With regard to the question of depreciation it is necessary to consider the different classes of assets which require to be maintained in order to keep the undertaking in efficient working order, and the amount expended on these assets. The provision made for the redemption of the debt by the sinking fund is, we consider, all that is necessary for certain assets, such as goodwill, land, and buildings. The remaining assets of the company consist of mains, and machinery, accumulators, meters, and electrical instruments. We are unable to arrive at the total expenditure on each class of assets, as the figures were not given separately in the company's balance-sheet. In the last balance sheet of the company mains and machinery stood at £214,578. The amounts expended by the Corporation are as under: mains, £377,549. 9s. 5d.; machinery, £267,121. 19s. 5d.; accumulators, £8,617. 9s. 11d.; meters, £20,221. 0s. 6d.; electrical instruments, £3,648. 9s. 1d.; old company's mains and machinery, £214,578; Garston undertaking (stations, mains, and machinery), £39,069. 4s. 1d.—total, £930,805. 12s. 5d. The engineer states that the depreciation on mains is very slow, and that it is more than provided for by the sinking fund in operation. It has, however, to be taken into consideration that in course of time, and as the demand increases, it may be necessary to replace some of the present mains and lay larger ones. This has already been required in some cases. The amount transferred this year for reserve and renewals is £21,386. 9s. 8d., this sum being equal to about 2·30 per cent. on the capital expenditure of £930,805, which is in addition to the provision of the sinking fund. The engineer informs us that, having regard to the fact that about one-half of the expenditure was for mains (not requiring any further provision than that provided by the sinking fund), it leaves a large portion of the reserve and renewal account to provide for depreciation on machinery account. He is of opinion that the course pursued by the committee, if continued, will leave the city with an undertaking free of debt and in working order at the end of the period over which the loans extend. The depreciation allowed is at a higher rate than that provided by the old company."

Electric Pumping in Collieries.—The Elswick Coal Company, of Newcastle-on-Tyne, have, we understand, placed a contract with Messrs. Ernest Scott and Mountain, Limited, of the Close Works, Newcastle-on-Tyne, electrical and general engineers, for a complete electric pumping plant for their North Elswick Colliery. The colliery company propose to take the electric current for driving the pumps from the town supply mains. The plant consists of a Scott and Mountain horizontal slow-speed, three-throw ram pump, delivering 400 gallons per minute against a vertical head of 800ft., the pumps being driven by a Scott and Mountain multipolar continuous-current electric motor being placed at the shaft bottom, and delivering to the rising main to bank. The current will be taken from the supply company's mains to the shaft top, then down the shaft to the pumps in-bye, these cables being of sufficient capacity to transmit 150 h.p. at 500 volts, the cables being insulated and heavily armoured for protection in the shaft. An installation of somewhat novel character, recently secured by the same firm, is for an electric conveyor of the Brothers type for conveying the railway material from side of the Victoria Falls on the Zambesia to the other, and also to be used in connection with the erection of a bridge which the Cleveland Bridge and Engineering Company are supplying. The electric conveyor consists of a hoisting and travelling gear, which runs upon a wire rope suspended from one side of the falls to the other, the distance being 830ft., and the weight of the rope and the load is supported at each end by balanced cantilevers. The wire rope is being supplied by Messrs. T. and W. Smith, of Newcastle, and the cantilevers and other work by the Cleveland Bridge Company. The current for driving this plant is generated by a steam-engine and dynamo on one side of the falls, the current being conveyed across the falls by a hard-drawn copper conductor, and collected by rollers as the traveller runs along. We are also informed that Messrs. Ernest Scott and Mountain are busy with mining work, having contracts in hand for Walbottle Colliery, Consett Iron Company, Limited, both these collieries being in the Newcastle district; also for Wigan Coal and Iron Company, Limited, near Manchester, the Llay Hall Colliery, North Wales, etc.
